[*St Jerome* after Albrecht Dürer, AD 1514]

1: Introduction and Background

[Chapter 1: Introduction.](#) (index.php, 60K)

Contents: What this site is about; the history of objections; collation and synthesis; the starting premise of this text; who I am, why I wrote this text; accolades; file hits.

[Chapter 2: A Synopsis.](#) (syn.php, 63K)

Contents: A synopsis of the website; verification of notions by others; items completely missed by other researchers.

[Chapter 3: The Osiris Mystery.](#) (intro.php, 71K)

Contents: The Osiris mystery; David Talbott's "Saturn Theory"; Wal Thornhill's plasma connection; the combined model and objections.

[Chapter 4: The Nevada Conference.](#) (nevada.php, 49K)

Contents: The Nevada Conference; a comet's path; ice cover; seasonal plants; periodic extinctions; a new set of postulates.

[Chapter 5: The Absu and Speculation.](#) (cos.php, 67K)

Contents: The equatorial rings detailed; methods of forming postulates; accusations of speculation; Peratt's wrench in the works.

[Chapter 6: Alternate Cosmology.](#) (planets.php, 61K)

Contents: The standard and some alternative cosmologies; Saturn as a misfit in the Solar System; life on Earth.

2: Established Archaeology

[Chapter 7: Ice Ages and Humans.](#) (ice.php, 70K)

Contents: Recent glaciations; Homo erectus; the Acheulean Handaxe; Homo sapiens.

[Chapter 8: Tunguska and Chicxulub.](#) (tung.php, 128K)

Contents: preliminary planet interactions; stratospheric dust; Tunguska; Chicxulub; Grand Canyon; a Great Lakes atomic detonation.

[Chapter 9: Event of the Younger Dryas.](#) (dryas.php, 130K)

Contents: Firestone's paper of 2007; the Laurentide Ice Sheet; a likely sequence of events; the Great Lakes; the Carolina Bays.

[Chapter 10: The Peratt Column.](#) (peratt.php, 105K)

Contents: The Peratt Column; the Opossum; Nazca lines; Ley lines; Job; Carnac; Manu; Lepenski Vir; Sheela Na Gigs; Mari; Neith; Oannes; Kojiki; Cerberus.

[Chapter 11: A Timeline and Gimbutas.](#) (gim.php, 84K)

Contents: Earth placed below Saturn; the Hypsithermal; the Saturnian planet stack, a time line, Marija Gimbutas and Neolithic figurines.

[Chapter 12: Saturn and Archaeology.](#) (arch.php, 91K)

Contents: Revisiting the Acheulean Hand Axe; the caves of Lascaux and others; Catal Hoyuk transitional period.

3: Mythology and Remote Antiquity

[Chapter 13: The Creation.](#) (polar.php, 99K)

Contents: Starting from Chaos; an unexpected flood; the egg; creation; the eye of Ra; petroglyphs; the city on the horizon.

[Chapter 14: The Start of Time.](#) (time.php, 62K)

Contents: The God visits Earth; the start of time; the first land; Horus the Hawk; gifts of the Gods; living in paradise.

[Chapter 15: The Era of the Gods.](#) (gil.php, 107K)

Contents: The King list; dating the Age of the Gods; barrows, henges, temple platforms.

[Chapter 16: The World Flood.](#) (flood.php, 84K)

Contents: The worldwide flood of 3147 BC; the battle of the Gods; the Absu.

[Chapter 17: The Gods Leave.](#) (leave.php, 62K)

Contents: The Gods leave; return of the Axis Mundi; a new era.

[Chapter 18: Pyramids and Henges.](#) (oldk.php, 122K)

Contents: Horus on his mountain; the Palermo Stone; the pyramids; barrows after 3100 BC, henges after 3100 BC.

4: Narratives of Ancient History

[Chapter 19: The Midnight Sun.](#) (sun.php, 104K)

Contents: The Midnight Sun; histories; something is missing; developing consciousness; the flood of Noah.

[Chapter 20: The Flood of Noah.](#) (noah.php, 123K)

Contents: The flood of Noah reconsidered; the fall of the Absu; a flood from the Sky;

the Moon on fire; the extinction of Jupiter.

[Chapter 21: Day of the Dead.](#) (jup.php, 162K)

Contents: Blood and alcohol; the ten suns; Day of the Dead; Tower of Babel; Return of Mars; Sodom and Gomorrah.

[Chapter 22: The Exodus of Moses.](#) (moses.php, 145K)

Contents: The terror of Venus; Moses and Yahweh; the Ark; the psychosis of Yahweh; Joshua.

5: The Start of Modern History

[Chapter 23: Destructions by Mars.](#) (quet.php, 138K)

Contents: Destructions by Mars; calendar reforms; a blast from heaven.

[Chapter 24: The Tablets of Ammizaduga.](#) (bolt.php, 107K)

Contents: The Tablets of Ammizaduga; the bolt from Jupiter; the fall of Phaethon; the twins.

[Chapter 25: The Hour of Phaethon.](#) (hist.php 110K)

Contents: Dating the thunderbolt of Phaethon; the start of history; the sky in disarray; change in the equinox.

[Chapter 26: Hezekiah and Babylon.](#) (star.php, 133K)

Contents: The star in the crescent; Hezekiah, Babylon; philosophy, religion, science; the presence of God.

[Chapter 27: The Sibylline Star Wars.](#) (sib.php, 76K)

Contents: The Great Year, new locations of the stars; Nonnos; two meteors; Denderah.

6: The Parallel Mesoamerican Record

[Chapter 28: Language and Causality.](#) (lang.php, 137K)

Contents: Consciousness; languages; becoming human; boat people; children.

[Chapter 29: The Maya Calendar.](#) (maya.php, 76K)

Contents: The beginning of time; the first calendar; Tzolkin; Haab; Long Count; Katun Cycle, four ages.

[Chapter 30: The Chilam Balam Books.](#) (chil.php, 230K)

Contents: The Katun cycle, the Thirteen, the Nine; Nine Lives; 2349 BC; the burning tower; 8th century; Katun 3-Ahau; Nine Fragrances.

7: Long Range Mesoamerican Astronomy

[Chapter 31: The Olmec Record of the Past.](#) (rec.php, 144K)

Contents: A 40,000 year record; the three-cornered stone; the endless nights; God wakes up; survey of the world; the Third Creation.

[Chapter 32: Olmec Site Alignments.](#) (olmec.php, 160K)

Contents: A crisis with the Sun; Izapa; Edzna; San Lorenzo; La Venta; Teotihuacan; Monte Alban; Pleiades.

[Chapter 33: The Day of Kan.](#) (kan.php, 106K)

Contents: The Day of Kan; the course of the "may"; the third conquest; summary.

[Chapter 34: The Popol Vuh.](#) (popol.php, 152K)

Contents: Northern Gods, southern Gods; Seven Macaw; Zipacna and Earthquake; Hunahpu and Xbalanque; the ballgame in Xibalba; Tulan.

Appendixes

[Appendix A: Notes on Chronology.](#) (chron.php, 173K)

Contents: Sources for dates of the King lists; parallel chronologies; calendars; Carbon-14 dating; Precambrian.

[Appendix B: The Celestial Mechanics.](#) (mech.php, 190K)

Contents: Asteroid belt; outer orbits, inner orbits; plasma interactions; 52-year cycle of Venus; close encounters of Mars.

[Appendix C: Mesoamerican Site Alignments.](#) (align.php, 92K)

This is the file of alignment calculations referenced in Chapter 32, "Olmec Site Alignments" above.

[Appendix D: Change in the Axis.](#) (axis.php, 35K)

Contents: A 25-degree inclination; megalithic construction in response to disturbances in 2000 BC by Mars.

[Appendix E: Polar Relocations.](#) (flip.php, 62K)

Contents: The source of the problem; Earth as a gyroscope; flipping the pole; frozen mammoths; other polar relocations.

[Appendix F: The Palette of Narmer.](#) (narmer.php, 34K)

Contents: Reading the Egyptian Palette of Narmer.

[Appendix G: Deep Impact.](#) (deep.php, 32K)

Comet Tempel 1; Deep Impact; predictions; the fireworks; the aftershocks; weeks later; months later; years later.

[Appendix H: Other Cosmologies.](#) (other.php, 57K)

Sitchin; Patten and Windsor; Ackerman; Clube and Napier.

[Appendix I: The Canopus Decree.](#) (can.php, 31K)

Contents: The Canopus Decree; Sothic dating; Venus rising; Sirius rising; implications; further notes.

[Appendix J: Expanding Earth.](#) (exp.php, 16K)

Contents: Pterodactyls; expansion; S. Warren Carey; questions.

[Appendix K: Venus and Epidemics.](#) (epi.php, 18K)

Contents: Spanish flu; Lockyer Observatory; diseases from space.

[Appendix L: Long-Range Chronology.](#) (long.php, 17K)

Contents: From 4.6 billion years ago.

[Appendix M: The Red Sirius.](#) (sir.php, 16K)

Contents: Ptolemy; the Maya; Gregory of Tours; Al-Sufi; Sima Qian and Yu Ji-cai.

[Appendix N: Age of the Universe.](#) (age.php, 6K)

Contents: The Milky Way; the local group; the Virgo supercluster; the visible universe.

[Appendix O: List of Books.](#) (books.php, 47K)

Contents: Relevant books on allied topics.

[Appendix P: List of Links.](#) (links.php, 16K)

Links pertaining to the Saturnian theories.

Recovering the Lost World, A Saturnian Cosmology -- Jno Cook

Chapter 1: Introduction.

Introduction

*"... a large planet stood above the
North Pole for a very long time."*

That is what all the mythology throughout the world uniformly states -- mythology from every nation, region, tribe, and period, in thousands of languages, in hundreds of forms, from every continent -- they all resound, "a large planet stood above the North Pole for a very long time." Every country, that is, except those more than 10 degrees below the equator.

The mythology of regions as far removed from each other as Siberia, North Africa, and Guatemala all agree. If the mythology is true (and what other conclusion could be drawn), then the fact that a large planet stood at the northern horizon is true. How this could be, is a matter which this text will attempt to address.

As others have also done, I will suggest that this planet was Saturn. From other sources we can estimate that the planet Saturn moved on a wildly elliptical path around the Sun in the remote past, entering the Solar System at very long intervals. Some time in the last 3 million years, perhaps after passing Jupiter, Saturn was drawn into a much closer orbit around the Sun, very near Earth. And from 10,900 BC, Saturn captured and held the Earth in a sub-polar position lasting until 3147 BC, when Earth broke away.

*"You cannot reason a person out of a position
he did not reason himself into in the first place."*

-- Jonathan Swift

This is, however, exactly what I will attempt to do with this text: I will try to tell the actual history of the world and humanity -- in spite of the knee-jerk reactions and spitting noises you may see and hear from those who feel they know better. This is not my story, but the efforts of a great many people, and based on evidence in plain view.

My starting point is the postulate that myths throughout the world should be taken at face value. For the recurring worldwide mythology this is almost completely obvious. No other form of meaning can be assigned.

An attempt to apply local culture and limitations to mythology almost always meets with failure because of a lack of appreciation of the constant refrain of identical themes by peoples who have remained completely foreign to each other -- who have never had cultural contact. Any theory of mythology based on limited and local origins will fail to translate to the hundreds of additional instances across the world. This holds true also for all the variations of analogies that are presented to us as explanations of mythology: notions of ritual, model behavior, allegories of nature, personifications of the weather.

This leaves only the historicity of mythology. It has an evidential character which is absolute. If myth tells us that a large planet stood above the northern horizon, then we are stuck with this as fact. It cannot be negated, waived aside, or turned into an allegory. It only remains to investigate how this could have been so. Mythology is history.

Of course it is not always astoundingly clear. Frequently we are met with wording which is no longer understood, and frequently it will be easier for us to elicit metaphors from our own culture and language in an attempt to explain the inexplicable. This is probably the most frequently made mistake in investigating mythology.

Mythology represents a history stretching into the depths of time. On the other hand, the accepted mainstream history is a 2000-year record of rewriting and softening of facts, created for the sake of sanity and the comfort of your soul. It is a history of the survivors, written to cover their suspicions and allay any fears. It was initiated with the scrutiny of myths by Plato, and has grown since the Renaissance, culminating in the scientificism of the last hundred years. If the narrative based on conventional wisdom suits you, you should stop reading here, for the story presented here will get progressively stranger. Be comforted, though, that this will not be about crashing meteors, undetected planets, or visits by aliens.

The story of what has happened to Earth has no plot and no direction, and makes no sense. This is, in fact, one of the basic parameters of myth: there is no encompassing teleological

design, it does not teach, it does not glorify, it does not propose any new arcane knowledge. It only recounts the past.

Returning now to that large object in the sky:

"The evidence of myth which points to Saturn having once occupied a position above Earth's north polar regions is voluminous. There is not a race on Earth that has not preserved at least one account which states as much. According to this evidence, Saturn occupied a central position in the north celestial regions. It rotated, and rotated widely; but other than that, it was immovable.

-- Dwardu Cardona (1978) [\[note 1\]](#)

It rotated, in fact, in a circle around the polar axis. From a vantage point 15 to 20 degrees of latitude further south than Mesopotamia and Egypt, the Guatemalan *Popol Vuh* recounts that it rose out of an ocean and sank back into it every day for what appears to have been some 2500 years starting 10,900 BC.

What This Site Is Really About

This is a cosmology. It is not the traditional handed-down narrative passed off as the history of everything. It is an alternative -- one which is very extensive -- quite complete and accurate. My starting premise was to hold worldwide mythology as absolute and believable, although at times very obscure. My method subsequent to this starting position was the collection of myths and iconography, and then to develop, in turn, a chronology of events (Appendix A) and a likely process of celestial mechanics (Appendix B). At that point I started a narrative.

As an alternative cosmology the narrative has remained within the accepted boundaries of physics and dating. This has continued to surprise me as the details developed. I have had no problem with the integration of the iconography, the odd events, and the obscure mythological phrasings. Other alternative cosmologies have had to resort to analogical and metaphorical readings of the past, or suggest improbable exploding bolides.

In the realm of orthodox cosmology, since 2007 we are seeing astrophysicists, atomic physicists, and archaeologists doing exactly that -- that is, suggesting improbable exploding bolides in attempts to explain an event in 10,900 BC which caused the complete destruction of all the megafauna of the North American continent, plus an absolutely stupendous conflagration which vaporized everything organic and melted rocks. To explain these data, published papers have alternately posited an influx of meteors, aerially exploding iceballs from space, the propagation of flaming shockwaves from kinetic energy conversion in the air (even though there is no such thing), and the influx of atomic particles from a supernova. The establishment scientists are lost, and by their own admission they are grasping at straws.

But there is a straightforward answer. It lies in the predictable effects of repulsive electric force between planets when their plasmaspheres touch, that is, line up with each other. And this is what I will propose, even though you are very unlikely to be in the least familiar with this.

This is so because for some almost inexplicable reason, such forces and such interactions cannot be conceived of or even discussed within the realm of consensus science, especially in astrophysics, despite the fact that electric fields have been the stock of electrical engineering since the early 19th century. Ralph Juergens wrote in 1972:

"When the moment arrived for the inevitable encounter [between plasmaspheres], [the] sheaths would make contact. Unleashed electric fields would clash. Almost instantly, forces immeasurably greater than gravitation would be brought to bear on the charged bodies. Cosmic thunderbolts would flash between the bodies in an effort to equalize their electric potentials."

-- "Reconciling Celestial Mechanics and Velikovskian Catastrophism" (*Pensee* 1972)

The forces "immeasurably greater than gravitation" are real. They are electrically repulsive, billions on billions of times stronger than gravity, and they operate instantaneously (not "almost instantly"). The effects do not last long, for a charge of the opposite polarity would quickly be induced. After a delay (perhaps of minutes) the "cosmic thunderbolts" would follow -- a charge equalization. Since this is the movement of electrons and protons across space it will involve a travel time delay.

Juergens continues with:

"The list of unthinkable disastrous effects that would result could go on and on. The point to be made, however, is that Worlds in Collision [Immanuel Velikovsky's book] -- at least in my opinion -- documents historical evidence to indicate that phenomena associated with space-charge sheath destruction were actually suffered and survived by peoples of antiquity."

The repulsive force between planets with like charges (or attractive force for unlike charges) is about 39 orders of magnitude greater than the attractive force due to gravity -- thus it is greater than gravity by a factor (a multiplier) of 10 to the 39th power -- 10 followed by 39 zeros. Gravity drops off with the square of the separation distance. That is also true for point electric charges, but for charged surfaces the force drops off as the inverse of the separation distance.

It is here taken for granted that all Solar System planets carry an extremely high negative charge -- at their surface (or in the near-space region). This has been known for Earth for a long time, but this awareness is only slowly creeping into the field of celestial mechanics. The planets keep electrically isolated from each other by means of their enclosing

plasmasphere (what Juergens called a space-charge sheath above) which for Earth is approximately equal to the Earth's magnetosphere (thus with a radius generally 20 times the diameter of the Earth). For comets this is called the coma.

In popular mainstream astrophysics the "plasmasphere" is frequently represented as consisting only of the Van Allen belts, an equatorial toroidal region of charged particles surrounding the Earth. The visible comas and tails of comets contradicts this, as does the analysis of the electrical properties of the space surrounding the Earth which is based on satellite measurements. See for example J. H. Piddington *Cosmic Electrodynamics* (1969) and others.

It is absolutely astounding that, in the 40 years since 1972, not one author among the writers in catastrophism has taken proper account of the repulsive forces Juergens first introduced into the literature.

I should point out also, that when Juergens writes "almost instantly forces immeasurable larger" and "cosmic thunderbolts would flash between the bodies," most readers fail to realize that there is a delay between these two separate actions. It seems to have been universally assumed that the thunderbolts result instantaneously from sensing a difference in potential, perhaps because one sentence follows directly on the other.

The difference in potential which causes the "cosmic thunderbolt" does not exist until an opposite charge is induced at one of the planets (which takes time) and the thunderbolt is further delayed by the time it takes for electrons and ions to travel from one planet to the other. And I should also point out that interplanetary lightning strikes are almost benign compared to the destructive interaction due to the *likeness* in potential -- the electric repulsive forces.

What is perhaps more astounding is the sheer lunacy of Velikovskian researchers, almost none of whom had the slightest background in physics or engineering, in insisting, for a span of thirty or forty years (as did Velikovsky), that somehow an interaction of magnetic fields between planets would account for changes in the Earth's orbit and Earth's axial inclination -- despite the fact that the two planets accused of interfering with Earth, Venus and Mars, have no magnetic field.

Much of this was due to Velikovsky's insistence on the primacy of magnetic fields while ignoring electric fields. Magnetic fields remained in the conceptual foreground as long as it was thought that the planetary interaction genuinely involved "collisions" or "near collisions." Everyone has played with magnets and understands their effectiveness at close distances. Almost no one has any feel for the enormous wallop packed by electric charges at great distances.

As I have discovered over and over again, the theorists (mostly "story tellers") of the catastrophic events first proposed by Velikovsky have seldom given much thought to the

obvious: Venus could not have made a close approach to Earth without overall destruction of both planets.

The retellers of Velikovsky's narratives have held his book as Bible truth, for a number of reasons: in order to remain in his good graces, from a deficiency of imagination, and from the complete lack of knowledge of physics and electricity. There has been a whole generation of "researchers" who have never given a single thought to alternate scenarios which would generate the same descriptions from antiquity.

This is so like the established mainstream notions of today's science orthodoxy, which holds that things always were as they are today. No other condition can enter the imagination and certainly cannot present itself as fact. Yet all indications from the recent past are that things were different. Even very recently the arrangement of the Solar System differed markedly from today.

What is most important about the changes in the arrangement of the Solar System, many of which were catastrophic, is the cultural and psychological reaction of the people of Earth to these events. The last 1000 years of the period when Saturn visually stood above the north horizon (4077 BC to 3147 BC) were beneficial and was remembered as the "Era of the Gods." Subsequent human history has been a singular effort to regain that Paradise. This period was followed by a series of adjustments in planetary orbits, some of which also had significant destructive effects on Earth and traumatic psychological effects on humans.

Humans changed after Paradise closed in 3147 BC. It was not just the rapid changes which we identify as civilization since 3147 BC, but also the acquisition, over the next three millennia, of subjective consciousness. The response to catastrophic events determined how we became fully human. To say it would have happened anyway does not hold up. There could have been any number of other outcomes. We could still be chipping flints. After all, we did that for more than a million years.

Disbelieving History

Of course, many will disbelieve and deride the concept of an alternative history, for it was not learned at their mother's knee. Most people have never actually tested the logic of the mainstream scenarios. The orthodoxy just "feels so right," because it is promulgated by a consensus of the established community of scientists, and especially by astronomers and historians. These two disciplines, it should be pointed out, operate without a physical object they can lay their hands on and are thus relegated to considering their subject of study mostly within the vacuum of the mind.

The physicality and history presented by the establishment is so here and now: it is everywhere and as accepted as religion (and with as little basis in fact). Any alternative to the conventional cosmology is thought to be impossible.

So, if you need to ask me: none of the information presented here has been published as scientific opinions in peer-reviewed professional journals. There are no clinical trials underway. My readers either understand and agree or they maintain an absolute silence. Over the last fifteen years I have only been faulted once -- for my claim that mountains existed before the Biblical flood of Noah.

Ralph Juergens, in 1972, in a brief evaluation of reasons for the "emotional outburst from the community of astronomers" (in particular) to the writings of Immanuel Velikovsky, wrote in summary about the scientific community:

"... I believe it is only fair to acknowledge an underlying and totally sincere scientific disbelief in the historical record."

Juergens here plainly translates *mythology* to *history*, as I do. Let's face the facts: the major portion of the historical record of mankind is our mythology. But this is not how most people understand mythology, including, or perhaps especially so, the scientific community.

To most people mythology is an exercise in didactic preachings on ethics and morals, akin to religious education. This represents an attitude initiated with the skepticism of Plato, and most recently reinforced by Joseph Campbell with his 1949 book *The Hero of a Thousand Faces*.

To Campbell myths are universal truths presented in symbolic language. But to everyone else myths are insubstantial and unreal. They have no relationship to anything in the physical world, and quoting the fanciful language of ancient sages doesn't prove anything about the real world of astronomers and physicists.

But it may be more than that. It is, in fact, difficult to understand the violent reaction to Velikovsky and his book as being solely based on a disbelief in history or in misconceptions about mythology. The reaction that was evoked primarily seemed to consist of predictable psychological defenses to perceived attacks. The astronomers had been bested by an outsider.
[\[note 2\]](#)

The History of Objections

Efforts to debunk the cosmologies proposed by Immanuel Velikovsky (*Worlds in Collision* published in 1950), as well as David Talbott (*The Saturn Myth* of 1980), and work by Wallace Thornhill, Don Scott, and others have continued unabated for 60 years by those who need to convince themselves that they live in a stable Universe where things have always been as they are today.

Even recently, in 2012, more books are being published which are intended to show the terrifying influence of Velikovsky, such as Michael Gordin's *The Pseudoscience Wars and the*

Birth of the Modern Fringe. Gordin equates Velikovsky's writing (as the publication blurb announces) with "other fringe doctrines, including creationism, parapsychology, and more."

Another book, Laird Scranton's *The Velikovsky Heresies: Worlds in Collision and Ancient Catastrophes Revisited*, supports Velikovsky, but with little effort at an in-depth analysis. Most of the writing simply rehashes the favorable reviews of the 1960's.

Whereas Velikovsky's *Worlds in Collision* is listed under "Astronomy and Astrophysics" at Amazon.com, the above books are listed under "Religion and Spirituality" and "Christian Books and Bibles." As ever, the ability to influence religion is the greatest fear.

Today it is absolutely taboo to cite the work of Velikovsky in any scientific papers. This is observed with a religious zeal. Alfred de Grazia suggests it is a symptom of "collective neurosis" among astronomers and especially among archaeologists. Archaeology deals with actual objects but derived time periods. Velikovsky's later theory of displaced archaeological dates was very threatening. The violent rejection and debunking by professionals, whether they be astronomers, historians, or linguists, is perhaps the best certification of the very likely veracity of new ideas.

The AAAS and the Heretic

I should add an additional note on Velikovsky, since people tend to hold pre-formed opinions of him which are derived from rather scurrilous condemnations by the scientific community, in fact, almost entirely due to a symposium held by the *American Association for the Advancement of Science* in 1974 -- twenty four years after publication of Velikovsky's book *Worlds in Collision*.

The symposium was presented as the ultimate excommunication of Velikovsky in a trial of scientificisms performed by the AAAS. Velikovsky was on a panel with five scientists who were to consider his ideas. He was allowed to speak for 30 minutes, but was then followed by four anti-Velikovsky panelists who spoke against his ideas for two hours. The press loved it, extravagantly quoted Carl Sagan, and held Sagan as the winner.

At the time of the symposium, 24 years after his first publication, all too many predictions and corollaries formed by Velikovsky had been verified, based mainly on data gathered from the space program. Meanwhile Velikovsky had been giving standing-room-only lectures at universities and had become an embarrassment to astronomy.

James Hogan, in *Kicking the Sacred Cow* (2004), writes:

"Organized science had tried every tactic of distortion, evasion, misrepresentation, intimidation, vilification, and suppression of evidence to slay the monster that threatened the entire foundation of the collective uniformitarian world-view and mind-

set.

Hogan is not exaggerating. As he mentions:

... after twenty years, interest in Velikovsky's theories was not only getting stronger with the apparent vindication from all quarters that was getting past the censorship and receiving coverage, but Velikovsky was no longer virtually alone. Scientists from many disciplines were beginning to organize in his defense, bringing the message to a new generation of readers and students."

But the AAAS symposium would bring all of that to an end. I won't go into details. You may readily find them. The end result was a disaster for Velikovsky's reputation.

The AAAS printed up the proceedings, but without allowing responses from Velikovsky. The papers of the 1974 AAAS conference appeared in Donald W. Goldsmith, *Scientists Confront Velikovsky* (1977).

The introduction by Isaac Asimov begins with, "What does one do with a heretic?" Indeed! Asimov's essay goes on to suggest that miracles by God are a more likely solution to the catastrophes recorded in the Bible: "the hypothesis that divine intervention caused the miracles."

In later recollections by Sagan in *Broca's Brain* (1979), however unbelievably, the television-personality astronomer accused Velikovsky of religious delusions: "Velikovsky attempts to rescue not only religion but also astrology."

Although presented as ridicule, that statement incorporates the hidden fear of the astronomers and scientists: that Velikovsky's book was an effort to tie science and astronomy to Bible fundamentalism -- just when the scientists had thought they had rescued humanity from such blundering behavior and superstitions. As Robert McAulay wrote in "Extra-Scientific Dimensions of Science" (*Society for Interdisciplinary Studies (SIS) Review*, 1979):

"Velikovsky can be further comprehended. Of special significance is the fact that Velikovsky's catastrophism is seen by a number of eminent scientists as raising once more the spectre of the arch-nemesis of modern science: Christian fundamentalism."

Of any number of analyses I have read of the controversy surrounding Velikovsky, only those that give voice to the idea that, inadvertently or not, Velikovsky was supplying evidence in support of Bible fundamentalism, made sense -- and this despite the fact that Velikovsky was an atheist and basically anti-religious. But nevertheless fundamentalist ideas were being read into his work.

"Perhaps the key factor is that Velikovsky's theories are regularly linked with literal interpretations of the Bible, and are thus viewed as being of one piece with

'fundamentalism,' rather than as an historical use of the Bible and other sources."

McAulay continues:

"Along these lines, the number of times that scientists refer to the religious implications of Velikovsky's work is striking."

What is happening here? I think we are seeing such violent reactions to Velikovsky because the real reason for being so upset with him was to be kept secret and hidden. It was a reaction to the invalidation of the life's work of the scientists. Let me quote Edward T. Hall who, in *Beyond Culture* (1976), sums up the reaction to telling people that their world is misconceived:

"When other people call attention to ... perceptual differences, suggesting that the world is not as one perceives it, these observations can be unsettling. To do so is to suggest that a person is incompetent, not properly motivated, ignorant, or even infantile."

This is exactly what Velikovsky's *Worlds in Collision* did to the astronomers of the USA. The unspoken implications were that they were incompetent and ignorant, and they were being told so by an outsider.

Many wrote also about the AAAS exercise in exorcism. Lynn Rose, who was present at the symposium, but not allowed to comment, produced articles in *Kronos*, "Just Plainly Wrong," in 1977 and 1978.

Charles Ginenthal spent nearly a decade researching *Carl Sagan and Immanuel Velikovsky* (1995), which took up Sagan's points of disagreement with Velikovsky.

Alfred de Grazia authored, with Ralph Juergens and Livio Stecchini, *The Velikovsky Affair* (1966, 1978), including an update for the AAAS Symposium experiences. [\[note 3\]](#)

But all to no avail. There is no right and wrong in any of this, there is nothing to prove. My feeling is that the participation by Velikovsky in the symposium was a mistake which backfired by producing astoundingly bad press. It was the single largest mistake that Velikovsky and his supporters ever made, and perhaps the only one. Nothing will ever be proven through debate of theories.

There is no decisive proof to be had. The establishment owns a complete culture of empty fictions -- the Big Bang, Black Holes, Dark Matter, the Dark Ages of Greece, Sothic dating, and the pretentious paradigm of Absolute Gradualism. None of it is real, yet all of it is accepted as Gospel Truth. What the Velikovskians needed was marketing by professionals -- not some self-generated precepts of decisive proof of their theories. As de Grazia noted, in *Cosmic Heretics* (1984):

"The practice of advancing priorities is childish and the idea of proving a general cosmogony by a race of claims is ludicrous. There can be no crucial test or event."

Almost the complete series of objections presented by Wikipedia today is in error or is of no current import. While many of the initial celestial suppositions of Velikovsky have proven to be wrong, his corollaries have been correct, despite the fact that in the 1950s the astronomical establishment absolutely railed against them.

One outstanding and contrary element, from Wikipedia, however, is the following:

"He proposed that electromagnetic forces could be the cause of the movement of the planets, although such forces between astronomical bodies are essentially zero."

These forces are, in fact, zero, and will remain hidden and inactive within the shielding plasmaspheres of the planets. However, if the plasmaspheres of planets of nearly equal surface potentials intersect, then the forces are absolutely stupendous, so much so that even today many catastrophists shun all mention of repulsive forces between planets, for, without a grounding in electric field theory, it simply cannot be imagined how these forces act or how large they could be. They are, in fact, billions on billions of times greater than gravitational forces. This was how Venus "collided" with Earth at a distance of 20,000,000 miles (32,200,000 km).

I would never have made any sense of any of this were it not for the elucidation provided by the writings of Ralph Juergens, Wal Thornhill, and Don Scott, which readily explain virtually all the planetary interactions in electrical terms. Additionally, the mythological aspects of my model developed out of writings and theories developed by David Talbott and Julian Jaynes, to whom I am also greatly indebted. [\[note 4\]](#)

Validation

I have done little more than connect the details of research by others, which I reference in these first chapters. As a result, very little of the following essay is speculative. Almost all of it can be backed up with currently available data and the theories of "Cosmic Electrodynamics." This last is otherwise known as plasma theory, which is based on long-standing concepts in electricity and field theory, and data gathered with space probes. But don't worry, I'll keep it simple.

Any speculation will be identified as such. More will be based on common sense and intuition. I'll detail my methods in a later chapter.

There have been numerous changes to this text, for many facets of the past have only slowly revealed themselves over the span of the last 10 years. But the changes are almost all in details. The overall narrative has remained the same since 2003.

Last, the reader will be looking for proof of my claims. Proof of specific ideas is at times overwhelming and at other times very sparse. But the strongest indication for the validity of the overall claims made here lies in the fact that the complete set of ideas explains almost all mythology with great ease, including many concepts which have remained entirely obscured under uniformitarian consensus and even ideas which have remained inexplicable to alternative cosmologists despite years of investigations.

The Velikovskian studies have generated a number of magazines over the years, from 1972 through to today. Much of this is available as a CDROM at [\[www.catastrophism.com\]](http://www.catastrophism.com) of texts from past issues of *Pensee*, *Kronos*, *SIS Review*, *SIS Workshop*, *Horus*, *Aeon*, *Velikovskian*, and *Thoth* (with the last also at [\[othergroup.net/thoth/\]](http://othergroup.net/thoth/). There are over 4000 published articles directly concerned with these topics (and another 10,000 as news reports and uninformed drivel).

Most of these magazines have gone under. Only the Society for Interdisciplinary Studies (SIS) publications have been added to the CDROM as updates. The CDROM is perpetually out of date, and much of the graphics are missing. Why all of this information is being hoarded is curious. It should be freely made available on the internet as the most important and intellectually liberating concepts to have been developed in the last 1000 years.

In this essay I am providing no more than cursory information on what has already been written about extensively by others. I have limited references to their work because there is no reason to weigh down a narrative with thousands of "op cit" and "ibid" footnotes -- which are too unrevealing and foster the decontextualization of primary sources.

Therefore, I did not include sources for most of the information in this text since all I am doing is remapping areas already explored by others and all of it is readily available, although scattered over many sites and books.

On the other hand, what is missing from the wide-ranging efforts of other researchers is a coherent analysis of Mesoamerican sources. I have added this. But it could not have been done without the prior exposition, by others, of the sequence of events as described in Egyptian, Mesopotamian, Indian, and Chinese sources. I am also indebted to earlier commentators and chronographers from Augustine to Ussher.

This site is thus in a large part a collation and synthesis of the efforts of many other people to recoup the past and a restatement of their work. Most of the information has been published previously, although I could not accept all of the writings. A portion of these prior resources is conjectural when based on unsound chronology, impractical when based on poorly understood physics, and pure fantasy when based on analogies.

And thus, in an attempt to put it all together, I am providing a narrative text of findings which I feel are acceptable and adding what I feel is missing: a sound chronology, realistic mechanics, and an extrapolation to events not recognized by many researchers.

I collected available material and put it in order, and, when it no longer made sense, started writing. Overall, the construction of a cohesive narrative resolved every significant outstanding "problem" which other researchers had run into, although at times it took months to find a solution -- however obvious it eventually turned out to be.

I should warn that the subject matter here is not any sort of accepted science narrative. It is a cosmology based on a set of reasonable starting postulates. The postulates, like those of any cosmology, are untestable. However, established theories of physics can be applied to these and this results in an amazing concordance of information in agreement with the initial postulates, historical recollections, and observable facts. It is this which confers validity on the explication pursued here. It suggests sensible answers to questions about the history of mankind, the Earth, the Solar System, and the Universe which have remained completely unanswered by the traditional "handed-down wisdom." The sum total of the conclusions derived here goes much further to constitute a cohesive "world-view" than traditional opinions and narratives have done.

This website takes Velikovsky's groundbreaking work, his book *Worlds in Collision* (1950), as a starting point for the development of a history of antiquity which answers more questions than any other alternative cosmology, and certainly more than the commonly accepted uniformitarian cosmology.

Many catastrophists still accept Velikovsky's ideas. Others, such as David Talbott, Wall Thornhill, and Dwardu Cardona of the Thunderbolts group, hold that nothing ever happened after the so-called Polar Configuration came apart in 3147 BC: not with Venus in 1500 BC or with Mars after 800 BC. Considering (as I do) the huge assembly of mythology which recounts these events, spread over three continents, with Mesoamerica detailing this with identifiable dates, I am astounded at the oversight. What else could be expected as the winding down of the cataclysm of 3147 BC with the removal of Saturn except further adjustments and interactions of the loosened planets?

I also came to the conclusion that some very large aspects of the past -- including some immense events -- had been overlooked by some of the most able researchers. I discovered and detailed the fall of the Absu in 2349 BC and the resurrection of Jupiter, and discovered the blazing of Venus and Mercury in 685 BC and the plasmoid delivered from Jupiter to the Sun (to the exact date and hour). Both the Velikovskians and the Thunderbolts people have remained completely unaware of these particular events -- and not that both could not have been discovered among available texts. You will not have to be able to read dead languages to find the information.

This cosmology can explain everything from the geology of the Earth to the astrophysics of the Solar System. Other people have expanded on separate facets extensively. My first concern was to provide a chronology and a mechanics (see the Appendixes A and B). The connecting narrative came later. In this narrative my main interest has been to trace the origins of contemporary cultural practices. Of greatest importance, from my point of view, is

that a Saturnian cosmology provides an explanation of the actions and thoughts of our ancestors and insight into our contemporary behavior and thinking.

Let me state at the outset that I have no particular axe to grind, no politics to promote, this is not a "creationist's young earth" thesis, I do not hold to extraterrestrial interventions, I have no religious or theistic proposals to make, nor do I put stock in the "Elohim" of the Old Testament. I'll remain within accepted physics -- I will not propose new solutions to gravity or offer new "forces" for you to consider, or have planets arbitrarily leave their orbits. And I'll use accepted dates and dating.

I started this essay in late 2001. I never meant to write as much as I did, but people asked, "So what came before 4077 BC?" That alone resulted in nine additional chapters. And then there were minor questions on items I had never paid much attention to, like, "Why was Sirius red in antiquity?" and "What about the two latitudes of Babylon?" This last has been under discussion by astronomers since AD 100. But the solution is simple.

Mesoamerica

And then, as noted directly below, I started to look at Mesoamerica, which resulted in seven more chapters. So, after completing most of the narrative described in these pages in March of 2006, I came across the *Books of the Chilam Balam Of Chumayel* of the Yucatan Maya which were written shortly after the invasion by the Spanish. These were an attempt to secretly keep ancient myths and tales alive.

I was astounded to find among the texts a step-by-step rendition of the course of the "creation of the world" dating back to long before 3147 BC, followed by an accounting of other catastrophic events. The events are described in the same detail as the parallel Egyptian and Mesopotamian "legends." The *Chilam Balam* also provided dates which turned out to be congruent with what had already been extracted from sources in the Eastern Mediterranean by others. I started to include references to the *Chilam Balam* within the main text.

I followed up on ideas by Vincent H. Malmstrom, writing in *Cycles of the Sun, Mysteries of the Moon* (1997), and Anthony Aveni in *Skywatchers of Ancient Mexico* (1980), who both claim that the Mesoamerican ceremonial sites are aligned to the setting of the solstitial summer Sun. They are not.

I have much better data for longitude and latitude available today than Malmstrom and Aveni had, and found their conclusions to be completely wrong. What I found instead, unnoticed by Malmstrom and Aveni, were alignments to the setting of the zenithal Sun -- the day the sun exactly overpasses a particular site, 90 degrees up in the sky. It became clear that the location of every site in Mesoamerica was selected not only so that the Sun would pass directly overhead (which happens two days each year anyway), but sites were specifically selected to have the Sun set at a mountain or in a volcano on the western or northwestern horizon. The

mountains were selected to correspond to an alignment within 1/3 degree of this.

I thus looked closely at 13 early and well-established ceremonial sites in the Olmec region and the Valley of Mexico (plus two sites elsewhere), and found that they shared some 70 alignments to mountains or volcanoes -- each for sunsets primarily on six calendar dates only. These are, in fact, the calendar dates associated with the four major catastrophes identified for the Eastern Mediterranean.

After considering sources from the Eastern Mediterranean, I was able to tie the calendar dates to the catastrophic events of 2349 BC (September 8), 1492 BC (April 19), 747 BC (February 28), and 685 BC (three dates in June and July).

The dates turn out to represent the "flood of Noah" in 2349 BC (as the culmination of the Pleiades), the Earth shock of 1492 BC (recorded in Exodus), the shock of 747 BC (the start of the Babylonian "Era of Nabonassar" and the Roman calendar), plus a distribution of three dates which can be assigned to forty days of a solar nova event in June and July of 685 BC, corresponding to the Phaethon legend. [\[note 5\]](#)

What is interesting here is that the equivalent (seasonal) calendar dates which were found are likely to be very correct, even if the year these events are assigned to is not. To have all the multiple alignments of 13 sites consistently show up on 6 days only is well beyond random. Alignments for matching calendar dates vary only by a fraction of a degree between calculated and observed values from site to site. Among the 13 sites I looked at, there were 25 alignments assigned to the date of September 8th, 16 to April 19th, 10 to February 28th, and 22 to three dates in July. In all there were some 70 identical alignments used by 13 sites, plus 10 alignments for the setting Sun after an overhead (zenithal) passage.

Later chapters will deal with these Mesoamerican sources -- the Maya calendar, the ending of the "First Creation" in 8347 BC, the history of the world since the ending of the "Second Creation" of 3147 BC, the event known as the end of the "Third Creation" of 2349 BC, the cosmological crisis of 685 BC, the search for the "day of Kan," and an exposition of the *Popol Vuh*.

Within the text of the *Chilam Balam* I have identified the trees of the four directions, the place of reeds, the crossroads or rivers in the sky, the turtle first seen long ago, the three hearthstones in the sky, and a number of additional phenomena. Based on Olmec and later Maya iconography, I have managed to identify the plumed God with the crocodile body as well as the double-headed dragon with the Sun and Venus coming out of its two mouths, and the sloped-walled canyon for ballgames. This seems like the material of fantasies, but it is exactly what constitutes the religious symbols of Mesoamerica.

Who I Am

I should mention who I am, and what drove me to write this text.

First, I am a visual artist (sculpture, installations), living in Chicago where I have taught photography for years. But I also have a background in electrical engineering, cinematography, public administration, and programming, and a curiosity dating back a lifetime. More information is available at my website, [\[jnocook.net\]](http://jnocook.net).

Second, I researched and wrote this text mainly because a comprehensive narrative of events and a plausible physical explanation were lacking in the literature of catastrophism and alternative cosmologies. This is a void I have been attempting to fill over the last decade, initially for my own benefit. The text of the narrative is based on a carefully derived chronology and a celestial mechanics which has remained within accepted boundaries of physics.

Why This Text Is Presented on the Internet

This text is presented on the internet as webpages. The advantage of a web site is that it can be easily changed, added to, corrected, and expanded, while simultaneously having all of the ideas publicly available. The alternative of publishing this in printed book form would delay the availability, limit distribution to a select few, and allow no updates. And by going public I have been forced to complete the investigation and have been under pressure to make all of it coherent. Amazingly, additional details keep coming forward as the edits continue.

What Others Say

A few comments from readers, via infrequent emails.

- "A titanic job. It is mind blowing..." - A Suta
- "Absolutely fascinating and a masterpiece; when I came across your site my jaw slowly started dropping." -- R Houston
- "I was AMAZED. It is awesome." -- H George
- "Fantastic site ... sweeping in scope." -- EU forum fan
- "... a feeling ... of finally coming home." -- H Pluut
- "I am totally amazed and awed." -- M Signatur
- "If you are right then everything we know so far about human history is wrong." -- R Boerman
- "... reads like one of those can't-put-it-down pageturners." -- J Smith
- "The best and most complete i've seen." -- P Mitronikas
- "This is BIG stuff you're doing. ...feeling like I'm finally connecting to reality." -- N Rothstein
- "I love reading your website. I am actually reading it a second time. I think your chronology is brilliant." -- M Harris

- "I am not only enchanted but almost 'enthralled' by all this head-swimming learning...." -- D Sessoms
- "... far more interesting than the narrative that the historians or astronomers or geologists or priests tell us." -- K Widen
- "I started rereading your book this weekend and I could hardly put it down; your reconstruction makes so much sense." -- D Smith
- "Reading your Saturnian stuff ... awesome." -- E Boettger
- "I am overwhelmed by the scale and breadth of your ideas and writings." -- D Levie
- "... absolutely revolutionary." -- C George
- "Very impressive; your site is one of the more accessible rundowns for the layman of Saturnism." -- W Radtke
- "Love your site, I've read everything on it that I could." -- J Robillard
- "Found it quite profound ... a big part of what I am looking for." -- A Flanagan
- "Fantastic. You have pulled together so many things." -- J Brookes
- "My appreciation at the sterling work you have done." -- S Borruso
- "I admire your extensive and expansive research." -- H Postma
- "The scenario you have laid out answers many questions I have had for years and the way you present it is very comprehensible." -- D de Santis
- "This is truly an eye opener." -- J Dionne
- "For everything you want to know about Saturn and its myth, go to Jno Cook. This guy is twenty years ahead of everybody. ...take a peek regularly at this mind-blowing site." -- Dodeca at a forum
- "The best synthesis I have read." -- Sinner at a forum
- "A far cry better than some of the so-called 'legitimate' research out there. It is a shame more people cannot see what is staring them in the face." -- D Perkins
- "I love your site; your work is amazing." -- R Adams
- "I'm struck by the magnitude of your thinking." -- E Dawson
- "... probably the most comprehensive coverage ... pertaining to the history of Mankind." -- L Pronko
- "Well researched and painstaking work, well worthwhile reading" -- World Mysteries blog
- "A marriage of your art, and engineering, and your cut-to-the-chase writing style." -- P Thompson
- "... thoroughly enjoying returning to it periodically" -- A Mckay
- "... spellbound by finally uncovering some deep history mostly hidden from public view." -- A Fitts
- "... all of this has the force of a total paradigm shift. ... Suddenly most of the so-called mythological 'experts' -- such as Jo Campbell, M Eliade, I suppose Jung too -- seem rather laughable in many instances." -- J West
- "I used to consider the Velikovsky books to be the cornerstones of my library, but now I know better." -- T Hornbrook
- "You have my undying admiration for the monumental research you have done" -- J Buche

- "I'm starting on your book and am riveted!" -- J H
- "[The book] has completely taken over my imagination. It's the most fascinating and compelling thing I've ever read in my life." -- E Eckstein

Colophon

All the webpages are free of any requirement for specific fonts and font sizes (with one exception). So as a reader you ought to set your browser to some font type and font size that suits you for easy reading.

The exceptions are the tables, where a CSS script forces the use of Courier, so that the data of the tables will fall in-line correctly. No size is specified -- so set your monospaced font (Courier) to a size commensurate with the normal reading font you have selected.

I don't know what happens to typefaces and fonts when the HTML (PHP) files get converted to pdf. I'll sort that out later.

Image Credits

Endnotes

Note 1 --

The opening quotation ("A large planet ...") is lifted from a later chapter in this text.

The quotation by Cardona is from Alfred de Grazia's *Cosmic Heretics* (1983) as the content of a letter by Cardona to Earl Milton, who worked with de Grazia. I originally used a date for the Cardona quotation of 1982, since de Grazia's text covers up to 1983. De Grazia has no

endnotes to clear up his sources. In 2010 I changed the date of the Cardona quote to 1978, which is what de Grazia seems to suggest in his text. The concept of Saturn at the North Pole had been under public discussion for about five years at that time.

[\[return to text\]](#)

Note 2 --

"The emotional outburst from the community of astronomers that so blackened the name Velikovsky and so successfully, if only temporarily, discredited Worlds in Collision, has been laid to many causes, from the psychological and the political to simple resentment against invasion of the field by an outsider."

From Ralph E. Juergens "Reconciling Celestial Mechanics and Velikovskian Catastrophism" (*Pensee*, 1972). Two years later the American Association for the Advancement of Science (the AAAS) organized their famed symposium on Velikovsky.

[\[return to text\]](#)

Note 3 --

Alfred de Grazia, in *Cosmic Heretics* (1983), sources Shane Mage's book *Velikovsky and His Critics* (1978), with the following note: [abbreviations expanded]

"Shane Mage, in appraising the speeches against Velikovsky, uncovered in them several important concessions that had been apparently achieved over the years. First, the book Scientists Confront Velikovsky, 'disavows and repudiated the entire Scientific polemic of the 1950's and 60's both implicitly and explicitly.'"

"Next, both the sponsor, Goldsmith, and Mulholland assert that Velikovsky's ideas and arguments are not un- nor anti-scientific, whatever the press and then the scientific community presumed to draw from the event. Furthermore, the legitimacy of cosmic catastrophic hypotheses in science was acknowledged both by Sagan and Mulholland, but the specific hypotheses of Velikovsky were attacked (and obviously the scientists are in confusion as to how they can work historically and empirically with the hypotheses that they admit.)"

[\[return to text\]](#)

Note 4 --

Find Ralph Juergens's essay "Reconciling Celestial Mechanics and Velikovskian Catastrophism" at [\[saturniancosmology.org/juergens.htm\]](http://saturniancosmology.org/juergens.htm). This does one of the best jobs of introducing interplanetary plasma.

Much more important are two other essays by Juergens which apply plasma theories to conditions within the Solar System: "Of The Moon and Mars Part I - The Origins Of The

Lunar Sinuous Rilles" at [\[saturniancosmology.org/juergensa.htm\]](http://saturniancosmology.org/juergensa.htm) and "Of The Moon and Mars part II - Searching For The Scars Of Battle" at [\[saturniancosmology.org/juergensb.htm\]](http://saturniancosmology.org/juergensb.htm), both published in Pensee in 1974.

All discussions of planetary interactions presented at this website, "Recovering the Lost World," are extensions of the basic electrical concepts originated with these two papers. Once you figure out what they say, you will know everything there is to know about planet to planet interactions.

Other relevant articles deal mainly with the Sun, and are found at [\[kronos-press.com/juergens/index.htm\]](http://kronos-press.com/juergens/index.htm).

A recent discussion on plasma by James Hogan can be found at [\[saturniancosmology.org/jameshogan.htm\]](http://saturniancosmology.org/jameshogan.htm).

See also the following collection of websites:

- Wal Thornhill's website at [\[www.holoscience.com/\]](http://www.holoscience.com/).
- Don Scott's explanation of plasma theories at [\[www.electric-cosmos.org/indexOLD.htm\]](http://www.electric-cosmos.org/indexOLD.htm) and his book *The Electric Sky* (2006).
- The work of David Talbott (with Wallace Thornhill and others), including the book *Thunderbolts of the Gods* (2005), at [\[www.thunderbolts.info\]](http://www.thunderbolts.info). A second book by the same authors, *The Electric Universe* (2007), is more specific and does a much better job of presenting galactic, solar, and planetary plasma.
- The "Thunderbolts" site (above) includes an amazing series of daily images and comments, mostly dealing with outer space, but at times including some mythological themes. A brief rundown of Talbott's "Saturn Theory" is included among essays. There is also a forum with discussion ranging from the well-informed to the inane and mostly concerned with contemporary astronomy from the standpoint of interstellar plasma.

Specific to plasma theory are the following:

- The website of the astronomer Halton Arp at [\[www.haltonarp.com/\]](http://www.haltonarp.com/).
- Material by Anthony Peratt of Experimental Programs at Los Alamos National Laboratory. Find it at [\[plasmauniverse.info\]](http://plasmauniverse.info).

Peratt is one of the world's leading pioneers in plasma physics and plasma cosmology. Peratt's papers on the petroglyphs and the south polar plasma column are located at the site above, but hard to ferret out:

Look under NearEarth.html for "A. L. Peratt, *Characteristics for the Occurrence of a High-Current, Z-Pinch Aurora as Recorded in Antiquity*" and "A.L. Peratt, J. McGovern, A.H. Qöyawayma, M.A. Van der Sluijs, and M.G. Peratt, *Characteristics for the Occurrence of a High-Current, Z-Pinch Aurora as Recorded in Antiquity, Part II:*

Directionality and Source."

- An extensive collection on plasma theory, developed and maintained as a Wiki site by Ian Tresman of SIS, at [\[www.plasma-universe.com\]](http://www.plasma-universe.com).
- The most readable synopsis of the elements of plasma theory is the website, [\[www.plasmacosmology.net\]](http://www.plasmacosmology.net) -- a very extensive site, written in a summary, easy-to-read style. The descriptions include some catastrophism and mythology.
- Another website equal in scope and general interest is [\[www.plasmaresources.com\]](http://www.plasmaresources.com) -- run by David Smith, AU.
- A very readable overview which generally cuts across the handed-down "science" to zero in on essentials: [\[sites.google.com/site/cosmologyquest/default\]](http://sites.google.com/site/cosmologyquest/default) by Michael Suede.

There are more links relevant to prior research in the next chapter, and in the Appendix "List of Links." See also the Appendix "List of Books." Plasma is a controversial subject with Wikipedia, since it may be enlisted to present evidence against the Big Bang theory. Wikipedia articles dealing with plasma and related topics are therefore often edited in favor of handed-down science. The reader should be aware of this bias. As an antidote I recommend two books: Eric Lerner, *The Big Bang Never Happened* (1991), and Hilton Ratcliffe, *The Virtue of Heresy: Confessions of a Dissident Astronomer* (2007).
[\[return to text\]](#)

Note 5 --

The culmination of a star (the Pleiades mentioned in the text) is the date when it reaches the highest point in the sky. This would always be directly south, and at midnight. The Pleiades culminated on the third night after the fall equinox in 2349 BC, which occurred 15 days earlier before 685 BC. Precession of the equinox does not apply to the era before 747 BC. The concept of the "third night" (actually two days and a night) is of importance in later religions. All the calendar dates are "Gregorian equivalent" dates, apportioned over the real-time calendar days for shorter years. These conditions will be detailed in later chapters.

Recovering the Lost World, A Saturnian Cosmology -- Jno Cook

Chapter 2: A Synopsis.

\$Revision: 42.71 \$ (syn.php)

Contents of this chapter: [\[Missing Evidence\]](#) [\[Historical Synopsis\]](#) [\[New Findings\]](#)
[\[Contents and Resources\]](#) [\[Endnotes\]](#)

Missing Evidence

Before launching into a lengthy history, let me offer in brief form ("a synopsis") the story of what I have found, both in confirmation of the research of others and filling in what they have missed. But first, some caveats and opinions. In the next chapter I'll describe the research of David Talbott and the contribution by Wal Thornhill which have led to the theory of the polar location of Saturn.

Before you become flush with indignation at the preposterous claims I will be making in the following paragraphs, consider that I cannot offer the evidence at the same time as the capsule descriptions. Your indulgence is therefore requested. The evidence follows immediately in a terse presentation of some 700,000 words (readable as one chapter a night for a month). Only two jumps are made in the sequence of logical connectivity: an overall base chronology is developed in Appendix A, and most of the detailed plans of celestial interactions are found in Appendix B. That leaves, as the main course, a narrative of the historical events, often separated by many hundreds of years, but more or less in historical order. I hope this will sooth your temper.

You might also take stock of the fact that what is presented here has close parallels in the work of a half dozen other writers, all engaged in emphasizing the catastrophic prehistory of Earth, each of which lays claim to being solely correct (as I do also). I am not including fringe authors like Zecharia Sitchin, Eric von Daniken, Victor Clube and Bill Napier, or 2012 prophets, pyramidiots, and UFO buffs, all of which have gone over the edge. [\[note 1\]](#)

Nor am I at all given to causes attributed to comets and meteors crashing into Earth, especially after looking closely at the Tunguska event of 1908, and the claim of bolides over North America in 10,900 BC as presented by Richard Firestone's group. Electric field interactions can explain all of the unexplainable much easier and more predictably. [\[note 2\]](#)

If I still have your attention at this point, let me rouse your ire once more by proposing that, for example, the Chicxulub crater in the Yucatan is not the mark of the largest bolide ever intercepted by Earth, as is commonly thought. Rather, it is the result of a lightning bolt 110 miles (177 km) in diameter, and not the crater of an object falling from the sky. Yes, lightning bolts can travel millions of miles between planets. Yes, we lost the dinosaurs over the next 10 million years, but the large-scale extinction does not at all conform to the consequences of a fallen rock, as is certainly recognized by the establishment. More on this in a later chapter.

Historical Synopsis

The chapters of this site will propose that the biology of our planet, our culture, our psychology, and our very existence, are the result of a series of incidents arising from the interaction between Earth and other planets within the Solar System, most notably Saturn.

The biology of Earth is such a complete accident and so utterly unlikely that it will not have ever been duplicated anywhere, at any time, among the billions of other star systems. But here on Earth, all of it, especially the rise of complex species since the Cambrian Period, 560 million years ago, can be attributed to a series of cataclysmic plasma strikes by Saturn, each of a very long duration: biologists claim 10,000 years for the extinction events; my original estimate was 15,000 years. [\[note 3\]](#)

As hominids, we survived the last externally induced extinction event which gave rise to eight competing sub-species over the course of the last three million years. Our only contribution to our distinction from other animals was the invention 10,000 years ago of language and its subsequent cultural transmission. That set the stage for further development of our "humanity," much later on and much closer to our time: *subjective consciousness*.

It all started very long ago. At one time, and from its genesis, Earth was a planet in orbit around Saturn, a brown dwarf star. Toward the end of the Precambrian (600 million years ago), the Saturnian System intersected with the Solar System. Saturn swept around the Sun, and back into deep space, to return at regular 26- to 27-million-year intervals. Over the course of time, some of the satellites (planets) of Saturn were wrenched from their orbits around Saturn to end up revolving around the Sun instead. The Earth likely became a Solar System planet at the end of the Permian, 250 million years ago.

From 600 million years ago Saturn kept entering the Solar System regularly to disturb its lost satellites now circling the Sun. At about 3 million years ago Saturn likely had a run-in with Jupiter, a Solar System planet at that time orbiting the Sun at a distance probably somewhat less than the Earth's orbit today. The orbital period of Saturn was significantly reduced as a result.

During this last 3-million-year period Saturn started scavenging its lost satellites, and perhaps Solar System planets, all in orbits close to the Sun. The possibility of a "captured" planet

again orbiting Saturn at its equator is virtually nil. Instead, the scavenged planets ended up in suprapolar and subpolar locations, the only locations which seemed to be dynamically stable.

Because Saturn had come in from outside of the Solar System, and most likely was a star originally, it would have been at a very high positive charge level -- distinct from the Solar System planets. Solar System planets would have been attracted to Saturn when Saturn entered the Solar System -- rather than be repelled as would be the case of two planets with nearly equal values of charge.

Saturn, with its stack of captured planets, was seen by hominids (*Homo erectus*) and recorded in the shapes of artifacts in the Paleolithic of about two million years ago, and by humans (*Homo Sapiens*) as carved images in the Upper Paleolithic, from 30,000 BC, and by the hundreds of millions during the early Neolithic, 10,000 to 3000 BC, when the stack of planets was much more frequently seen.

At about 10,900 BC, the Earth (at that time a planet of the Sun) made an electric field contact with Saturn, causing 1500 years of "darkness" (shadow) on Earth. The period of darkness is recognized by many of the world's creation myths, and was recorded in the illustrated graphic books of Mesoamerica, references to which are made in Colonial-period documents. Climatologically the period is identified today as the Younger Dryas, when for some 1500 years Earth got as cold as it had ever been.

Over the next 7000 years the orbit of Earth, apparently equal to the orbit of Saturn at that time, but below Saturn, progressively moved laterally to have the Earth's orbital path eventually travel below the center of Saturn. Thus, between 10,900 BC and 3147 BC, Earth was part of a strange configuration of stacked planets, a condition which provided long summers and a mild climate in the northern hemisphere. Planets, dominated by the giant form of Saturn, stood above the north horizon and close to Earth (but measured in millions of miles) and were taken by humans to be the Gods who supported them and for whose benefit they labored at agriculture and conducted trade.

Initially, during a 1500-year period after 10,900 BC, when the cold of the Younger Dryas set in, and long before Saturn was clearly seen, three fiercely lighted ball plasmoids were seen far south of Earth, below the South Pole. Between about 10,900 BC and 8347 BC, these connected to Saturn in the north via strands of brilliant arcs of electrons. Forms of various shapes ran south over these electron lines, traveling toward the three plasmoids. The moving shapes were taken to be dead animals and dead humans.

The objects in the south sky became the basis for all of the original religions (and a good deal of mythology) throughout the world, for they persisted in showing nightly and seasonally over the course of 2500 years (to 8347 BC), although only for three periods of hundreds of years. For the people of Mesoamerica the year 8347 BC, when the last of the plasmoids extinguished after 2500 years, was the end of their first tally of years which accounted for the "first creation."

We know only a little about these ball plasmoids from obscure mythological references. And we would still not know very much, if it had not been for an investigation undertaken by a team led by Anthony Peratt (of Los Alamos National Labs) of some 4,000,000 petroglyphs worldwide, carved high up on mountain sides, facing in all directions but always with a clear view toward the south. That study, published in the journal *IEEE Transactions on Plasma Science* in 2003, was an absolutely astounding revelation. More on that in a later chapter.

In 4077 BC Saturn dropped its coma. This had been the "chaos before creation" which had lasted some 7000 years. It had obscured Saturn and its companion satellites. Saturn went nova, it switched to arc mode. In a mass expulsion Saturn produced its rings and a new satellite, Venus (and perhaps another), and Saturn lit up more brilliantly than the Sun. To the humans of Earth, who had not clearly seen the real Sun for thousands of years because of the shadow of the Younger Dryas followed by the obscurity of the enclosing plasmasphere of Saturn, this was the start of creation, the start of time, and the first showing of "the land" and its resident Gods, the satellites of Saturn. Saturn was universally called "the sun" throughout the world.

In Central America the *Popol Vuh*, written circa AD 1600 from much older records, recounts:

"Like a man was the sun when it showed itself. It showed itself when it was born and remained fixed in the sky like a mirror. Certainly it was not the same sun which we see, it is said in their old tales."

In arc mode Saturn would have lost its glow mode coma, but it apparently retained a plasma stream connection to Earth. The Sun (the real Sun) lighted part of the edge of Saturn in a crescent which revolved around Saturn on a daily basis, visually caused by the daily rotation of Earth below Saturn.

This stack of planets consisted, from top to bottom, of Uranus (on its side as today) and Neptune, both hidden by Saturn below them (known in Mesoamerica from earlier times). I suspect that these three planets had been seen together for perhaps 2,000,000 years -- initially by *Homo erectus*. Below Saturn the following were located from top to bottom: Mercury (joined the group in about 14,000 BC), Mars (resident probably since at least 30,000 BC or earlier), and Earth (joined the group after 10,900 BC).

In 3147 BC this configuration of standing planets broke apart, with the three large planets moving far away from the Sun, and Earth and Venus released to overlapping "inner" orbits. The breakup produced a stupendous flood of the waters which had been held at the south polar region due to the gravitational attraction of Saturn for some 7000 years. The water held at the South Pole was due to the lifting up of the Earth's crust in the Arctic, and the sinking toward the Earth's interior in Antarctica.

Flood stories are ubiquitous, found in over 500 independent "myths" -- all with the same coherent details. The survivors included people far inland, those living already on mountain

slopes, and apparently the people of the Nile delta and Northern Mesopotamia. The only recourse to a livelihood for many of the survivors was agriculture, which soon sprang up (simultaneously) in six unconnected regions of Earth.

The breakup was caused by Jupiter, which had circled the Sun as an inner planet up to that time. Jupiter was subsequently seen receding in the skies, surrounded by a coma visually three times larger than the diameter of the Moon today. Below the south pole of Jupiter extended a gigantic plasma outpouring, making it look like Jupiter was resting on a mountain (it was green initially). Above the planet were much smaller horn-like extensions. The whole of this looked like a person in a mantle, but was also identified as "the Bull of Heaven." Jupiter was taken as the new God, called "the younger." Jupiter retained its massive lower outpouring until it entered the asteroid belt in about 2860 BC, after which the coma reduced in size and changed its shape.

After 3070 BC Mars and Mercury, which had remained in their positions below Saturn, were released when Saturn entered the asteroid belt. The two planets crossed Earth's orbit for about 300 years, overriding the Earth's orbit close to Earth on 30-year (or 15-year) average intervals. At those times Mars was at times brought into plasma contact with Earth, looking like a squat mountain which circled the Earth -- the visual effect of the rotation of the Earth. With Saturn and Jupiter both disappearing into the ecliptic, Mars was held to be the God in charge of Earth, Horus of the Egyptians.

This lasted to about 2750 BC or 2700 BC, after which the regular visits of Mars ended, its elliptical orbit perhaps rotating away from Earth (an apsidal precession). In the next century people throughout the world start building pyramids in imitation of the disappeared mountain of Mars, all within a hundred years of each other -- in Egypt, Mesopotamia, England, China, in the Andes of South America, and in many other locations, such as Greece and the Balkans (as has been discovered in recent years, although not validated).

We have recorded histories of these celestial events, especially in Mesoamerica. There are accurate descriptions of the rings and the number of satellites of Saturn, the cloud bands and satellites of Jupiter, and the scarred surface and satellites of Mars, all dating from antiquity and spanning cultures worldwide. The Egyptians produced schematic images of the original configuration of Saturn and the satellite planets below, and have a record of early close passes by Mars. Mesopotamians also produced images of planets, graphically showing, for example, all the satellites of Jupiter. The Maya (from Olmec sources) have an undated record of the planetary movements from long before 3147 BC, and a dated record of later events which matches what can be gleaned from Eastern Mediterranean sources. The Aztecs produced graphic images of these planets, although anthropomorphized to gods and produced very late. South Sea islanders have similar records of the rings of Saturn. India has similar recollections of these events extending over millions of lines of poetry. The Quiche Maya *Popol Vuh* and pages of the *Maya Books of the Chilam Balam* makes casual references to the period of 13,000 years ago (probably 10,900 BC). One page of the *Chilam Balam* records seven appearances of the Saturnian planets as far back as perhaps 40,000 years (which can be

collated with atmospheric Carbon-14 records dating from 50,000 bp).

Over the next 2500 years (3147 BC to 685 BC) the inner planets interfered with Earth at intervals, although very infrequently. There were four major additional incidents. The damage often was localized in latitude, although, for example, a continuous lightning strike might have encircled the globe in circa 1492 BC and certainly repeatedly in the 8th and 7th century BC.

As recalled by nearly all peoples on all the continents, the most terrifying incident, however, happened in 2349 BC when an alignment with Venus (20,000,000 miles away at that time -- 32,200,000 km) produced an Earth shock in the northern hemisphere, tilting the Earth's axis away from the Sun temporarily, and tilting up the equatorial rings of the Earth (Earth at one time had equatorial rings). This was followed perhaps six hours later by the arrival of a massive disconnected plasmoid lightning bolt from Venus which hit the rings almost broadside, followed somewhat later by lesser bolts, recorded in Mesoamerica and China.

[\[note 4\]](#)

The electric contact with Venus turned the equatorial rings blood red and caused the destruction of the rings. Lightning bolts arced up to the rings from the Earth's ionosphere layers and the lower equatorial plasma toroid (the Van Allen belt). The sky bled for three days, and only a single ring remained. Dust continued to rain down for the next 4000 years (until AD 1600). The cleared southern skies, previously obscured by the Earth's rings, revealed a multitude of stars for the first time, most notably the Pleiades, located directly south at midnight two nights after the equinox.

The equatorial plasma toroid would have also arced to the surface of Earth, producing months of torrential rains. To humanity, the "sea" of the Earth's equatorial rings in the south sky (the Absu) had collapsed to Earth, and the event was almost everywhere understood as a second flood of stupendous proportion. The Bible recalls this event as the flood of Noah. But to most peoples the blood seen in the sky suggested the wholesale slaughter of humanity, and any number of raging goddesses or dragons were assigned to this event in mythology worldwide -- Kali, Tiamat, Anath, Sekhmet, Hathor, and much later, Beowulf's Grendel.

After two and a half days, Jupiter appeared again with its previous giant coma and lower mantle (again understood as a mountain), as if risen from the dead. In fact, the rise of the equatorial (in the sky) made it look as if Jupiter rose up out of the cave previously seen as the shadow of Earth on the rings. The cave-shaped shadow opened up as the Earth regained its normal inclination, and Jupiter rose out of this to a location above it.

Jupiter had stopped the dragon from killing additional humans. The event itself remains commemorated as the "Day of the Dead," and is almost universally associated with the culmination of the Pleiades in autumn. Echoes of the fall of the rings and the surrounding circumstances continue to resound in mythology and, to this day, in the theologies and practices of many religions -- especially the resurrection of Jupiter on the third day. Many

nations also date the start of all sensible history (and their calendars) from this event. Strangely, this event is simply not noted by any of the catastrophists. Even Velikovsky remained unaware of it.

Eight hundred years later, in 1492 BC, Venus again made an electric contact with Earth, causing a crushing repulsive blow in the east Central Pacific. The Pacific islands were wiped clean of any trace of humans, except for the petroglyphs carved on every island thousands of years earlier. Coastal South America and Central America were inundated with water, leaving sea-water traces in lakes high up in the Andes, and possibly causing a sudden rise in the coastal range of the Andes by thousands of feet. The blow was followed by an electric arc traveling through the Pacific, the Indian Ocean, and part of India -- following a path of increasingly higher latitude into the Mediterranean as the Earth's axis angled back toward the Sun. Moses made his escape from Egypt during the turmoil. The event is recalled in mythology as the attack of the monster Typhon who is struck down by Zeus. The major result of the contact was a 30 percent increase in the orbit of the Earth -- the year went from 273 days to 360 days. Venus probably came no closer than 10,000,000 miles (16,000,000 km) in this instance.

Something else was initiated at this time. The movement of tribes away from devastated areas and failing climates into new regions happened after 1492 BC. Tribes of Central Asia entered India, Anatolia, and Greece. Tribes from Asia Minor settled in Italy (as well as at later dates also). People everywhere met strangers, and had to cope with new living conditions. This resulted in an expansion of our imagination as a way of coping with these changes -- the development of *subjective consciousness*. Before this time there was little need to deal with change. The people of Egypt and Mesopotamia (for whom we have records) had remained stagnant in the way of life of their forebears for thousands upon thousands of years. The development of *subjective consciousness* (as opposed to mere consciousness) was a cultural innovation and the major change which made us human. Subjective consciousness came to be taught to children by parents, exactly like language is taught. The teaching of subjective consciousness (like the teaching of language) can be readily observed today.

[\[note 5\]](#)

Another 700 years later (806 BC to 687 BC) Mars closed in on Earth with repeated electric arc contacts at 15-year intervals, a major Earth shock in 747 BC, and a minor shock in 686 BC (this last caused by Mercury). Earlier, Mars had also interfered with Earth in similar fashion at the close of the Early Bronze Age, 1935 BC to circa 1700 BC, which includes the destruction of Sodom and Gomorrah.

Mars came close, perhaps to within 40,000 miles (64,000 km) of Earth. The interactions, as a result, were completely different from the long distance shocks due to Venus. The destructions of the 8th and 7th century BC were spread over long stretches from Central Asia to the Western Mediterranean, and through to Mexico and Southern United States. From the Persian plateau to Greece, in swaths measuring more than 600 miles (966 km) wide, hilltop citadels were destroyed by quake-like convulsions much more extensive than any earthquake,

and by massive lightning strikes.

Cities and citadels were buried under yards of carbonized material mixed with soil. The soil and burned forests were dropped whenever the traveling lightning bolt paused at a hilltop. These simultaneous destructions have been noted in the archaeological record, and include the events of the 8th and 7th century as well as after 1935 BC.

De Grazia estimates that only 2.5 percent of the original population of 200 million of the Mediterranean region survived. Bolsena (Volsinii), a city in Italy, was obliterated by a lightning bolt measuring more than 5 miles (8 km) in diameter -- if we are to believe Pliny, who presents this from older Etruscan sources.

The circular lake at Bolsena is larger than any volcanic caldera. Mars became the next sky God and set a tone for human conduct -- lasting to this day.

[Image: Bolsena, Italy; after Wikimedia.com.]

The destructions of the 8th and 7th century BC obliterated the coastal areas of Greece and coastal Anatolia. The remnant population turned to raiding and became the pirates celebrated in the Iliad and as the Egyptian "People of the Sea." The Iliad reveals that these were no sailors. Warfare and the extraction of tribute also became a way of life for the Assyrians, who plundered from Elam to Egypt.

The change in humanity, however, which suddenly brought people up to our current expectations, was an event which happened early in the seventh century BC. In 685 BC Venus and Mercury blazed as bright as the Sun and were seen in the daytime skies with the Sun for forty days starting on June 15. The event was probably an extraordinary plasma outpouring by the Sun, brought on by the sudden relocation of Mercury to within the orbit of Venus in the previous year.

In July of 685 BC (actually the astronomical year -685, corrected from 680 BC Julian in Eastern Mediterranean chronology), Jupiter also erupted with a coma in response to the Sun's increased output of plasma, and on July 14 sent a return lightning stroke, a plasmoid bolt, headed for the Sun. It arrived at the Sun on July 25th. The plasmoid, which passed by Earth

at a distance of 30,000,000 miles (48,000,000 km), was seen in foreshortened form by Asia and Europe, and is depicted in sculptures and illustrations and even on coins. The Mediterranean nations thought that Venus (or Mercury) was struck -- the bolt from Zeus which toppled Phaethon from the Sun's chariot.

Mesoamerica saw the plasmoid at full length as it passed by in the daytime, and depicted it correspondingly differently. Their understanding was that Mars was struck. It was called "the bundle of flame" among the Maya. To China this was the celestial dragon, the traditional form of which matches the structure of a plasmoid lightning bolt. [\[note 6\]](#)

[Image: Dorji, model plasmoid; after Taramandala.org.]

As experienced by Earth, the after-effect of the 40 days of extreme solar activity was the relocation of the polar axis from Ursa Major to near Ursa Minor, and the delay of spring by some 15 days (in effect changing the inclination of the polar axis which is equivalent to rotating the dome of the stars). A new equinox was suddenly established. The aphelion of the Earth's orbit (the location furthest from the Sun) changed, and 120 years of interference by Mars and Mercury came to a sudden halt. It appeared to many that Jupiter, the historical supreme God of antiquity, had again saved mankind from destruction. The change in aphelion had resulted in a cessation of further interactions with Mars. In 670 BC the Earth's orbit became nearly circular (for unknown reasons), and the Earth was in fact completely removed from any future interference by any of the inner planets.

Within 100 years of this event, we see the simultaneous rise of philosophical studies, much as we understand them today, in China, India, Mesopotamia, Anatolia, North Africa, and Rome -- well before there was any cultural transmission between the more distant regions in this list. It had appeared to many as if a far greater power, beyond the dome of the stars, had moved the stars and planets and restarted the Universe. For many of the philosophers, the causes for natural phenomena were now sought elsewhere than in the whims of the old planetary gods.

With the realization of the existence of a power beyond the planets and stars, we also see the sudden rise of all the modern religions within the span of 100 years -- Taoism and Confucianism in China, Jainism, and Buddhism in India (with its subsequent influence on Hinduism), and Zoroastrianism (Mazdaism) in Persia with its influence on Judaism,

Mithraism, Christianity, and eventually on Islam. Similar changes seem to be attested to in Mesoamerica, probably dating from after 600 BC.

Could all this really have happened? Religions have attempted to explain all of it, initially as narrations of the observed events, eventually as metaphors of spiritual states. Science, on the other hand, has spent the last two hundred years denying that anything at all ever happened. But a look at the histories (what we call myths) of people from regions as diverse as China, Mesopotamia, and Mesoamerica will reveal that they are in complete agreement with each other. Add to these the various myths of the people of India, South America, Africa, Greece, and thousands of others, and a consistent picture of the past emerges, which is not what science tells us.

Or fly over the regions of, for example, the Western United States, and you will soon be convinced that the waves of hills, the conical dumps of windborne soil, the distorted folded mountains, and the widely varied landscape cannot possibly be the result of eons of slow movement and metamorphosis of the Earth's crust. The surface of Earth appears to have been battered and wracked convulsively, and recently.

Except for geology, which I will not really touch on, the remaining chapters will fill in the details and broaden the scope of the four major events. The four events are:

- The end of the "Age of the Gods" and the worldwide flood in 3147 BC;
- the fall of the Absu (known as the "flood of Noah"), the blood in the sky, the resurrection of Jupiter, and the first appearance of the Pleiades in 2349 BC;
- the defeat of Typhon and the Exodus of Moses from Egypt in 1492 BC; and
- the blazing of Venus and Mercury and the thunderbolt of Jupiter which toppled Phaethon in 685 BC.

The last few chapters present an excursion into the site plans and iconography of Mesoamerica from about 2000 BC. In these last chapters you will find that the more closely detailed findings from Mesoamerica will match and often exceed the information available from the Eastern Mediterranean.

Highlights of New Findings

I checked and verified many theories which had been proposed by others about the past. Below I have listed new findings which came out of the attempt to establish a chronology and develop a rational set of mechanics for planetary interactions. Many of these findings have remained unknown (or obscured) to other investigators. Other items listed below are well established, but tend to be avoided or negated by researchers of the catastrophic past.

I am offering this list for those readers who are familiar with the major elements of the catastrophic literature of Immanuel Velikovsky and David Talbott. If this is all new to you,

skip the rest of this page and proceed to the next chapter.

- The Earth never turned over -- at least not completely and certainly not permanently. This had been suggested by Velikovsky and others, but is a nearly impossible notion. I dispute this and discuss the origins of these ideas in the Appendix "Polar Relocations Disputed."
- The age of the Earth, Mars, and the Moon are exactly what they seem to be from the most abundant earliest rocks. The ages do not need to be expanded to fit a theory of the single creation of the whole Solar System, as popular science has done. Details in Appendix A.
- Saturn probably first entered the Solar System 600 million years ago, before the Cambrian Explosion. The sudden development of new phyla and species could be attributed to a nova event (and a mass expulsion) of Saturn at that time.
- All the mass extinctions, and the speciation events which follow these, can be attributed to plasma discharges of Saturn as its orbit repeatedly, and at regular intervals, brought Saturn to an intersection with the Solar System. The excursion through the Solar System would extend over about 15,000 years. This is discussed in the chapter "Nevada Conference."
- The Permian extinction, 250 million years ago, is the second to last nova event of Saturn, and occurred at a time when Earth was still on an equatorial orbit about Saturn. It did little to advance life on Earth, taking it backward by a hundred million years. But Earth became a Solar System planet after the end of the Permian. The plant forms of Earth testify to the two distinct environments.
- The glaciation dated 30 million years ago and the intermittent glaciation since 3 million years ago (which can be blamed on electric plasma contacts by Saturn) follow the 27-million year repeating pattern. The rise of hominids in the last three million years is discussed in the chapter "Ice Ages and Humans."
- The last intermittent glaciations might testify to a series of recent interactions between Earth and Saturn.
- The mention in many creation myths of a period of darkness preceding creation can be dated to the early Neolithic or late Upper Paleolithic and is likely the result of nanometer dust particles in the stratosphere after a massive compressive force and lightning strikes by Saturn in North America in 10,900 BC. This caused the worldwide period of extreme cold, drought, and darkness, recognized today as the Younger Dryas period. For more on this see the chapters "Tunguska and Chicxulub" and "The Younger Dryas," with additional Mesoamerican retellings in the chapters "The Chilam Balam" and "The Popol Vuh." The cataclysm is addressed in papers by Richard Firestone, et alii, in 2001 (*Mammoth Trumpet Magazine*), and in 2007 (*Proceedings of the National Academy of Sciences*).
- The clouded swirling skies which are found at the start of most creation myths are the result of Earth falling into a subpolar orbit with Saturn and entering the lower part of the coma of Saturn. See the chapter "The Event of the Younger Dryas" for a narrative and a consideration of the dynamics. This also coincided with the start of the Hypsithermal

period in 9500 BC (for which see the chapter "A Timeline and Gimbutas").

- While traveling through the lower plasma formation of Saturn's coma, the Earth three times experienced the formation of three ball plasmoids 150,000 to 400,000 miles (240,000 to 644,000 km) below the South Pole, with lines of electrons connecting these and running past Earth to an object in the north skies. This started in 10,900 BC, and ended in 8347 BC. The petroglyphs of this condition were investigated by the team led by Anthony Peratt, and published in 2003 and 2007 in the *IEEE Transactions on Plasma Science*. The dates above are from my findings.
- The ubiquitous female figurines found in the millions on millions worldwide, dating from the Upper Paleolithic and the Neolithic, are representations of Uranus, Neptune, Saturn, Mercury, and Mars as seen together in the skies on the ecliptic, enclosed in a coma. Discussed in the chapter "A Timeline and Gimbutas."
- The flood of 3147 BC is correctly identified in the mythology of Sumerian and Bible sources, although shifted to a narrative of 2349 BC. It can be assumed that Jupiter (at that time closer to the Sun) passed Saturn and its planets on the inside of Saturn's orbit. The current orbital inclinations of the outer planets matches the expected vertical separations of the planets in 3147 BC. Discussed in Appendix B.
- The flood of 3147 BC, which was the world flood, came from the south, as a result of the relaxation of the Earth's crust when Saturn left its location above the Earth. This resulted, among other things, in the debris of the Siwalik hills in northern India, as well as the tropical- and temperate-climate plant and animal remains found in the muck of the North Polar sea.
- The Palette of Narmer depicts Venus, Mars, and Uranus, where the pharaoh figure is Horus/Mars (and dressed as Saturn) -- not some battle of unification for prehistoric Egypt, and with Mercury as the sandal bearer of the pharaoh. See the Appendix "The Palette of Narmer."
- The bee and the sedge, as in "He of the Bee and the Sedge," is the pharaoh as Saturn, with Venus as the bee and Uranus as the sedge. See the chapters "The Creation," and "The Start of Time."
- The raven and dove let out by Noah to test the waters can be identified as the planets Uranus and Venus as seen from Earth directly after 3147 BC. The Mesopotamian flood myths identify the same planets and adds a Swallow -- which is likely the Moon but might be the later Mercury.
- The report in the Bible and in Mesopotamian legends (and hundreds of additional flood legends) of a ship landing on a mountain after the flood is the backlighted crescent of Jupiter on top of a massive outpouring of plasma from the south pole of Jupiter. In Egypt, as in some Mesopotamian retellings of this event, this is also understood as an approaching celestial bull, which destroyed the city of the Gods.
- The orbits of the inner planets have changed only minimally since 3147 BC. Most changes involve an apsidal rotation of the second nodal point. Planets have to line up exactly with the Sun to result in an electric field interaction of their plasmaspheres.
- The biannual sightings of Mars passing close to Earth between 3070 BC and 2750 BC are recorded as events in the dynastic records of the Palermo Stone of Egypt.

- The few interactions with Venus (which have been presented as "collisions" by others) occurred at distances of 10 to 12 million miles (16 to 19 million km) and 17 to 20 million miles (27 to 32 million km). Electric interactions with Mars occurred at much closer distances as Mars slipped by Earth, but probably no closer than 40,000 miles (64,000 km). Details in various chapters and Appendix B.
- The orbit of Earth enlarged four times since 3147 BC: in 2349 BC, 2193 BC, 1492 BC, and 747 BC. See Appendix B, "Celestial Mechanics." Each time the Earth reached a different location from the Sun, it needed to adjust its charge level, and plumes of plasma extended up from the magnetic poles, perhaps lasting for years.
- Both the north and the south plumes, extending up some 10 or 20 Earth diameters, were seen throughout the world. The ends moved with the rotation of the magnetosphere, making them look like they were waving in a wind. The people of Mesoamerica called them trees, with birds sitting on top. Egypt called them braziers releasing plumes of smoke and Mesopotamia called the east and west plumes flags or banners and recorded them in seals and sculptures. Mesoamerica in two instances provides a count of how many times this happened. The plumes were detected by NASA in dark mode plasma in 2009, a year after I had added them to my text.
- When Jupiter entered the asteroid belt, the mountain form of the lower plasma disappeared. Instead, the plasma from Jupiter's south pole extended directly left and right to the asteroids and curved up further away (Jupiter has a reversed magnetic field). These are the ram horns of Amun-Ra. The form is called the "shen" in Egypt -- a circle on a flat line -- and is depicted as a boat almost everywhere in antiquity. See the chapter "The Career of Jupiter" in chapter 20.
- Jupiter's coma tripled in size in about 2527 BC as it left the asteroid belt, but lost its coma again by 2438 BC. The coma returned in 2349 BC (the "flood of Noah"), but eventually reduced to the visual size of the Moon. In 2150 BC Jupiter caught on fire and burned up a substantial amount of its atmosphere. When this extinguished, Jupiter reduced in size to that of a star.
- The Earth had equatorial rings until 2349 BC (like all other planets with a magnetic field), called the "Absu" in Sumer and the "Duat" in Egypt (and the "House of Nine Bushes" in Mesoamerica). The Egyptian "doorway to the other world" is the shadow of Earth cast on the equatorial rings, the Duat. This is discussed in a number of places, first in the chapter "The Absu and Speculation" and in more detail in later chapters. The "flood of Noah" consisted of the sudden removal of the equatorial rings, and was accompanied by severe storms and rains.
- The Earth was moved to near the Moon in 2349 BC, when the Earth's orbit increased, but the Moon did not fall into a regular orbit shared with Earth until perhaps about 2280 BC. The legendary emperors (gods) of China, Yao and Shun, are Jupiter and the Moon. Likewise for Abraham and Isaac. These two were depicted in Mesopotamia also, on the victory stele of Naram-Sin, the great grandson of Sargon, showing Jupiter with his mountain.
- The Bible identifies the blazing of Jupiter as the first "Tower of Babel" event. The date is most likely 2150 BC. There was a similar event involving Mercury, much later and

thus better remembered, in 686 BC. This last bursting into flame was remembered worldwide, and was also identified with the "Tower of Babel" event -- remembered in the Americas too.

- The Olmec Long Count calendar was instituted on February 28, 747 BC (astronomical year -747). This is also the first full day of the Babylonian "Era of Nabonassar," and the day before the start of the new Roman calendar. The Olmecs added 2400 Tuns (years of 360 days) to account for the past history in solar years, resulting in a Long Count notation starting at 6.0.0.0.0. This is discussed in the chapter "The Maya Calendar."
- As a result of instituting the Long Count in 747 BC, the Maya/Olmec creation date of 3147 BC is accurate as the date for the terminal event of the polar alignment of Saturn -- in solar years. Our use of the date of 3114 BC is based on a year of 365.24 days. Later retrocalculations by the Maya used a year of 365.24 days.
- The Venus Tablets of Ammizaduga are correctly dated to the period of 689 BC to 667 BC (in Eastern Mediterranean chronology). See the chapters "The Tablets of Ammizaduga" and "The Hour of Phaethon."
- Venus and Mercury blazed like suns in 685 BC (the year corrected from Eastern Mediterranean chronology) for 40 days, as the result of an unprecedented plasma output by the Sun (the Solar Wind), which was brought on by the sudden reduction in the orbit of Mercury in the year previous. This electric event changed the inclination of the Earth's axis, resulting also in moving the equinox by 15 days.
- A thunderbolt from Jupiter which landed at the Sun on July 25, 685 BC brought the blazing of Venus and Mercury to an end. This is what is recounted in the legend of Phaethon. The calendar dates and intervals are recorded by the *Chilam Balam* and are celebrated in Mesoamerica with site alignments to the corresponding sunsets, and as New Year's day.
- In 685 BC the Earth's axis relocated from the center of the pan of Ursa Major to a location nearer Kochab (called "pole star" in ancient sources) in Ursa Minor in a period of 40 days. Discussed in the chapter "The Hour of Phaethon."
- Before 685 BC, the intersection of the equatorial and the ecliptic was directly below the Pleiades. Thus the Pleiades were seen directly above the rising Sun at the spring equinox. This is attested to worldwide, and matches retrocalculations for the previous location of the Earth's rotational axis. There was no precession of the equinoxes before 747 BC.
- In 685 BC the equinoxes moved 15 days into the future. This did not change the length of the year, but it changed religious feast days worldwide. The inclination of the Earth's axis assumed the current value of 23.5 degrees. It was 30 degrees before that time.
- The last part of Book Five of the *Sibylline Oracle Books* (of AD 115) accurately recounts the changes in the sky in 685 BC. Details can be found in the chapter "Sibylline Star Wars."
- The alignments of ceremonial centers with distant volcanoes in the Olmec region and the Valley of Mexico accurately recall the calendar dates (the horizon locations of the setting Sun) of the catastrophic events of 3147 BC, 2349 BC, 1492 BC, 747 BC, and the axial change of 685 BC. See the chapter "Olmec Site Alignments."

Contents and Resources

I write mostly from memory and do not always get things right. If you find errors, let me know. Questions and differing interpretations are also welcomed. Especially questions. If something is not clear, I need to know, so it can be corrected. I type in a hurry and my word editor is way behind. My e-mail address can be found at the bottom of this page. Tell me which chapter (and revision number) you are reading. But even the mention of a single word will help. I can find the instances (or misspellings) of a word among all 700,000 words of these 41 text files in under a half second.

The "Table of Contents" (a link at the top of this webpage) outlines the narrative and lists the subjects covered by each chapter. There are thirty-four chapters, and 17 appendixes. Many chapters are quite short. Everything can be read in 40 or 50 hours.

The narrative text can be searched for key words. See the Table of Contents page for a search link. There is also a list of **books** and **links** pertaining to the Saturnian Theories. This site currently includes a collection of 7000 mirrored **files** lifted from the web, sorted into 180 topics. The collection can be searched with another search script located also at the Table of Contents page.

Since May 2015, complete book editions of this text are available on line as PDF, EPUB, and MOBI (Kindle) files. I'm indebted to Kees Cook for the conversion scripts. Since 2016 the text is also available as a printed on-demand book in three volumes from the [\[ebooks page\]](#) or from Amazon.com.

As a last note: You may want to skip the first introductory chapters, like Chapter 3, which covers how the polar alignment developed, Chapter 4, which presents a further set of postulates, Chapter 5, which offers the Earth's equatorial rings and discusses dogma and speculation, and Chapter 6, which outlines alternative cosmologies, pictures the scale of the present Solar System, and suggests the foundations for life on Earth. Skip this boring stuff and start directly with Chapter 7 (ice ages, Homo erectus and his Acheulean Hand Axe) or Chapter 8 (Tunguska, Chicxulub, and the Great Lakes atomic detonation).

Endnotes

Note 1 --

The following sites retain a semblance of sanity, express a deep need to investigate, and exhibit considerable creative thinking.

- [\[plasmacosmology.net\]](#) A narrative description, including some catastrophism and mythology. A very extensive site, written in a summary, easy to read style. The

mythology follows Dave Talbott's mostly.

- [\[plasmaresources.com\]](http://plasmaresources.com) A site equal in scope and general interest, run by David Smith. The inclination is mostly toward space science. No mythology.
- [\[sites.google.com/site/cosmologyquest/default\]](http://sites.google.com/site/cosmologyquest/default) A very readable overview of cosmology and plasma theory which generally cuts across the handed-down science. Includes a mythology section. By Michael Suede.
- [\[knowledge.co.uk/sis\]](http://knowledge.co.uk/sis) Society for Interdisciplinary Studies (SIS) site -- the classic site for continued attempts at straightening out the chronology of the Middle East which was first questioned by Velikovsky in the 50s and 60s. Also largely concerned with catastrophism, but almost entirely based on fugitive comets. Some mythology.
- [\[plasma-universe.com\]](http://plasma-universe.com) An extensive collection on plasma theory, developed and maintained as a Wiki site by Ian Tresman of the SIS. No mythology.
- [\[holoscience.com\]](http://holoscience.com) Holoscience, Wal Thornhill's site -- plasma theories at planetary and galactic levels and experimental work applied to the Saturnian Theory. Working in concert with Talbott (see "Thunderbolts" below). A very reductive mythology.
- [\[velikovsky.info\]](http://velikovsky.info) The "Velikovsky Encyclopedia" is a recent endeavor (2009) to provide resources related to the writings and ideas of Immanuel Velikovsky -- under the unique premise that both sides of the "controversy" could be presented (which in effect will go to prove Velikovsky's case). The authors and archivists write under a thin veneer of anonymity. An interesting tangle of pros and cons.
- [\[aeonjournal.com\]](http://aeonjournal.com) Aeon (magazine) site -- a promotion of the Saturn Theory; started by David Talbott. Editors: Ev Cochrane and Dwardu Cardona. Cardona is an imaginative and convincing writer. Cochrane is a tireless researcher. This site periodically disappears off the map. Standing still since 2005.
- [\[othergroup.net/thoth\]](http://othergroup.net/thoth) *Thoth Newsletter* from the Kronia.com site -- which was a standard in promoting the Saturnian Polar Configuration. Kronia.com was discontinued in 2010. But the complete set of the Internet publication *Thoth* can be retrieved from here (and two other locations).
- [\[kronos-press.com\]](http://kronos-press.com) Kronos Press -- Books; and a number of articles by Ralph Juergens originally published in *Kronos Magazine* (and *Pensee*).
- [\[thunderbolts.info\]](http://thunderbolts.info) The parent site to the current endeavors of Dave Talbott and friends. A "picture of the day" feature which always amazes, plus an archive. Collected essays by other people. Promos for recent books and book series. Videos are also available on line (plus DVDs for sale). Connection to a wide-ranging forum on matters of "plasma and electricity in space." No mythology.
- [\[electric-cosmos.org/indexOLD.htm\]](http://electric-cosmos.org/indexOLD.htm) Don Scott's great explanation of plasma theories. An electrical engineer, avid astronomer, and supporter of Saturnian Theory. The link above connects to an earlier version of his book *The Electric Sky* (2006). Try also [\[electric-cosmos.org/index.htm\]](http://electric-cosmos.org/index.htm)
- [\[mikamar.biz\]](http://mikamar.biz) A clearinghouse for books on the Polar Configuration and Velikovskian matters, or, as they say "Products supporting Prehistoric Reconstruction and Plasma Cosmology," and including used books. A valuable resource. Books, but no placed texts on mythology.

- [\[velikovskian.com\]](http://velikovskian.com) A journal of work stemming from the research of Velikovsky. Offers a number of books also. Charles Ginenthal (ed.), Lynn E. Rose, Gunnar Heinsohn, others. Has been standing still for a couple of years. [currently hijacked]
- [\[science-frontiers.com\]](http://science-frontiers.com) "Strange Science, Bizarre Biophysics, Anomalous Astronomy" - from the pages of the world's scientific journals -- always interesting reading. No mythology.
- [\[maverickscience.com\]](http://maverickscience.com) Ev Cochrane's website (editor at Aeon). Includes some of his outstanding articles. Mythology!
- [\[catastrophism.com\]](http://catastrophism.com) Actually a CDROM offering of past literature on the subject. And since 2008 offers some some articles and books.
- [\[varchive.org\]](http://varchive.org) The Velikovsky archive of unpublished documents by Jan Sammer. Mythology.
- [\[mythopedia.info\]](http://mythopedia.info) Marinas van der Sluijs's Mythopedia -- originally based entirely on the image and story evidence of the Polar Configuration, but now given over to mythology explained as auroras. Very professional, very verbose, very physically inaccurate, and offered as a book (or books) in progress.
- [\[bearfabrique.org\]](http://bearfabrique.org) Ted Holden's site which discusses the improbability of dinosaurs being able to move and live with the gravity we experience today. Nice article on the flight capabilities of prehistoric birds. Large collection of other source material in mythology. A few political items.
- [\[grazian-archive.com\]](http://grazian-archive.com) Alfred de Grazia's writings. Everything is in PDF as complete books or in HTML. Absolutely outstanding! *Chaos and Creation* more or less (more less than more) parallels these pages. Of great interest, and totally engaging, is *God's Fire*. This is the story of Moses and the Exodus (1500 BC). Among other things, he reviews works by every biographer of Moses since antiquity, the operation of the Ark, the organization of the camps, the details of the whole migration, the electrical tricks of Moses, his interaction with Yahweh, and the character and psychology of Moses. See also his *The Burning of Troy* and *The Disastrous Love Affair of Moon and Mars*.
- [\[gks.uk.com\]](http://gks.uk.com) It stands for "God-King Scenario" and promotes the book *An Ancient World in Chaos* (2008) by Gary Gilligan with offers for two additional books. An analysis of Egyptian iconography, refreshingly direct and unpretentious, which assigns the Gods of Egypt to the known planets and Hathor to an equatorial ring system. Mythology.
- [\[saturnian.org\]](http://saturnian.org) Saturnian Org. Standing still for a decade -- broken links and a few papers posted.
- [\[creationism.org/patten/PattenMarsEarthWars\]](http://creationism.org/patten/PattenMarsEarthWars) Donald W. Patten and Samuel R. Windsor *The Mars-Earth Wars* (1996). An excellent interpretation of the destructive record of Mars in the 8th and 7th century BC. It is mythology, geography, and celestial mechanics.
- [\[firmament-chaos.com\]](http://firmament-chaos.com) John Ackerman (as "Angiras") *Firmament: Recent Catastrophic History of the Earth* (1996), *Chaos: A New Solar System Paradigm* (2000), and *Pelah* (2006) establishes the repeated meetings of Earth and Mars (and Venus) primarily from Vedic sources. Ackerman is a physicist.

- [\[everythingselectric.com\]](http://everythingselectric.com) "In the theme of an Electric Universe. If the information you seek doesn't exist within these pages, then it probably doesn't exist" says Gary Gilligan. A mythology thread started 2010.
- [\[www.electricuniverse.info\]](http://www.electricuniverse.info) "Highlights the importance of electricity throughout the Universe. It is based on the recognition of existing natural electric phenomena (e.g., lightning, Saint Elmo's Fire), and the known properties of plasmas (ionized "gases") which make up 99% of the visible universe, and react strongly to electro-magnetic fields." A Wiki site; an attempt at universal information. No mythology.
- [\[sites.google.com/site/dragonstormproject\]](http://sites.google.com/site/dragonstormproject) "Recent impact evidence in the Americas. Extensive, map-based graphics." By Dennis Cox.

I may not agree with the physics of many of the cosmologically and catastrophically oriented sites, but their varied interpretation of past events ought to be taken into consideration. The sites (or books) of Patten and Windsor (*Mars-Earth wars*), John Ackerman (*Firmament*), Gary Gilligan (*An Ancient World in Chaos*), and Alfred de Grazia (many well-written on-line books) are independent attempts at postulating cosmologies. They are independent from the current fad of presenting electricity and plasma on a cosmic scale, which offers nice images but no clear path for a history of Earth.

Besides these there are two dozen books (not listed here) which blame any and all catastrophes on cometary impacts despite the fact that we have no evidence that meteors have ever done much of anything to the surface or climate of Earth.

[\[return to text\]](#)

Note 2 --

The September 15, 2007, impact in Carancas, Peru, resulting in a 45 foot diameter crater, was caused by a chondrite (stony) meteorite 10 feet in diameter.

[Image: Carancas, Peru, crater. After Michael Farmer.]

In theory, it should have delivered as much energy as an atomic bomb with an explosive energy of 15-kiloton equivalent of TNT -- enough to destroy New York City -- but there was only smoke and steaming groundwater. People walked over from nearby to have a look.

[\[return to text\]](#)

Note 3 --

The principles of panspermia would claim that life is universal throughout the galaxy, and likely throughout the Universe. This is based on the enormous complexity of cells and their DNA, and also on the fact that so-called 'junk DNA' occurs in almost all plants and animals, and represents a large percentage (80 to 90 percent) of the DNA of complex animals (and plants).

[\[return to text\]](#)

Note 4 --

The date, 2349 BC, as with other dates in the text, was established by medieval and 16th-century chronographers, and seems to be well supported from other data not available to them (such as Mesoamerican written records), as is true for other dates I have used. See Appendix A, "Notes on Chronology."

Date estimates in the Upper Paleolithic and Neolithic were developed from the iconography of figurines in Europe and Anatolia, supported by sequencing of these forms by others, and from corresponding climate data. See the chapter "Saturn and Archaeology."

[\[return to text\]](#)

Note 5 --

The concept of *subjective consciousness* was developed by Julian Jaynes in *The Origin of Consciousness in the Breakdown of the Bicameral Mind* (1976). *Subjective consciousness* involves the ability to recognize yourself as seen by others -- an "analog I" -- which is internalized and placed into the space of the imagination. This represented a new mental space based on a metaphorical displacement of the self, and had not been seen (or recorded) before about 1500 BC. The "space" suggested here is a concept predominantly defined in Indo-European languages. People in cultures based on other grammars have formed equivalent solutions.

You can look through the "eyes" of this "substitute I" or even observe yourself from afar in your mind. Biologically it involves the separation of volition and consciousness in the speech centers of the brain. "Memory" and "self-awareness" are not subjective consciousness, they are simply aspects of consciousness. All animals have memories, all animals are aware of themselves.

Some people never achieve subjective consciousness, yet they appear fully functional. Pre-subjectively-conscious people are almost completely indistinguishable from subjectively conscious people. Pre-subjectively-conscious people can learn anything, including mathematics, and certainly they can joke, have emotions, and carry on convoluted dialogues with others. However, they rely heavily on the learned admonitions of parents and authority

figures ("oughts" and "shoulds") and have difficulty with novel situations. Pre-subjectively-conscious humans also do not have the ability to imagine the reflective thinking of others, that is, how others might imagine them as thinking.

Wikipedia sums it up well under "Bicameralism" as follows:

"Julian Jaynes saw bicamerality as primarily a metaphor. He used governmental bicameralism to describe a mental state in which the experiences and memories of the right hemisphere of the brain are transmitted to the left hemisphere via auditory hallucinations. The metaphor is based on the idea of lateralization of brain function although each half of a normal human brain is constantly communicating with the other through the corpus callosum. The metaphor is not meant to imply that the two halves of the bicameral brain were "cut off" from each other but that the bicameral mind was experienced as a different, non-conscious mental schema wherein volition in the face of novel stimuli was mediated through a linguistic control mechanism and experienced as auditory verbal hallucinations."

The concepts are more fully developed *ad passim* in later chapters. It's not a metaphor, by the way. The left brain is unaware of the activity of the right brain.

[\[return to text\]](#)

Note 6 --

Day of the month dates for the events of 685 BC are accurately recorded in the 16th-century AD Maya *Chilam Balam* as intervals. Knowing the terminal date from other sources, the starting date can be found as well as dates of intermediate events. In addition, the *Chilam Balam* provides "proof" intervals to make its claims, and even lists the European Julian year for the event (as a Tun year). See the chapters "The Maya Calendar," "The Chilam Balam books," and "The Olmec Record." The hour can be pinpointed from an Australian native legend, as well as from the Northern European epic *Beowulf*.

Special thanks to M Signatur for suggesting the expanded synopsis.
Special thanks to K Cook for the HTML to PDF conversion script.

Recovering the Lost World, A Saturnian Cosmology -- Jno Cook

Chapter 3: The Osiris Mystery.

\$Revision: 42.42 \$ (intro.php)

Contents of this chapter: [\[Introduction\]](#) [\[Osiris\]](#) [\[David Talbott's Saturn\]](#)
[\[Adding a Plasma Connection\]](#) [\[The Talbott/Thornhill model\]](#) [\[Objections\]](#) [\[Endnotes\]](#)

"The most 'ancient treasure' that was left to us by our predecessors was the idea that the gods are really stars, and that there are no others."

-- Giorgio de Santillana and Hertha von Dechend, *Hamlet's Mill* (1969), quoting Aristotle [\[note 1\]](#)

The Osiris Mystery

Earth, Mars, Neptune, and Saturn all have their axes of rotation at 24 to 25 degrees to their orbit. This should not be. We would expect all the planets in the Solar System to have their spin axes pointing in the same up and down direction as the Sun. The spin axes of all of the 134 satellites of the planets point in the same direction as their parent planet, with only a few rare exceptions. [\[note 2\]](#)

The divergent and nearly identical inclination of the spin axes of these four planets is one of the first clues to a number of cosmologists that our Solar System is a composite of two systems (although it is a bogus indicator). The other hint was that our ancestors had called Saturn "the Sun," "the best Sun," "the first Sun." Perhaps Earth had at one time been a satellite of Saturn, or a planet orbiting Saturn? Saturn has all the look of a burned-out brown dwarf star which in the past could have supported life on closely orbiting planets. At some time in the past, Saturn with its planets might have entered the Solar System and the two systems merged. But when and how did this merger take place? [\[note 3\]](#)

Introduction

In 1960 David Talbott started investigating the ancient literature of Mesopotamia and Egypt, and soon came to the conclusion that, in fact, Saturn had stood in the sky, ablaze like a sun, during an earlier period recalled by people of the second and third millennium BC.

[Image: The Egyptian "Eye of Ra" representing the unity at the beginning of time. It first appears early in the Old Kingdom of Egypt. In the Middle Kingdom the parts of the sign become symbols for fractions of the number one. Source: public domain.]

Talbott concluded that, before about 3000 BC, Saturn had stood over the North Pole of Earth as an immense globe, connected to Earth with a stream of dust or water, with Mars in an intermediate position. The period of this polar apparition was universally remembered throughout the world as the "Era of the Gods." During this time, Saturn ruled and man lived in paradise with the Gods. The closing of that time was mourned throughout the world and has shaped us ever since. [\[note 4\]](#)

The ending of the "Era of the Gods" (in 3147 BC) brought on an explosive rise in civilization: intensive agricultural practice (simultaneously in five or more unrelated regions), monumental constructions, cities, writing, kingships, and wars of conquest. The "Era of the Gods" permanently set our concepts of Gods and heaven and became the basis of all religions. It shaped our languages, architecture, and political systems, and even our ferocious antipathy toward our own species. Most importantly, humans developed a *subjective consciousness* some time after the close of the "Era of the Gods." The acquisition of subjective consciousness was not a certain process nor universal. I'll detail this along the way with the narrative.

In the present chapter I'll describe how an explanation of the mechanics of Saturn as a Polar Sun developed in the 20 years since 1980. In subsequent chapters I'll detail the significant events leading up to the Polar Sun and from there to the historical age of the seventh century BC. This chapter will touch on all these events to some extent, but mainly on the Polar Sun scenario.

Osiris

In the first century AD, Plutarch, in his essay "Concerning the Mysteries of Isis and Osiris," described the strange liturgies of the Egyptians. Plutarch was at a loss to explain the story of Isis and Osiris which so pervaded all of Egyptian thinking. Plutarch's reaction was based on 400 years of Greek common sense. He thus reduced the story to a series of metaphors and similes, even equating the death and resurrection of Osiris with the rise and fall of the Nile and the growth of vegetation. But it becomes obvious from Plutarch's repeated attempts at explanation that he failed to understand the mysteries which in his time were already 3000 years old.

We will progress no farther than Plutarch in our attempt to explain myths and the mythical histories of the Gods if we refuse to accept myths at face value -- that is, as long as we persist in metaphorical explanations. I do not believe that the myths of antiquity were written as metaphors for lightning, sunshine, or spring, or as guides to moral behavior. This last is especially suspect, for if myths form the basis for religion, one would expect them to have some exemplary content. However, this is universally lacking. Myths have no point to make. The myths are, in fact, history. They need to be understood as literal rather than as metaphorical, allegorical, philosophical, or symbolic. This is important, and something I will adhere to throughout this text, similes excepted. [\[note 5\]](#)

In the 1980's I ran into Immanuel Velikovsky's books. Velikovsky managed to bring ancient myths together into a more or less cohesive story which retold the myths as history -- specifically a history of planetary events affecting the Earth. Velikovsky published *Worlds in Collision* in 1950 and *Earth in Upheaval* in 1955. [\[note 6\]](#)

Worlds in Collision is actually very readable and started to answer many questions about antiquity, about the strange concerns and thinking of our ancestors, and about Mesoamerica. However, there are problems with some of Velikovsky's research. *Worlds in Collision* seems at times dated, for, despite the fact that nothing more relevant exists, many of the sources are retellings from earlier events or from late antiquity. Just as suspect for us are the quoted sources from the late 19th through the middle of the 20th century. References in *Worlds in Collision* are at times selectively quoted (although I find this less troublesome) and more frequently attributed to the wrong era.

Velikovsky's second book, *Earth in Upheaval*, was presented as a compendium of physical data (mostly geological) bearing on the subject, but the data fails to be convincing, whereas the literary sources of the first book succeed in telling a believable story. Of course literary mythological sources are incomprehensible to scientists, if not complete anathema, so that the major contemporaneous critiques of Velikovsky, which universally came from staid scientific disciplines, centered on the mechanics of astronomy and astrophysics.

The reason for the failure of the scientific community to penetrate *Worlds in Collision* should be obvious: The mythology, and the history implied in the mythology, were completely outside the range of training and knowledge of the astronomers and physicists who got involved. The scientists simply did not know what to talk about, and addressed themselves to

side issues of physicality instead. The validity of myth and ancient history could not be understood.

And although mostly the critiques represented reactions to Velikovsky's suggestions of catastrophism, catastrophism soon entered the very disciplines which had objected to it so vehemently, although always placed safely distant in the past. The acceptance of the giant meteor (meteorite) crater depression in the Yucatan as indicative of a catastrophic event (responsible for the worldwide K-T boundary layer of Iridium dated to 65 million years ago) was an admission by the scientific community that "such things" could happen. Academics might entertain catastrophes millions of years ago, but not within recent historic time.

Velikovsky, however, dealt specifically with historical time, not geological time. *Worlds in Collision* recounts how Venus ran on an eccentric orbit around the Sun in the second millennium BC, crossing Earth's orbit regularly. Velikovsky suggested that Venus had been recently expelled from Jupiter, that it showed with the tail of a comet, and that it approached Earth in 1492 BC, swinging around it before proceeding on its course, to return again 52 years later for another approach. [\[note 7\]](#)

Going by the physical characteristics, Venus was created recently. There are many claims in antiquity to this -- "born of Zeus" -- that is, Jupiter. Some people point to the red spot of Jupiter to surmise a possible mass expulsion. Venus was, however, not an expulsion of Jupiter, but an escaped satellite of Saturn. It most likely had its genesis in the mass expulsion of 4077 BC. It shows up in Egyptian iconography by 3100 BC, in the earliest depictions of the Horus/Mars pharaoh figures, where the pharaoh wields Venus as a club to pound a captive. The notion that Venus originated from Jupiter was promoted by Velikovsky, and stands today as the most persistent error which continues to foment flights of rhetoric among cosmological fanatics and establishment academics alike.

Velikovsky held that the approaching planet was taken by the Hebrews to be the savior God of the Exodus. The Hebrews left Egypt during the confusion and devastation which resulted from the alignment with a planet of equal size to the Earth. It caused the demise of the Middle Kingdom of Egypt. The Earth's orbit increased, and the year lengthened. It is only becoming clear during the last decade how this could have happened and what the forces between the two bodies would have been.

The "close approach" in 1492 BC was probably a separation of some 10,000,000 miles (16,000,000 km). The "collision" was due to an electric field force, not a physical impact or due to gravitational interactions. I'll clear up the matter of electric effects in later chapters and Appendix B.

Worlds in Collision relates another disturbance of Earth in 747 BC, one instance of a series of disruptive close approaches of Mars, at one time involving also the Moon and Venus. The details of these interactions are described vividly in the *Iliad* as the combat of the Gods in the heavens paralleling the Trojan War by the mortals below. The *Odyssey* recounts the play of

Mars and the Moon, as does the Mesoamerican *Popol Vuh*. In 747 BC the year lengthened to 365 and 1/4 days. Everywhere calendars were updated, most often by adding five days to the end of the old year. This epoch of over a hundred years (806 BC to 686 BC) closes with Mars and Earth taking on their current positions around the Sun and a change in the shape of the Earth's orbit. [\[note 8\]](#)

Both Venus and Mars were held in awe by people everywhere, and Venus in particular was closely watched for a period of over 4000 years (since 2349 BC) in Mesoamerica to the complete exclusion of the Sun and the Moon. This, in fact, is one of the most curious aspects of our historic past. As Velikovsky wrote:

"The Sun and the Moon are two great luminaries, and it is easily understandable that the imagination of the peoples should be preoccupied with them and should ascribe to them mythological deeds. Yet the ancient mythologies of the Chaldeans, the Greeks, the Romans, the Hindus, the Maya, preoccupy themselves not with the Sun or the Moon, but prima facie with the planets."

-- Immanuel Velikovsky, unpublished document at www.varchive.org

Not everything written by Velikovsky is plausible; for example, his suggestion that small flies descended from Venus on a "close approach" to Earth! His theories of the separation of atmospheric gases likewise do not stand up well to accepted postulates of chemistry and physics. But Velikovsky never attempted to define a physics for his described events, although he checked closely with people who would know and thus seldom misspoke his conclusions. [\[note 9\]](#)

Naturally, when Velikovsky missed some point, his critics would pounce on him like tigers. But the force of his argument does not derive from physics or exact dates (although he had a penchant for dates) but from an accumulation of literary sources. I struggled with the mechanics involved in the "close approach" of Earth and Venus, but what rang most true for me was his recitation of the ten commandments in Hebrew as the groans of an Earth writhing with seismic waves -- when the mountains groaned and "the hills danced like little lambs."

Velikovsky spent much of the rest of his life defending his theories, demanding tests be made by the Establishment, and making predictions. In the eyes of his critics he was all too frequently correct. He had an amazing ability to connect disparate information and to see connections where others could not. He wrote a number of additional books dealing with the chronology of the Middle East, filling 600-year gaps. Most of that later work either has been accepted or is still under discussion. [\[note 10\]](#)

Velikovsky had intended to write a history of events preceding the contact with Venus in 1492 BC, but put it aside. Some snippets can be found at www.varchive.org under the subject heading of "In the Beginning." It would have involved Mercury, Saturn, and Jupiter. One comment he made was that he thought the Earth had at one time been a satellite of

Saturn. That suggestion started David Talbott on a search for contrary evidence.

David Talbott's Saturn

David Talbott initially sought to disprove Velikovsky's notion that Earth had at one time been a satellite of Saturn, but twenty years later he was solidly convinced otherwise, publishing *The Saturn Myth* in 1980.

The Saturn Myth held that, in the early history of Mesopotamia and Egypt, Saturn had loomed very large over the North Pole of the Earth, with Mars and "Venus" in between (actually, from my determination, this last was Mercury) and all four connected by a stream of particles of dust or water -- the *axis mundi*. Absurd as this might seem initially, all the religious documents of the early Middle Eastern civilizations point to the same idea, as do Chinese, Celtic, Maya, and Norse recollections, the Vedas, and the legends of people elsewhere throughout the world.

The Sun (our current Sun) was but a minor character in all this. One role it played was to light up the edge of Saturn. This became the first index of the passage of time, the first "clock." (Saturn or Kronos translates to "time.") From the Earth, below the south pole of Saturn, a crescent could be seen rotating on a daily basis around the edge of the immense globe, which was suspended above the north horizon as the Earth turned.

The configuration of Saturn, Venus, Mars, and Earth all in a line (the "polar alignment") presented some very real dynamic problems, for it was initially thought that all the planets were located in the same plane, that is, the ecliptic, and rotated around the Sun in unison, with the Earth's North Pole pointing toward Saturn. The idea that Saturn revolved around the Sun with the other three planets hidden behind it -- called the "shishkebab alignment" -- would in effect have placed Earth on its side. The crescent seen on Saturn, under this model, was thought to be the planet Jupiter, located between Saturn and the Sun, just partially visible and lit by the Sun.

But it wasn't so.

The stumbling block in this five-planet shishkebab, as first proposed, was the suggestion that all the planets would, in effect, be on their sides. If this whole arrangement orbited the Sun, the direction in which the poles pointed would constantly change. The dynamics of such an arrangement are completely untenable, despite the acceptance of this configuration by a number of physicists and aerospace engineers. Earth is a gyroscope, and twisting a gyroscope's spin axis makes it react violently. The Earth would have split asunder from the forced change in rotational momentum.

It is absolutely astounding that for a period of twenty years, no one seriously objected to the shishkebab alignment, excepting a few physicists, like Tim Thompson, but none of these

stated the obvious: that any change in the direction of the rotational axis of a planet would set it into a violent gyroscopic reaction. Rather than that, which was the first thing that occurred to me when I heard of the shishkebab proposal, we get endless references to Kepler's Third Law (the planets would be traveling at different orbital radiuses at the same orbital period), and even more talk of what theories are supposed to do and prove. What an enormous waste of time that was. It was only Wal Thornhill's contribution in about 1995 which in one stroke of genius cut through this Gordian knot of unimaginative scientificism. I'll detail that further below.

One of the first independent analyses of the dynamics concluded that this configuration would only work if Mars were allowed to oscillate between Saturn and Earth -- thus alternately coming closer to and receding from the Earth. Strange as the shishkebab alignment was, this was even stranger, yet this is what Talbott had surmised from his investigations but never published as part of *The Saturn Myth*.

Details of *The Saturn Myth* were argued for 20 years. During that time there were a number of competing models, all created to fit the imagery derived from before 3100 BC. Interestingly, the imagery was never in question. Some researchers disputed the assignment of planet names to the polar apparition, and some argued for completely different phenomena. But there has been little disagreement that the imagery appears universally, certainly within the region defined by cultural diffusion from Mesopotamia -- to Egypt, Greece, India, and Rome.

Concordance from further afield was spotty and often could be argued as selectively picked, but most is better established today. There is evidence of these tales from Africa, Mesoamerica, South America, China, and Oceania, but on a lesser scale and always much later. Van der Sluijs at one time said, "None" for further evidence. But he also did not consider the creation "myths" from China, or the Nordic tale of heaven atop a tree, in effect the *axis mundi* seen from a completely different vantage point (as the "bridge to the Other World"), or the underlying strata of mythical elements which show up in Mesoamerican and South American sources.

There is, in fact, a clear record from Mesoamerica provided in the texts of the *Chilam Balam* books of the Maya, although these are horrendously arcane and almost indecipherable, especially if a prior model is not available to the reader during an attempt to crack the arcana of the texts. Once I had devised a reasonable chronology of the events from Mediterranean (and Chinese and Vedic) sources, I started, in 2006, the task of attempting to read the Maya *Chilam Balam* books. I realized soon that all that was told to have transpired by records of the Mediterranean region, was duplicated, complete with dates, in these Maya Books. However, it took over four years to decode the *Chilam Balam* to my satisfaction.

Meanwhile, back to the 20 years after 1980: it was initially surmised for the shishkebab model that the large globe suspended above the North Pole had existed since before the Old Kingdom of Egypt (before 3000 BC) and came to a final end with the dissolution of the Old

Kingdom (after 2300 BC). Both date estimates proved to be incorrect, especially in that there was no information about what might have come before 3000 BC.

The era before 3000 BC became a field of speculation for some authors. Many assumed that Earth had *always* existed below the south pole of Saturn. Dwardu Cardona could imagine life developing on an Earth enveloped within the coronal glow discharge of the sun Saturn.

[\[note 11\]](#)

Whatever brought the polar alignment to an end also remained a complete mystery, but its demise was to be preserved in the religious observances of Egypt as the tale of Isis and Osiris. For thousands of years, Egypt remained an extremely conservative society. The 1000-mile-long landscape, bordered by deserts on both sides, kept Egypt from invasion and from many outside influences and, together with its successful agricultural production, provided no reason to do anything different from what had been done in the past. If we were to seek a single reliable record of a worldview from antiquity, it would be Egyptian. It was the Egyptian sources which Talbott used for his book *The Saturn Myth*. [\[note 12\]](#)

What brought the Saturnian Polar Configuration to an end was an interaction with the planet Jupiter, which at that time orbited much closer to the Sun. Jupiter is massive -- it has more mass than all the rest of the planets of the Solar System together. Jupiter is also stable. With an enormous mass and rotating at a period of 9 hours today, it represents almost all of the rotational momentum of the Solar System. Jupiter would not budge. It tore the gas giant Saturn apart -- or so it looked from the vantage point of Earth.

This became the Egyptian tale of Osiris (Saturn) who was killed and dismembered by his evil brother Seth (Jupiter), his body parts strewn along the Nile river (the river of the zodiac, at that time already visibly cluttered with dust) and resurrected as Horus (Mars). The sister of Osiris, Isis (Venus), collected his body parts for burial and was instrumental in his resurrection as Horus. Other Middle Eastern sources have similar tales. St. Paul readily equated the death and resurrection of Christ with that of Osiris. Throughout all of the world (except initially in Egypt) Jupiter (the name translates as "youth" or "the younger") gains ascendancy to become the new primary god. In Egypt, Jupiter is identified first as Seth, the evil killer of Osiris, but later, and certainly by the time of the first spells of the Egyptian *Book of the Dead*, as Osiris himself. [\[note 13\]](#)

Adding a Plasma Connection

Wal Thornhill ran into the cosmology of Talbott by accident, and immediately understood it in completely different terms. Having studied the works of plasma theorists, which hold that the nature of the sun is not nuclear but electric and that virtually all phenomena in the Universe are exhibitions of plasma flows, Thornhill was able to bring a completely different approach to the mechanics of the Saturnian Polar Configuration.

First, he assumed that the shishkebab formation consisted of planets stacked one above the other -- all at nearly the same distance from the Sun. Second, he maintained that the connecting stream between the planets wasn't water or dust -- it was a plasma stream from Saturn at glow or arc mode.

Thus Thornhill's major change in the model was to stack Saturn and its planets one above each other -- a stroke of genius -- which accomplished what had long been surmised but never related to physics. In rotation about the Sun, the side of Saturn would now be lighted by the Sun. Seen from below Saturn, this would be a crescent rotating about the planet. In this position the axis of Earth would not be subjected to a constant twist. All the planets would thus travel on about the same orbit around the Sun, although above or below the orbit of Saturn.

I'll discuss plasma here briefly. For more information see the websites of Wal Thornhill, Don Scott, and Anthony Peratt. For an independent view see the site of Laszlo Kortvelyessy.

[\[note 14\]](#)

A plasma stream represents a flow of electricity (a current) through an ionized or easily ionized low-density gas. The current could be composed of electrons, negatively charged ions, protons, or positively charged ions, in any mix. The number of electrons or ions need only represent a few percent among the gas molecules (or conductor).

The flow of positive or negative charge carriers can happen simultaneously and would flow in opposite directions. (By convention, the "current" is defined as flowing in only one direction, opposite the direction in which electrons move.) The space between stars, and even between galaxies, contains enough electrons and protons to allow the flow of plasma in absolutely huge quantities. The "vacuum" of intergalactic space thus supports plasma streams billions of miles wide and light years long. These can often be seen in X-ray imaging, connecting stars as well as galaxies.

A plasma flow could thus be understood as a very low-density gas; however, it does not behave as a gas. It is electric in nature, not unlike the controlled current flows we use for electricity in wires. The plasma current flow results from a difference in the electric field potential from place to place -- think of it as a "voltage difference."

[Image: Voltage and amperage relationship for plasma. Notice the hysteresis effect between dark and glow mode. After Don Scott.]

Plasma streams take three forms. The "dark mode" represents the least current density, and is invisible. In "glow mode" the flow is visible because the increased energy of the electrons makes them radiate light. In "arc mode" the ionized media is so energized that it radiates not only visible light but also in ultraviolet and x-rays. Although arc mode represents the highest current flow, the discharge in arc mode still takes time because plasma streams are self-limiting even at large current levels.

Plasma streams tend to organize into bundles, induced by the constriction of surrounding (circular) magnetic fields, which are in turn generated by the current flow. Since plasma exhibits a negative resistivity in arc mode, this also tends to form plasma streams into bundles, since the increased density allows transmission at a lower resistance. At smaller dimensions, as in plasma streams between planets, these bundles tend to form into twisted pairs, called Birkeland currents. [\[note 15\]](#)

The common "flash tube" used for cameras is a plasma discharge through an ionized gas. Ionization is accomplished by means of a high-voltage pulse fed to a wire adjacent to the tube. The flow of current (amperage) within the tube can be astoundingly high -- currents in flash tubes often exceed a thousand amps. Only the fact that the flash is of very short duration (1/1000 to 1/2000 second) keeps the glass from melting.

Plasma streams are applied commercially, as (for example) in neon signs, neon lamps, UV lamps, pulsed xenon lamps, carbon arc lamps, electric arc welding, and electronic flash.

Plasma streams are used in precision metal milling, and in (some) radio vacuum tubes and gas rectifiers.

Natural plasma displays include electric arcing, lightning, ball lightning, Saint Elmo's fire, auroras, such obvious phenomena as flames, and less obvious phenomena such as hurricanes, tornadoes, and water spouts. Plasma in space is seen at galactic dimensions and between binary stars. In our Solar System the multi-million-volt lightning strokes between the rings of Saturn are plasma displays, as is the generation of the light of the Sun. The coma and tail of comets are plasma discharges in glow mode. (The secondary curved tail consists of expelled dust.)

The most spectacular display of plasma in arc mode is seen at Jupiter's satellite Io, which has a "volcano" facing Jupiter that has been belching incessantly and continuously for all of the 30 years since it was first spotted in 1979. (There are additional "volcanoes" like this.) During that time it has moved 50 miles (80 km) and never built a cone. In fact, all the "volcanic" spots on Io are depressions instead. Although it looks like a volcano of unlimited capacity, it is a strike point of a plasma stream between Jupiter and Io. The plasma stream is dispersed over a wide area at Jupiter (actually at the pole) and thus at a diffuse density -- in dark mode -- but it is concentrated at Io in a single spot (the closest point to Jupiter), thus driving the current density up to such a high level as to be in arc mode. The current flow is estimated at 5 million amperes. [\[note 16\]](#)

Venus's planetary plasma tail extends some 30,000,000 miles (48,000,000 km) away from the Sun as a plasma stream in dark mode, and consists (as recently found by a spacecraft) of a twisted string -- a Birkeland current. [\[note 17\]](#)

The Talbott / Thornhill model

Thornhill also made it obvious that planets are globes which each carry an electric charge and it is this -- their electric field -- which keeps them apart. The planets in the Saturnian Polar Configuration would keep their distance from each other because the electric field repulsion which would overwhelmingly exceed any gravitational considerations. But this is probably not a simple matter, especially if Saturn was indeed positively charged. I will take this up again in Appendix B.

Thornhill proposed in 2001 that the Saturnian System, including the planets Earth and Mars (he did not believe that Venus was part of this group) first entered the Solar System in circa 3200 BC and approached from below at an angle of 24 degrees to the ecliptic. (The ecliptic is the band more or less at the level of the Sun's equator in which all the planets move, but actually is defined as the orbit of Earth around the Sun.)

This suggestion solved the problem posed by the continuous change in the spin axes of the planets required by the shishkebab model. The spin axes of all the planets would now remain

unchanged as the Saturnian System (sort of) corkscrewed into a circular orbit on approaching the plane of the ecliptic. After a relatively quiet period, during the "Era of the Gods," the three planets would join the other solar planets, although not until a number of violent interactions displaced Saturn, Mercury, and Mars to more distant locations (plus a relocation of the nearby Jupiter). Thornhill estimated that the corkscrewing action would have taken less than 300 years. [\[note 18\]](#)

By the Talbott / Thornhill model, Earth would have existed within the glow level plasma discharge (the coronal envelope) of Saturn before the intersection with the Solar System, and within the memory of mankind. This condition would have provided an amount of light which did not vary from day to night. The stars and other planets might not have been visible, and perhaps not even Saturn would have been seen -- just the "waters above."

Then, as Thornhill would suggest, on approaching the Solar System from deep space, and finding itself in a space dominated by the electric field of the Sun, Saturn would shrink its discharge envelope until Mercury, Mars, and Earth were located outside the sphere of visible discharge. On approaching the Sun, Saturn would become visible in the "waters above" as a giant globe hovering in the sky at the North Pole.

This scene is, in fact, the worldwide scenario of creation: First there is darkness; then Chaos; which dissolves into an image of a large globe. The waters above dissolve to show "land" -- the original land of Paradise. Everywhere this land was called "Earth," while the place where humans lived was called "Lower Earth" or "Middle Earth."

As Saturn changed to an arc mode discharge the previous encompassing glow discharge disappeared. Saturn suddenly lit up like a sun and connected to Earth, via Mercury and Mars, with an electric arc. The Gods were born, and "creation" ensued. The waters below separated from the "waters" above and light was created -- not the light of the Sun, but the coronal discharge of Saturn. As related in all creation mythologies, mankind was witness to the birth of the Gods and the creation of the Universe. The Universe, however, consisted only of "Upper Earth" in the north populated by Saturn's satellites, and (as I will detail later) the Earth's equatorial rings standing in the sky in the south, thought to also represent an ocean. Humans thought of themselves as living in a valley between these two regions. Only in the far north of Earth was it obvious that the globe in the sky was nearly overhead. [\[note 19\]](#)

Objections

Thornhill's plasma electric model solved many of the problems of Talbott's composite imagery. However, Thornhill suggested an initiation of the signs in the sky in 3200 BC, and a demise within a few hundred years. I really doubt that there was such an easy transition. The description is correct, but simplified. It must have been considerably more complex and violent. And it would have taken much longer. I think, in fact, that altogether it took over a half billion years since the first intersection of Saturn with the Solar System to evolve into the quiescent conditions we experience today. The following are three objections to some aspects of this model:

- **First** of all, objects entering the Solar System from afar go into wildly eccentric orbits, rather than circularizing gracefully within a few hundred years, no matter from which direction they come. None of the present planets have as yet settled down to orbits flattened to the equator of the Sun and not all have circularized their orbits. [\[note 20\]](#)
- **Second**, Saturn would not gently corkscrew its way into the ecliptic to find a location among the other planets. If Saturn came into the Solar System from outside, it would act similar to a comet on approaching the Sun. The Sun is big -- 12 times the diameter of Saturn and with more than 3,500 times the mass. Saturn would be gravitationally attracted and would speed up on approaching the Sun, whip around the Sun at close range (the perihelion of its orbit), and then disappear into space to return again after a very long interval.
- **Third**, in the Thornhill model (as originally presented) the Saturnian System entered the Solar System from below the ecliptic. This was based on the unstated assumption that the Sun and its planets (and by extension, any star) together move in the direction of the Sun's north pole -- what we would call "up." This is, in fact, the movement of the whole Solar System in its rotation about the center of the Milky Way Galaxy. But there is no particular reason why the Saturnian System would be moving in a similar manner, that is, in the "up" direction of the axis of Saturn, except to allow Mars and Earth a position below the South Pole of Saturn.

What is important is that the direction of the spin axis of Saturn and its satellites would not likely have changed. They are today still at 31 degrees to the axis of the Sun (24 to 27 degrees from perpendicular to their individual orbits). Spin (rotational momentum) represents an enormous amount of kinetic energy and as a result spin is very stable.

By 2008, the original scenario had been modified somewhat by Thornhill, and this requires some quoted text and comments, because here we see a critical theory being developed. Thornhill is here the apologist for development of theories to be used by Cardona. In an essay "Assembling the Solar System" (2008), at [\[www.holoscience.com/wp/assembling-the-solar-system\]](http://www.holoscience.com/wp/assembling-the-solar-system) he writes:

"So what I'm suggesting is quite radical -- that all of the planets and moons in the solar system did not originate with the Sun, they were captured. Capture of a brown dwarf star [meaning, Saturn] begins when the plasma sheaths touch and they 'see' each other electrically for the first time."

"The brown dwarf changes from being an anode in a galactic discharge to a cathode in the Sun's environment. The adjustment is drastic. The brown dwarf is no longer a star. It becomes the mother of all comets and subject to a steady electrical acceleration toward the Sun."

What Thornhill is pointing out here is that unlike electric charges attract. True enough. If, that is, a star entering the Sun's plasmasphere would represent a body charged to a large negative value. He then assumes that the positive charge of the Sun is enough to draw the outsider into the plasmasphere of the Sun, and it would travel to the Sun. But this also neglects the protective plasmasphere of Saturn, which would isolate it from "seeing" the electric properties of the Sun.

Is any of this true? Perhaps some of it. We do not know exactly. Astrophysics is speculation, constrained, like fantasy, by some of the laws of nature that we think we know. I suggest that Thornhill is here neglecting the isolating double layer of the plasmasphere of Saturn. Gravitational attraction would be enough to bring it to the Sun.

On entering the domain of the Sun, Saturn, carrying a large positive charge, would be under the onus of a mismatched charge level, and thus would attempt to gather electrons from nearby space and perhaps mainly from any nearby objects, including its own satellites, and certainly its companion planets. Travel toward the Sun through the increasing electric field would continue to cause a mismatch, even on the second half of Saturn's path, away from the Sun. Saturn would have 15,000 years to do this with each entry into the Solar System and into the plasmasphere of the Sun. That simply is not enough time for a star to lose its positive charge. [\[note 21\]](#)

Electricity by itself would not move Saturn. The example used by Thornhill is of the two Pioneer spacecraft which are being minutely retarded in moving away from the Sun toward the edge of the Sun's plasmasphere. But these are experiencing forces which are far too minute to accelerate them backward to the Sun. It is certainly not doing this for these two satellites. Thornhill writes:

"That acceleration [of Saturn toward the Sun] will tend to cause the satellites of the brown dwarf to be dislodged from their orbits and, in a dynamic equilibrium, strung out behind in their primary's cometary wake. Since a comet's ion tail is a discharge current, the satellites will experience 'mega auroras' and devastating interplanetary discharges to varying degrees."

This is complete malarkey and absolute nonsense. You have to ask, how would a planet's

satellite end up in its ion stream, which is made up of repelled gas ions at best? Interplanetary space is not a substance which drags satellites away from a planet. I would seriously disagree with the "dislodging of satellites." Gravitational theory contradicts this completely. The satellites will stay exactly where they can still be seen today. We have seen nothing like this, and, in fact, all the satellites of Saturn have come through displacement experiences in one piece, except for scarring.

But this particular image, of the satellites of Saturn moving into a "wake" behind Saturn, as if we are racing through a lake, corresponds to the belief among some of the Electric Universe catastrophists (notably Cardona) that Earth and Mars came into the Solar System while positioned below the pole of Saturn. With Saturn entering the Solar System from below, as proposed above, the "left behind" satellites would have been somewhere below Saturn.

There are problems associated with the "left behind" scenario besides the fact that it is science fiction. There are too many unsupported "iffy" clauses. We just have too much data which points to a much, much longer transition period between the entry of Saturn into the Solar System and the ultimate strange polar configuration of the planets -- the last of which was all seen to happen within human memory.

Not the least of the problems with this scenario is that I am not aware that Saturn at any time took on the looks of a comet, what Thornhill calls, "the mother of all comets." I have never noted in any mythology anything representing a tail for Saturn, like a beard or long hair (as with Venus, Mercury, and the Moon). So in my opinion there would be no Saturnian satellites "strung out behind in their primary's cometary wake." There would be no wake and no primary or secondary tails and no bow shock either.

All these lacking characteristics are the result of the very high positive charge with which Saturn would have entered the Solar System, and the resulting electric field centered on itself and its companion planets.

There are other particulars which I disagree with. But it will not do to continue this critique. Let me instead suggest a constitution of the Solar System which will be developed in more detail later.

- **First**, I am suggesting a far longer period of interaction between Saturn and the Solar System and a far more complex series of interactions. Some of the interactions can be traced and dated. We have the information at hand.
- **Second**, as Saturn repeatedly closed in on the Sun (at 27-million-year intervals), it would retain most of its original planets as satellites, but some satellites might be wrenched free and start orbiting the Sun independently (even if difficult to imagine within the limits of astronomical physics). [\[note 22\]](#)

Any planets lost from Saturn would probably orbit the Sun on close orbits, much closer than Earth's present orbit, with differing inclinations to the ecliptic and

probably also with differing eccentricities. Eccentricity is a measure of how much an orbit deviates from the circular, and thus how elliptical the orbit is. Seldom, if ever, would these orbits intersect. Saturn, because of its considerable mass, would remain on its very eccentric orbit, with the closest approach to the Sun (perihelion) near the orbits of these planets and an aphelion billions of miles away. And Saturn would show up only infrequently.

- **Third**, I would locate Jupiter much closer to the Sun during this period. At one time we assumed, from the knowledge of *our* Solar System, that other star systems would exhibit similar structures -- small planets in close orbits and larger planets in far orbits. The Earth today is located at a distance of 93,000,000 miles (150,000,000 km) from the Sun, called an Astronomical Unit (AU).

Jupiter is today located 5 AU from the Sun; Saturn is at 9 AU. Uranus and Neptune are far beyond that. However, we have since found over a hundred stars with indications of planets and, in all cases, we have been astounded that these stars have planets the size of Jupiter at distances of only one to two AU from the star -- that is, not much further away from the star than the current distance of Earth from the Sun.

It would thus not be unreasonable to suggest that, at an earlier time, Jupiter might have orbited the Sun at only one or two AU. At this location Jupiter would have a strong influence in modulating the orbits of any of the inner planets, and eventually provide the cause for the close of the "Era of the Gods."

- **Fourth**, what I will also suggest is that Saturn probably first intersected the Solar System at the start of the Cambrian, 560 million years ago. At that time the Saturnian planets (satellites), including Earth, continued to travel with Saturn, protected by the coronal envelope surrounding Saturn.
- **Fifth**, I will further suggest that Earth was captured by the Sun only after the Permian, 250 million years ago. For most of the time following the Cambrian, Saturn remained on an orbit with an extremely long period, crashing through the inner portion of the Solar System only infrequently.
- **Sixth**, sometime after the last three million years, however, that period was greatly reduced so that, by the time of the first humans, Saturn swept through the inner planets regularly, at perhaps 4000 year intervals.

Endnotes

Note 1 --

"Our forefathers in the most remote ages have handed down to their posterity a

tradition, in the form of a myth, that these bodies are gods, and that the divine encloses the whole of nature. The rest of the tradition has been added later in mythical form with a view to the persuasion of the multitude and to its legal and utilitarian expediency; they say these gods are in the form of men or like some of the other animals, and they say other things consequent on and similar to these which we have mentioned."

-- Aristotle *Metaphysics* Book 12

[\[return to text\]](#)

Note 2 --

The angle of the axis of a planet to their orbit is not actually a good indication of a familial relationship. Where the axis points to in the dome of the stars is a much better index. On this basis it will be noted that the axis of inclination of the Earth and Mars are not anywhere alike, even though the numerical values of the angles are nearly equal.

For the planetary satellites, it should be noted that almost every satellite of every planet revolves around the parent planet *at the equator* of the parent planet, with the satellite's axis parallel to the axis of the planet -- even the wildly tilted planet Uranus. Our Moon is not a satellite. It is a planet sharing the same orbit around the Sun as Earth.

[\[return to text\]](#)

Note 3 --

Saturn is about the right size to have been a minor star and was thought to be a ball of gas, although today it is known to consist mostly of liquid hydrogen -- not typical of a star by current precepts. Yet the amount of energy put out by Saturn today (including plasma flows, x-rays, and radio waves) exceeds the amount received from the Sun by a factor of three (where the Sun's energy is calculated as impinging heat and light radiation). That Saturn may have been a star has been suggested by any number of people over the years, but this theory was based on calculation of the mass of Saturn which suggested that it was composed almost entirely of gases.

[\[return to text\]](#)

Note 4 --

See David Talbott, *The Saturn Myth* (1980).

The conclusion that Saturn had stood at the North Pole is generally held by most mythologists, from worldwide sources, although it has remained inexplicable how this could be.

Giorgio de Santillana and Hertha von Dechend, in *Hamlet's Mill* (1969), came to the same conclusion although the authors then deny their findings because the conclusion was so

unbelievable. Instead they attribute the primacy of Saturn in antiquity to a metaphor for the precession of the equinoxes, and posit this understanding and a very early Neolithic awareness of precession to be the case for all societies in the world. Anecdotally, de Santillana and von Dechend started their investigation in order to disprove Immanuel Velikovsky's claims, as described in his book *Worlds in Collision* (1950), of a series of catastrophic contacts between the planet Venus and Earth in 1492 BC.

Dwardu Cardona, in *God Star* (2006), furnishes a major update of the earliest mythological recollection from worldwide sources.

[\[return to text\]](#)

Note 5 --

"Myth narrates nothing," writes Jean Markale in *The Celts, Uncovering the Mythic and Historic Origins of Western Culture* (1978), refuting Mircéa Eliade. We all too readily resort to using metaphors, since "metaphor" forms the basis of all our thinking and some people will insist that the metaphorical is *the only* interpretation of myth. It is all too easy to slip from similes to metonymies or synecdoches. Leroy Ellenberger's 1994 critique of Talbott's book, *The Saturn Myth*, reads, in part:

"He [Talbott] insists on literal interpretations of texts ... to the exclusion of metaphor and many other modes of expression."

-- Usenet talk.origins group, 1994

However, Talbott is correct in attempting to avoid metaphorical interpretations. He is certain that the texts deal with descriptions of actual events. Yet, as a reader, you will notice that the Saturnian researchers often invoke metaphors when they are uncertain of the physical events or processes which are being described by ancient texts.

I will insist later in this text that our ancestors were largely incapable of abstract metaphorical expressions until the first millennium BC, except for similes ("A is like B"). Expression of more complicated tropes was absent, despite the obvious fact that new words of any language are developed through metaphorical extensions.

[\[return to text\]](#)

Note 6 --

As I have already pointed out, the reaction to *Worlds in Collision* was absolutely volatile, especially from the scientific community for whom the ideas expressed by Velikovsky countered all the "scientific narratives" that they had grown up with as children and as members of the establishment and had accepted as invariant truths. The following is a recounting of the personal reaction by John Godowski, an engineer.

"I opened the book to somewhere in the middle, read about half a paragraph, and I was stunned, astonished, and violently angered! No book had ever before or since provoked such a violent response from me -- I was furious!"

"Like some warped version of a Greek myth gone literally mad -- written in a scholarly tone no less! With Footnotes! That was even worse! How could anyone with even the intelligence to put a decent sentence together actually stoop so low as to write such a thing? Was he a Crackpot? Out of his mind?"

"Didn't he know about the billions and billions of years and the nebular theory of solar system formation? He couldn't have had an eighth grade education and not known! Therefore he must have known this was Totally False and Impossible before he ever put pen to paper."

-- John Godowski, quoted by Robert Fritzius at www.shadetreephysics.com.

Ten years later Godowski was convinced otherwise.

Alfred de Grazia, in the introduction to the second edition of *The Velikovsky Affair* (1978), wrote:

"Is there nowhere an anti-Velikovsky treatise of serious consequence? The answer, regrettably, is still 'no.' Not in general nor even in a special discipline such as astrophysics or archaeology. Thousands of scientists and scholars have impugned his work. A few have stepped up to bat against him or one of his team: they put on airs; they dance about; they come up unprepared; they take blundering swipes at the ball; they strike out."

In the same book, Livio C. Stecchini wrote:

"In spite of the variety of emotional expressions, the greatest number of reviews written by natural scientists, when reduced to the scientifically significant points, repeat monotonously the same general arguments. They appeal to the 'laws of nature' without any further specifications, and keep iterating the names of Newton and Laplace, as if they were an incantation, without referring to any specific passage or section of their works."

De Grazia further confessed, in *Cosmic Heretics* (1984):

"My own interest in Velikovsky stemmed in part from the hysterical scientific reaction to his ideas -- a reaction unique in this century when books proposing unorthodox ideas swarm, are ignored and sink without a trace."

Note 7 --

Venus was, without a doubt, on an elliptical orbit, and did cross Earth's orbit in an earlier era. Such an orbit can be calculated or estimated. More on this in following text. However, it never came close to Earth. If it had, we would not be here today. "Coming close" is not a condition for an electric interaction. Minor interaction will happen when plasmaspheres graze, at 20 to 30 planet diameters for adjacent passing planets with magnetospheres or atmospheres. Major electrical interactions only happened when plasmaspheres lined up (in line with the Sun). These have happened at distances of 10,000,000 and 20,000,000 miles (16,000,000 and 32,000,000 km).

[\[return to text\]](#)

Note 8 --

Sudden changes in orbital periods can be explained by the electric field force experienced by two planets as their plasmaspheres touch and merge, a very infrequent condition. The seismic disturbances on the crusts are due to repulsive electric impulses. These were experienced at considerable distances (millions of miles for Venus), but were brief, soon replaced by declining attractive force, and followed by electric arcing. More on this in a following chapter.

Planetary orbits are ellipses. Ellipses have two centers, called nodes, defined so that the sum of the lines drawn from the two centers to a point along the orbit always has the same value. One of the centers of an orbit is located at the Sun. The other center is located away from the Sun. The ellipse of the orbit slowly rotates in space, which means that the node located away from the Sun moves in a circle around the Sun. This describes the precession of the orbit (the rotation of the second nodal point). Currently the apsidal precession of the Earth's orbit takes an estimated 112,000 years. (This is to be distinguished from the precession of the equinoxes.)

Most of the changes in planetary orbits are due to the slow rotation of the second node of the elliptical orbits. But changes in ellipticity were also experienced. The change in shape in 685 BC (the astronomical date, corrected for the 4-year error in Eastern Mediterranean chronology) involved a displacement of the Earth's aphelion.

The orbits of two planets will come closer together in time, and then separate again, as the individual orbits precess. The orbits of Earth and Mars are currently (circa AD 2000) aligned to a close approach, although still separated by a minimum of 30,000,000 miles (48,000,000 km). This close approach of Earth to Mars is not expected to happen again for 60,000 years.

As I will make clear later in this text, a "close approach" is not a likely condition for a planetary interaction. It is the alignment of two planets so that their plasmaspheres line up, which results in the destructive electric field interaction between planets.

[\[return to text\]](#)

Note 9 --

"Close approach," as it will turn out as developed in these pages, is 10,000,000 to 20,000,000 miles (16,000,000 to 32,000,000 km). The same long reach of Venus has been implicated in the Spanish Flu epidemic of 1918. The suggestion is that the Sun, Venus, and Earth would have been in line a few months earlier -- with the Moon as an intermediate connection. This can be shown to hold for recent viral epidemics. Thus the suggestion that the 30,000,000-mile (48,000,000-km) tail of Venus could affect the local incubation of insects is not altogether without precedent. For more details on the virus connection see the Appendix "Venus and Epidemics."

Note 11 --

Cardona is probably correct that the Earth could have existed within a plasma discharge (in this case like a "rarefied atmosphere") of a brown dwarf star. The temperature of the plasma might be quite high, but of such low density that it would be equivalent to "outer space." The border conditions of the electric field surrounding the Earth would isolate and protect the Earth's atmosphere from external conditions. Today the Earth exists under exactly the same conditions within the plasma discharge ("atmosphere") of the Sun.

Titan, one of the moons of Saturn (today), and one of the largest moons anywhere (somewhat smaller than Mars), has a nitrogen atmosphere and a cloud cover. It was presumed to have rainfall, for, as reported by the Very Large Telescope (VLT) of the European Southern Observatory (ESO) in 2004, there were possible "huge surface reservoirs of liquid hydrocarbons" under the heavy clouds. The NASA/ESA Cassini spacecraft descended to Titan's surface in early 2005, to find it dry, but with an atmosphere of methane, nitrogen, and carbon dioxide. Titan exists within the discharge of plasma and radiation of Saturn.

Note 12 --

There are Mesopotamian influences in Egypt (bottle seals and other signs of trade) up to

about 3100 or 3000 BC, at least in the Delta region ("Lower Egypt"). But they stop suddenly, and Egypt takes a completely independent course in its subsequent history. Trade may have stopped because of the flooding of the Nile delta and lower Mesopotamia.

Talbott's sources were initially from what is known as *The Book of the Dead* -- a compilation of spells, many of which are descriptive of the acts of the deities involved, mostly from after 2349 BC.

Talbott had been confronted with a confusing set of data in trying to make sense of Egyptian records, for the priesthood of Egypt kept track of every element of all the varied images in the sky viewed over a period of thousands of years, and all elements and symbols were superimposed on each other. This was the result of a democracy of Gods and religious practices among the many separate nomes (the 40 distinct temple districts of Egypt). The numerous variations of spells of the Egyptian *Book of the Dead* parallel this confusion. The welter of details that Talbott managed to extract suggested bizarre and inexplicable physical conditions that were almost unbelievable.

[\[return to text\]](#)

Note 13 --

Jupiter was probably held to be Seth initially, but understood soon as the mummified Saturn in the form of Osiris. Between 3000 BC and 2700 BC it is Mars/Horus who loomed largest in the sky and in religious practices. In the 4th Dynasty, after 2600 BC, when the religious climate changed, Jupiter was recognized as Re, the Midnight Sun.

The first devotions to Osiris do not start until after 2349 BC. With that date the first pyramid texts appear as part of a series of spells which eventually become recognized as the *Book of the Dead*.

The information about Saint Paul is from the literature of the development of Christian theology during the first century AD and is a modern reading. The background for salvation theologies is actually much broader than this and is developed in a later chapter.

[\[return to text\]](#)

Note 15 --

The twisting of Birkeland currents occurs in arc mode and high-level glow mode. There are additional configurations in high-level arc mode, such as the separation into stable patterns of 28 or 56 bundles. When traveling long distances in arc mode, the streams tend to disconnect from the source (because of a voltage drop at the source) and continue to travel with a twisted body, with collapsed ball-shaped ends, and with chalice shaped extensions with a center column (looking like a lily) at both ends. The lily shapes tend to look like three fork tines when seen from the side where the plasma would appear to be denser.

[Image: Full plasmoid bolt. Left illustration by J. Cook. Right image after Dave Talbott and Wallace Thornhill.]

These are known as "plasmoids," and can travel millions of miles. Plasmoids are depicted in sculptures of the gods in antiquity in Europe, Asia, and Mesoamerica.

[\[return to text\]](#)

Note 16 --

See Thomas Gold "Electrical Origin of the Outbursts on Io," *Science*, 206:1071, 1979. The electric nature of the "eruptions" was backed up by Anthony Peratt and A. Dessler in "Filamentation of Volcanic Plumes on the Jovian Satellite Io" (in *Astrophysics and Space Science*, number 144, 1988), although they have a somewhat different take on what specifically is happening with Io, based on the shape of the outbursts. The paper identifies the plumes as plasma, and thus electrical.

Most, if not all, of the published establishment material insists on an interpretation based on an analogy with terrestrial volcanism, despite the fact that every aspect of the expected consensus for volcanic activities is missing.

Note 17 --

For a discussion of interplanetary electric fields and plasma, the exterior negative charge (surface charge) of planets, and the electric characteristics of the Sun, see an article by Ralph Juergens, "Reconciling Celestial Mechanics and Velikovskian Catastrophism," at [\[saturniancosmology.org/juergens.htm\]](http://saturniancosmology.org/juergens.htm), originally presented in *Pensee* (1972). For a more recent general popular discussion, see the essay by James Hogan from his book *Catastrophes, Chaos and Convolutions* (2005) at [\[saturniancosmology.org/jameshogan.html\]](http://saturniancosmology.org/jameshogan.html).

[\[return to text\]](#)

Note 18 --

Thornhill's and Talbott's ideas were expressed at the Kronia Nevada Conference of July 2001. My take on this is that Saturn orbited the Sun, together with Earth and the other planets, for about 1000 years. This ended in 3147 BC.

The whole concept of a "corkscrew" single entry is pure nonsense. Thornhill will attempt to justify the single entry with suggestions of plasma interactions, but plasma *per se* cannot retard the travel of a planet. It would take the force of an electric field interaction, which is beyond the conceptual basis of the Thunderbolts group.

[\[return to text\]](#)

Note 19 --

In the book of Genesis, God separated the waters below from the waters above by creating the dome of the sky. This is the appearance of the northern stars in 4077 BC, when the glow mode coma of Saturn collapses. The "waters above," which had been the plasma outpouring from Saturn to the surrounding space, remain "above" as the rings of Saturn and a stream of water, or what looked like water, connecting to Earth.

[\[return to text\]](#)

Note 20 --

Only Mercury revolves at the Sun's equator, although it also has the most elliptical orbit of any of the planets, doubling its distance from the Sun during each orbit. The remaining planets today have orbits differing by a few degrees from the "ecliptic" -- defined as the plane of the Sun and Earth, and 7 degrees off the Sun's equator. Pluto is off the ecliptic by 17 degrees and on a wildly eccentric orbit. I have never considered Pluto a planet.

I should also add that the "flattening" of orbits may not strictly be required: because gravity represents a spherical field, the flattening of orbits is not due to the gravitational influence of the Sun. It is the minor tugs that larger planets exert on others with each passage which forces a flattening of orbits over an extended period of time.

The location of all the planets to a band extending only a limited amount above and below the Sun's equator is a phenomenon not defined by gravity. It remains undefined. The same inexplicable phenomenon of being grouped at or near the equator is seen in the rotation of nearly all planetary satellites of the planets (and almost all in the same direction), including the satellites of Uranus, which lies on its side with respect to the ecliptic.

In fact, we would expect the planets to circle the Sun much closer to its equator, if that is the rule for travel around a primary, and if they had been in their current positions for 4 billion

years. It would be suggested that they have not been in their current locations all that long, although admittedly their orbits are also separated from each other by absolutely enormous distances, unlike planetary satellites.

[\[return to text\]](#)

Note 21 --

In the next chapter I have made an estimate of 15,000 years for the time it would take Saturn to pass through (entering and exiting again) the plasmasphere of the Sun, which extends (it is estimated) about 100 AU, that is, 9,000,000,000 miles (14,000,000,000 km) from the Sun. This is based on Saturn having an orbital period of 27 million years, and an orbital diameter of 90,000 AU. Paleontologists have estimates 10,000 years for each extinction event, where I have 15,000 years.

[\[return to text\]](#)

Note 22 --

Tom Van Flandern, in *Dark Matter, Missing Planets and New Comets*, allows such a loss of satellites by a body passing close to the Sun. The book is subtitled, *Paradoxes Resolved, Origins Illuminated*, a phrase I have used on my SaturnianCosmology.org business card.

2001 Nevada Conference

On a whim I attended a conference in Laughlin, Nevada, in August of 2001, given by Kronia, the organization with a website (since disappeared) of the same name, organized by David Talbott and others. The conference dealt with aspects of the Saturnian Polar Configuration expanded on in these pages.

I was familiar with the work of Immanuel Velikovsky, and the subsequent work by David Talbott. Velikovsky, in *Worlds in Collision* (1950), described how Venus interacted with Earth in 1492 BC. Talbott, in *The Saturn Myth* (1980), established that, in a more remote era, a large globe had stood above the Earth at the north horizon. Talbott's book is overwhelming in detail, and convincing in its thesis (even though he would interpret some details differently today). The conference also brought out information by Wal Thornhill on plasma in the Universe as I have noted earlier. Others in attendance were Don Scott, Dwardu Cardona, Anthony Peratt, and Rens van der Sluijs.

I came away from the conference unsatisfied. There was no cohesive chronology put forth, and the mechanics of an intersection of Saturn and the Solar System lacked elegance. I decided to start this text (as web pages) in an effort to put things in order and to develop a cohesive chronology. However, initially the lack of an adequate model of the celestial mechanics was an obstacle.

After the conference I wrote up the information I had available (September of 2001) and then the site lingered as I repeatedly got stuck. I backed up to study a few things. I had no problem with the plasma theories (I'm an electrical engineer). What was missing were concepts and data from other disciplines. I needed a broader base to work from, and ended up spending time reading or rereading biology, evolution, geology, and archaeology. I read books supporting orthodoxy as well as books at the edge of speculation.

Problems with the Initial Conditions

By mid-2003, I knew that many of the statements I had made were not supportable and that a new explication was needed. What needed to be reinvestigated was the idea that Saturn, together with Earth, could enter the Solar System in about 3000 BC and end up in a circular path in a matter of 300 years. That just didn't make sense.

I started rewriting in February of 2004, and finished in draft form a year and a month later, March 2005. Now, in the spring of 2014, I see that additions, word edits, and data tweaks have continued for nine more years.

As I have already pointed out in the previous chapter, there are some problems with the "corkscrew entry" hypothesis:

- Objects that enter the Solar System don't start on circular paths; they travel on extremely elliptical paths. The comets bear witness. Circularization will happen eventually, but it might take millions of years.
- Earth needed a tilted axis with respect to its orbit to account for a persistent ice cover at the poles, extending back 30 million years. That would not have been possible if the Earth had been part of the Saturnian System until 3400 BC, under the condition of being an equatorial satellite.
- In fact, it looked as if Earth has experienced seasons for a very long time, at least 200 million years, and therefore Earth, with its tilted axis, had to have rotated about the Sun at least that long. A tilted axis would not be at all likely for Earth as a satellite of Saturn.
- Also, I could not initially imagine how Earth might have ended up suspended below the south pole of Saturn -- especially as an initial condition. Planets "left behind in the wake" is just absurd.

I juggled these problem areas simultaneously, often falling asleep imagining Saturnian orbits and Earth conditions. I'll address the problems below.

A Comet's Path

My first objection was to the suggestion of a 300-year period for Saturn to "corkscrew" into an orbit about the Sun, approaching the Solar System from below the Sun's equator. In Thornhill's model this would have happened with Earth and Mars in tow below the south pole of Saturn. [\[note 1\]](#)

If Saturn were to be introduced into the Solar System, it would be because of the gravitational attraction of the Sun. Saturn would enter on a comet's path, headed straight to the Sun, like all comets, swing tightly around the Sun, and disappear again into the far reaches of space. But Thornhill and Talbott have Saturn entering the Solar System only once. This absurdity violates Newtonian celestial mechanics.

not to scale

[Image: A diagram of how Saturn and its planets might have entered the Solar System. Illustration by J. Cook.]

Last, it would not matter from which direction the Saturnian System first approached the Solar System. Over time, Saturn would have leveled its orbit to the ecliptic due to gravitational interactions with the Sun's planets. This is especially true if, as I will show later, Jupiter was probably located at 0.7 AU, and would have gravitationally changed Saturn's wild orbit whenever Saturn closed in on the Sun. Additionally, the planets Earth and Mars traveling with Saturn as it first approached the Solar System -- 500 million years ago -- would have rotated at the equator of Saturn, as do the planets of the Sun, and as do the satellites of all the planets -- not below the Saturnian south pole.

With Saturn on an orbit which always turned close to the Sun at each approach, a satellite orbiting Saturn would have a good chance of switching orbits and being lost to the Sun, that is, going into a Solar orbit. For Earth this seems to have happened about 200 million years

ago, after the Permian.

At some point on Saturn's swing around the Sun, a satellite of Saturn would come to a virtual standstill -- where the gravitational pull of the Sun could overcome that of Saturn. This would most likely happen when the planet was directly between Saturn and the Sun. The forward motion of the Saturnian System as a whole would carry the planet into an orbit around the Sun. [\[note 2\]](#)

Thus, as my new starting point, I assumed that the Saturnian System intersected with the Solar System at some point in the remote past with a number of planets -- Earth and Mars, at least, and perhaps others -- as satellites on equatorial orbits around Saturn. Some satellites were lost to the Sun, to rotate independently as planets of the Sun. It is likely that this happened over a very long period of time, enough time, in fact, so that Saturnian planets would end up on orbits flattened to the equator of the Sun.

Ice Cover

The Earth has an ice cover near the poles. The ice of Antarctica is estimated to be 30 million years old. Within the Arctic north polar region there is glacial ice in Greenland (but not elsewhere) estimated to date to three million years ago. There has been no other glaciation on Earth since the end of the Permian, 250 million years ago. [\[note 3\]](#)

I initially wanted to account for the ice, following Immanuel Velikovsky's suggestion, with the heat generated by a shifting lithosphere. His suggestion, however, was based on a "close passage" by Venus. Under this imagined condition the lithosphere would be expected to crack, bulge, and split open, and the heat generated would cause evaporation of oceanic water to the point of saturating the atmosphere. The saturated atmosphere would cause endless rains, but somehow limited to Greenland and North America.

This didn't make sense, although Velikovsky's suggestion actually made much more sense than many other theories, as, for example, basing northern glaciation on the fact that it snows constantly at the North Pole (it does not), or invoking Milankovitch's cycles of changing global temperatures (but cold temperatures do not make glaciers), or the long-term changes in the Sun's sun-spot cycle. None of these causes hold up.

I had much less of a problem with Velikovsky's suggestion than with these other theories and I allowed it to stand as a possibility. Perhaps, as he suggested, gravitational forces could wrench the Earth's lithosphere when Saturn came to perihelion with the Sun. But there were some drawbacks to this theory which continued to nag at me. For one thing, polar glacial ice is not frozen rain -- it is compacted snow. Additionally, northern Asia has never been glaciated, even though it is clearly within the Arctic Circle just like Greenland.

Whatever the cause of the glaciation, we can account for its persistence (as opposed to its

deposition) only by having the Earth revolve around the Sun with the polar axis tilted at an angle. At a minimum, you would need a winter season of no sunlight (as we have today) to retain snow and eventually compact it to ice. If Earth had been on an equatorial orbit around Saturn until recently, there would have been no seasons -- since the axis of Saturn and Earth would almost certainly have pointed in the same direction of space, and there would not have been the dark polar winters. The same is true if Earth had been below the south pole of Saturn until 3400 BC. Then the North Pole would have been directly lit by Saturn and would have been warmer than any other part of the planet. This cannot have been the case. The Greenland glacier is 3 million years old. (I'll offer a resolution further below, and discuss glaciation in the next chapter.)

Seasonal Plants

The seasonal plants and even the diurnal habits of nearly all the animals on Earth argue against the Earth having been below the south pole of Saturn up until very recent times (as Thornhill suggested), or having always existed within Saturn's coronal glow discharge envelope where there would be no difference between night and day (as Cardona suggested).

The Earth might have been a satellite of Saturn at one time, but most likely that relationship had ended a long time ago. How long ago? Talbott at one time suggested the Eocene, 50 to 60 mya (million years ago). The Eocene makes some sense. It is the age of the expansion of mammals, the spread of grasses, and the takeover of modern plants -- all seemingly dependent on seasons. It also falls after the K/T boundary -- the "giant meteor impact" in the Yucatan, 63 million years ago, which marked the eventual demise of the dinosaurs and the end of the Cretaceous period. This certainly represents the end of a biological era for Earth.

The earlier plant cover of the Earth (the Carboniferous, 345 to 300 mya) consisted of slow-growing, heavily armored, and hard (siliciferous) plants. Pine trees (gymnosperms), which date from after that era (the Jurassic, 200 to 140 mya), even today take three years to come to seed, and without flowers. A later period (the Cretaceous, 140 to 65 mya) saw the development and spread of fast-growing, soft-bodied, seasonal flowering plants.

Although the end of the Cretaceous, 65 million years ago, might be suggested as a division between two biologically distinct periods, this is not early enough.

Grasses first developed during the Cretaceous era (140 to 65 mya), the first flowering plants (orchids!) date from the yet earlier Jurassic (200 to 140 mya) or Triassic (250 to 200 mya) periods. If we are to look for a time when Earth first joined the Sun's planets, it would have to be earlier yet, perhaps in the period preceding the Triassic, the end of the Permian, 250 million years ago. The end of the Permian is a likely candidate, for this time also saw the largest extinction ever experienced. After the Permian, life on Earth started over. [\[note 4\]](#)

I am suggesting, therefore, that at the end of the Permian, Earth was still orbiting Saturn; the

Earth would have had no seasons, since the Earth's rotational axis would have been parallel to Saturn's axis of rotation. At the time of the Permian extinction, the largest extinction ever, 99 percent of all aquatic species disappeared and 95 percent of land species. This was accompanied with equatorial glaciers. It is this last, plus the extreme (and inexplicable) nature of this extinction which suggests that Earth would still have been on an equatorial orbit with Saturn at the end of the Permian.

period/epoch	start	features
-Quaternary	1 mya	glaciation in Europe and America
-Tertiary		
pliocene	12 mya	modern plants and animals, Rockies
miocene	30 mya	large mammals, Alps, Andes, Himalayas
eocene	65 mya	mammals dominate, primates
		extinction of dinosaurs at 65 mya
-Cretaceous	140 mya	early mammals, flowering plants, grasses
-Jurassic	200 mya	pinos, birds, small mammals
-Triassic	250 mya	dinosaurs, orchids
-Permian	300 mya	first reptiles, end of large trees
-Carboniferous	345 mya	fern trees, pinos, insects, amphibians
-Devonian	405 mya	fish, first land plants
-Silurian	425 mya	corals, scorpions
-Ordovician	500 mya	marine invertebrates
-Cambrian	600 mya	snails, sponges, trilobites
Precambrian	3100 mya	single cell forms, sponges, algae
(creation)	3900 mya	(oldest rocks)

Dates vary; these are from William Matthews, *Fossils* (1962)

Periodic Extinctions

The Permian had produced the forerunners of both dinosaurs and mammals. The close of the Permian is marked by a drying of inland seas, equatorial glaciation, and mountain building (the Appalachians and proto-Rockies).

Current thinking is that the land extinctions of the Permian were caused by massive lava flows which happened in Siberia, accompanied by increased carbon dioxide and methane gases. As the methane oxidized (along with organic material from the lowered inland seas), carbon dioxide increased even further and oxygen levels dropped. But these particulars are not at all certain.

Some seven lifeless layers of sediment (wind-blown sand and dust) follow each other at the end of the Permian. This is today visible in South Africa's Karoo Desert. Today these layers are estimated to span 100,000 years, but this time span is based on guesses at the sedimentation rates. I doubt if all of it extended over more than a period of a few thousand years. The Permian depositions of material and extinctions were perhaps serial but they were rapid. The extinctions at the end of the Permian were not the result of a single, or occasional plasma contact with Saturn, but the result, I would guess, of a nova event.

I think that this happened as Earth was still in orbit around Saturn for in this instance it is certain that the equatorial regions of Earth were hit. Shallow inland seas were vaporized and a dense cloud cover followed which cooled the Earth. The falling snows built glaciers in

Central Africa, India, and equatorial South America. The nova event might have been initiated by a visit of Saturn to the inner Solar System, but could have continued well beyond that. [\[note 5\]](#)

At this point, harking back to the earlier concept (by Velikovsky) of the possible jolting of the Earth in the periodic visits of Saturn to the Sun, I realized that the frequent and periodic extinctions of the Paleozoic (the period since the Cambrian) might be due to more than just geological upheavals.

Robert Bakker has put forward a theory of simple causes for dinosaur extinctions -- changes in climate, the spread of species hostile to others into new territories, the spread of viral or bacterial infections. This suggests that geological changes were not *per se* the cause, although these happened with some regularity. Of course, new territories would open up with the periodic orogeny (mountain building) and the frequent retreats and advances of the inland seas (as in Central North America). But it would seem that these theories also could not explain the periodicity of extinctions -- events which were sudden and wholesale, followed by millions of years where nothing happened. [\[note 6\]](#)

If Saturn's occasional return to the Sun were to have a worldwide impact on the Earth, there had to be some mechanism to account for it, other than possible geological disturbances. Mountain building, or the draining of inland seas, is extremely slow from a biological point of view. Biological organisms will adapt during the millions of years that it takes to raise mountains (if mountain building indeed takes millions of years). What was needed to explain the extinctions was a more sudden cataclysmic event.

Then I realized that massive plasma discharges could have been almost totally responsible for the extinctions. Unlike a comet, however, a tail would not form as Saturn approached the Sun. Instead, because of its enormous size and the extended time spent away from the Sun at the much higher positive electric potential of a star, Saturn would attempt to gather electrons from anything nearby, whether that was Earth still in orbit around Saturn, or Earth in a close orbit around the Sun, or any of the other planets of the Sun. [\[note 7\]](#)

It would not matter if Earth were still a satellite of Saturn, or had become a planet orbiting the Sun. The plasma discharges of Saturn, as it neared perihelion with the Sun, would affect Earth in either case. In fact, the lightning discharges would probably start when Saturn, with Earth as a satellite, initially crossed the boundary of the Sun's plasmasphere (heliopause) at a distance of about 100 AU from the Sun, and would continue until Saturn again exited. During this time Saturn would have blazed through the skies not unlike a comet, but considerably different and much more compact. This assumes, as the reader can see, that I am suggesting a very long period for Saturn.

[Image: Extinctions since the Permian. After NASA, N. Short, rst.gsfc.nasa.gov/Sect18/]

The major difference between the situation of Earth as a satellite of Saturn and Earth as a satellite of the Sun, would be that, if Earth were in orbit around the Sun, the plasma discharges at any time might be of an entirely different magnitude, and thus have an entirely different extinction effect. The effect would also depend on where the plasma struck the face of Earth (land or ocean) and how close Earth was to Saturn as it passed by. As a matter of fact, it is the case that no two extinction events have been alike. Their effect at any one time is completely different from their effect at any other time. The biological extinctions were estimated by Stephan Gould and Niles Eldredge in 1971 at about 27-million-year intervals. [\[note 8\]](#)

The amount of time spent within the plasmasphere of the Sun (where Saturn would have started arcing to other objects), out of a 27,000,000-year period, can be approximated from the ratio of half the circumference of the Sun's plasmasphere and the complete circumference of Saturn's orbit. This calculates to $(2 \cdot \pi \cdot 100 \cdot \text{AU} / 2) / (2 \cdot \pi \cdot 90,000 \cdot \text{AU}) = 0.000555$, one half of one tenth of one percent, representing 15,000 years of the 27,000,000-year period. [\[note 9\]](#)

During any of the later near approaches of Saturn, after the Permian, the Earth would likely have been displaced to a new orbit, depending on how the two planets approached each other. The new orbit would have had a major effect on the climate. In fact, the biological record indicates that Earth experienced extreme changes in climate, in each case lasting tens of millions of years following each extinction event.

These concepts might be the answer to the "Planet X" theory, which suggests that an

unknown planet of very long period caused the mass extinctions of life on Earth at 27,000,000-year intervals since the Cambrian, 560,000,000 years ago. It has been suggested that Planet X would travel at a right angle to the equator of the Sun, that is, circumpolar, since nothing like Planet X has been found in the ecliptic.

Most likely "Planet X" was Saturn, and not on a circumpolar orbit but on or near the ecliptic. The extinctions would be caused by changes in climatic conditions coupled with X-rays, UV radiation, and Gamma rays (high-energy photons) lasting for tens of thousands of years. Plasma discharges would certainly be to blame for the last.

If we recognize the Yucatan Chicxulub impact crater (65 million ya) as an anode burn mark, it serves as an example of the possible destructiveness of an arc mode plasma contact. (There is evidence that massive lightning strikes produce radioactive products. More on this in the chapter, "Tunguska and Chicxulub.") [\[note 10\]](#)

Below the Pole of Saturn

Lastly, as I mentioned, I could not accept the postulate of the Earth located below the south pole of Saturn as an *a priori* condition. Nothing in all our experience with the paths of planets or satellites indicates that this would be remotely possible as an initial condition at any time in the past. Secondaries revolve around their primaries at the equator of the primaries, they do not hang suspended sub-polar. Yet, I would have to accept the sub-polar configuration at least as a required condition at some later time, for all of the Saturn imagery describes this.

The possibility of Earth being recaptured by Saturn as a satellite is virtually nil. Capture requires a forward motion which not only matches the passing planet, but requires passage on the outward side of the capturing planet (away from the Sun), and then a sudden change in direction and dramatic change in speed to become a satellite. If a planet were to meet Saturn equatorially the planet might be moved electrically into a larger or smaller Solar orbit. It would not end up orbiting Saturn as a satellite.

But if Saturn and another planet could override each other, placing one above the other (which could easily happen because the orbits of all the planets are tilted at different angles), this would be an entirely different condition. This would not change the orbits around the Sun of either Saturn or the planet. They would ride the path around the Sun together.

Tom Van Flandern defines a "gravitational sphere of influence" for planets. The "gravitational sphere of influence" is the region surrounding a planet where a potential satellite would remain to travel with the parent planet, if the speed of travel were within a certain range. Otherwise the satellite would either escape or crash to the planet (as Van Flandern has it). For Saturn the "gravitational sphere of influence" would be reduced as Saturn closed in on the Sun on its elliptical orbit.

The gravitational sphere of influence generally has a radius of about 100 planet diameters (thus about 7,000,000 miles for Saturn -- 11,000,000 km), but decreases in size when near another large mass -- like the Sun. The region near the Sun then becomes the most likely location to accidentally pick up a planet which would remain within the sphere of influence of Saturn as the sphere expanded again on leaving the vicinity of the Sun. Van Flandern has pointed out that this represents probably the only location where the capture or loss of a satellite could happen. (The asteroid belt is another location.)

The planet or potential satellite in proximity of Saturn would thus initially travel along with Saturn because it would find itself within the gravitational sphere of influence of Saturn. It might act as a sort of stationary satellite for a period of thousands of years, with each rotation of Saturn around the Sun. But, as Van Flandern has noted, this would not be an altogether stable location,

But the gravitational sphere of influence is a second order effect. The primary effect is a clash of the electric fields of the two planets after their plasmaspheres are breached. The meeting of planetary plasmaspheres can occur under certain conditions, and the results vary. I will describe these as needed in the narrative.

Back to the description of the modifications to Earth's orbit: The described condition would thus leave Earth on the same orbit, but with the orbit perhaps tilted at a different angle. The orbit of the planet would come to coincide with the orbit of Saturn over a period of time. Each additional circuit of the planets around the Sun would continue to slightly modify the smaller planet's orbit. One needs to remember that Earth is the size of a pea in comparison to the pumpkin-size of Saturn. [\[note 11\]](#)

New Postulates

At this point I started to rewrite the web pages. The following were the new postulates and some corollaries:

- Earth, Mars, and Neptune were all planets (satellites) of the star Saturn, and had been orbiting Saturn for billions of years since their creation when, shortly before the Cambrian, 560 million years ago, Saturn intersected with the Solar System -- perhaps for the first time.
- Saturn swept around the Sun like a comet, to return every 26,000,000 or 27,000,000 years, still with the original planets in tow, that is, as equatorial satellites.
- Over time, some of Saturn's planets were captured by the Sun. This happened to Earth after the Permian, 250 million years ago. This could only happen to Saturnian satellites on prograde orbits around Saturn.
- The return of Saturn at 27,000,000-year intervals was responsible for the periodic extinctions which the Earth has experienced since the Cambrian. On traveling through the plasmasphere of the Sun, Saturn would attempt to discharge to any nearby objects, including, of course, Earth. (This would be true whether Earth traveled with Saturn as a satellite, or Earth was already orbiting the Sun.)
- At this point it should be made clear that the ability of Saturn to attract other planets, especially the inner planets, has to be the result of Saturn entering the Solar System with an exceedingly high positive charge. It could also be suggested that Earth may have been captured and released a number of times in the last few million years.
- Over a much longer period of time, extinctions were most likely caused by electric field attractive or repulsive forces which changed the Earth's orbit plus massive electric discharges (arcing) from Saturn, perhaps only as Saturn reached perihelion with the Sun.
- The specificity of the extent of many extinctions can probably be attributed to the different locations of the strike point of the arcing from Saturn (on land, shallow sea, or ocean), and the fact that at different times the contact would have varied with the chance location of Saturn and the position of Earth.
- Saturn may have been responsible for all the speciation after the Cambrian, and

especially the complex species which have developed since that time.

- Speciation probably took place during or after every extinction period, although it might have taken many thousands of years before new species stabilized and would show up in the record.
- The fact that Saturn was never deflected by the Solar System planet Jupiter would be explained by the fact that in 560,000,000 years Saturn would have entered the Solar System only 19 or 20 times.
- Once the period of Saturn was significantly reduced (6 or 3 million years ago) it would have come closer to the Sun more frequently (of which we have both physical and written records), smaller planets of the Sun would then have a greater chance of being captured into a sub-polar or supra-polar orbit by Saturn (the Moon was never captured). In fact, it would be likely that over time all the smaller inner planets would have been captured in this manner. Only planets further away from the Sun would be safe from this because they would be less likely to encounter Saturn.

With the above list as a starting point, I could proceed to visualize the interaction of Saturn and Earth after 10,900 BC, and have some confidence of being on the right path toward a connected narrative. At the same time a 4-billion-year vista of the past suddenly opened up.

I hope the reader will understand that what is presented here is conjecture, although it is supported by a very large measure of common sense and by concepts which have only come into more general awareness in the last decade. Although for the most part we know next to nothing about the specifics, it should now be possible to chart a course of likely events and probable dynamics which matches the sparse information we have. The new element added to the normal planetary dynamics is, of course, the part played by planetary plasmaspheres, electric field forces when these intersect, and the attendant electric discharges.

What I will attempt to do in the following chapters is to plot the progression of changes for the planets of the early Solar System, using the simplest and most likely explanation which makes the case at any point and sets the stage for following events. This removes much of the inexplicable "changes in orbits" for which the catastrophism of Velikovsky has been faulted. I hope to bring the story back to the normal expected interactions between the planets of a star. In fact, most of the events after 3147 BC reduce to a series of small changes in a set of nearly identical orbits of two groups of two planets, Mercury and Mars, and Venus and Earth -- but generally at very long intervals.

In this chapter I have hinted at the 500-million-year long history of the repeated interactions of Saturn with the Solar System. In the next chapters I will show that Saturn probably was the cause of the development of higher life on this planet, and in subsequent chapters tell how our remote ancestors experienced Saturn in the skies above Earth -- and recorded this in the Americas, probably since 41,000 BC.

This information would set the stage for the eventual capture of Earth to below the south pole of Saturn. I will address this period, which started in about 10,900 BC, a few chapters hence.

Looking forward, the following will be discussed more or less in order.

- 10,900 BC - Shock in North America, fire, demise of megafauna, creation of the Great Lakes, 1500 years of shadow, 225-day year. Start of the Peratt plasmoids in the south.
- 8347 BC - End of the period of the plasmoids.
- 5800 BC - Black Sea flood.
- 4077 BC - Saturn lights up.
- 3147 BC - World flood, Jupiter on a steep mountain, 240-day year.
- 3067 BC - 2750 BC - Mars (with Mercury) closes in on Earth 10 times.
- 2860 BC - Jupiter enter the asteroid belt, loses its mountain form.
- 2349 BC, September 8 - Contact by Venus, fall of the Absu, appearance of the Moon, 260-day year.
- 2193 BC - Contact by Venus, 200 years of drought, 273-day year.
- 2150 BC - Jupiter catches on fire.
- 1936 BC - Contacts by Mars, Sodom and Gomorrah destroyed.
- 1492 BC, April 19 - Disturbances by Venus (Typhon), Exodus, 20 years of cloud cover, 360-day year, axial inclination to 30 degrees.
- 1442 BC - The sun stands still for Joshua (Venus).
- 806 BC - 687 BC - Nine Mars contacts.
- 776 BC, February - Mars, Venus, Mercury ballgame.
- 747 BC, February 27 - Mars jars Earth. 365.25-day year.
- 686 BC, March 23 - Mercury jars Earth, second Tower of Babel.
- 685 BC, June 15 - Venus and Mercury (Phaethon) start to blaze.
- 685 BC, July 9 - Jupiter wakes from death.
- 685 BC, July 14 - Jupiter releases a plasmoid bolt.
- 685 BC, July 25 - Plasmoid bolt lands at the Sun.
- 685 BC - Earth's axial inclination changes.
- 684 BC - A new Great Year starts March 8th (old equinox date).
- AD 600 - 800 - Red ring of the Absu fades.
- AD 1700 - Last sprinkling of Absu dust.
- AD 1840 - Ecliptic pathway last seen.

Don't let anyone suggest that the recent history of the Earth has been one of a few simple transitions. It is a miracle that we humans survived at all.

Endnotes

Note 1 --

The single-entry corkscrew idea was reiterated (to me) by the Saturnian people (of Thunderbolts.info) as late as summer of 2007. In the 2007 book by Wallace Thornhill and David Talbott, *The Electric Universe*, there is an illustration of circular and spiraling

magnetic lines, shaped like a funnel, located above (and below) the axis of the Solar System, with the Sun as the main focus (attributed to S. T. Zuess, 1999). The magnetic lines spiral toward the Sun, and are reminiscent of the proposed spiral (corkscrew) path taken by Saturn on approaching the Solar System (from below the Sun). But there the analogy stops. A book illustration is no basis for insisting on a spiral approach path for a planet. This also contradicts well-established gravitational mechanics. Comets elevated above the ecliptic do not spiral into the poles of the Sun.

Dwardu Cardona, in a series of four books (see the Appendix "Book List"), also maintains the thesis of a single entry of Saturn (with Mars and Earth in tow) into the Solar System.

[\[return to text\]](#)

Note 2 --

I am assuming that all of Saturn's satellites also rotated about Saturn in a prograde direction (counter clockwise as seen from above its North Pole), as they do today.

The prograde direction of Saturn's travel around the Sun is probably critical, because a satellite circling Saturn would describe an epicycloidal path in moving around the Sun with Saturn, making it look as if at some point it were standing still. The "stand-still" nodes for this path are located between the passing Saturn and the Sun. And, in fact, at these locations, the satellite would still have the forward speed of Saturn, appropriate for a new orbit around the Sun at that location, but reduced somewhat by the orbital speed of the satellite in the reverse direction around its planet.

If the satellites of Saturn had rotated retrograde, the stand-still nodes would be placed on the outside of the orbit of Saturn. There are of course two additional possibilities, based on an initial orbit of Saturn in a retrograde direction around the Sun.

Today we see very little "flattening" of orbits. This can be blamed on the wide dispersal of the planets, in effect minimizing their gravitational interactions. But as long as Jupiter remained within the realm of the inner planets (before 3147 BC) there would have been much greater gravitational interactions. Thus it is likely that during this earlier period the orbits of the inner planets (plus Neptune) were flattened to the equator of the Sun, or, more likely, to the orbit of Jupiter. This could have extended back 500 million years for some planets.

Note 3 --

Ice cores in Greenland only show a series of about 120 thousand years for the current northern glaciation, however. Antarctic cores from Vostok stopped at 414,000 years ago.

Note 4 --

There is a greater variety (and geographic distribution) of orchids than any other flowering plant -- on the order of 40,000 or 70,000 species. Orchids are found from the Arctic to the tropics.

Grasses grow from the bottom, rather than the top, as other plants do. This is a biological solution to being grazed, just as trees attempted to move away from ground level. Most earlier plants had attempted to protect themselves by being tough and difficult to chew.

Before grasses became well established, before the end of the Cretaceous (and the end of the age of the dinosaurs), when the wind blew dust was everywhere. It is these dust storms which have provided us with the fossils of that era. Sands and volcanic dust have piled up in some areas to depths of thousands of feet. The remains of animals covered in thick layers of wind-blown material cannot be destroyed by scavengers.

After the spread of grasses the sedimentation rate dropped. It is one of the noted differences between the periods before and after the Cretaceous. We have found far fewer fossils from this later era.

Note 5 --

See Peter Douglas Ward, *Gorgon: Paleontology, Obsession, and the Greatest Catastrophe in Earth's History* (2004), which deals with the Permian land extinction of 250 million years ago. This is a personal account of ten years' research for clues to the causes in South Africa's Karoo Desert.

And see also a more recent work by Douglas H. Erwin *Extinction, How Life on Earth Nearly Ended 250 Million Years ago* (2006). Erwin starts out by stating that he does not know the answer. At the end of the book, after reviewing a dozen theories, he still does not know.

Oceanic floor spreading starts at about 180 mya in the Jurassic (started 200 mya).

[\[return to text\]](#)

Note 6 --

Robert Bakker, in *The Dinosaur Heresies* (1986), convincingly suggests dinosaurs were warm blooded, and also writes about the extinction of the dinosaurs, 65 million years ago, stating the rather startling fact that "sedimentation stopped" after this time. This was the time of the takeover of the soil by grasses. Bakker's claim about sedimentation started my search for the point in time between the two differing biologies that the Earth seems to have experienced.

I checked the record of orogeny, at least for the American continent; it looks periodic as well. However, orogeny is more likely to be caused by an expansion of the Earth -- which is a whole different topic altogether. The expansion and the creation of the world's oceans dates from the Jurassic during which time the oldest ocean depressions were formed. See the Appendix "Changing Size of the Earth." The disappearances of the inland seas after the Permian is probably the result of a runoff to the much lower levels of the first true ocean depressions.

Note 7 --

I will assume that all the "lost planets" of Saturn ended up orbiting the Sun at close distances, the location Saturn reached as it swung about the Sun at perihelion -- perhaps something on the order of one-half AU. Mercury today orbits the Sun at 1/3rd AU; Venus orbits at about 2/3rd AU. For Earth an orbit at 1/2 AU would make the climate much warmer, but it would be moderated by the Earth's enclosing atmosphere.

[\[return to text\]](#)

Note 9 --

The extent of the Sun's plasmasphere is estimated at a modest 100 AU.

If Saturn is on a 27-million-year orbital period, then, from Kepler's 3rd law, $T^2 = R^3$, we get (using AUs and years)

$$R^3 = T^2 = 27 * 27 * 10^{12}$$

The cube root of this is 90,000 AU

The formula in the text compares (for the Sun) half the circumference of a circle with a radius equal to 100 AU (which would represent the average size of an arc passing through the plasmasphere of the Sun), with (for Saturn) the circumference of a circle of 90,000-AU radius -- using a circle as an approximation of an elliptical orbit.

$$(2 * \pi * 100 * \text{AU} / 2) / (2 * \pi * 90,000 * \text{AU})$$

Voyager I reached the edge of the Sun's plasmasphere (traveling 100 AU) in 26 years at 40,000 miles per hour (64,000 km/hr) -- more than its escape velocity from Earth (it was

augmented by a swing around another planet).

$$(100 * \text{AU}) / (40000 * 365 * 24) = 26.5 \text{ years}$$

Saturn in its entry into the Solar System would not reach this speed soon. Its average speed along its 27,000,000-year path would be only 220 mph (350 km/hr). It would speed up in closing in on the Sun, but would not reach a speed of 40,000 mph (64,000 km/hr) until it almost reached the orbital distance of Mars from the Sun.

The radius of the orbit of Saturn can be compared to the distance to the nearest star, Proxima Centauri, at 268,000 AU. Thus the (average) orbital diameter of Saturn's orbit is only about 70 percent of the distance to Proxima Centauri: $(2*90) / (268) = 0.69$. Proxima Centauri exists only as a single point in one location, somewhere in the sky. There are, by the way, some 32 stars within a distance of 950,000 AU (15 light years) from the Sun.

It should also be realized that the orbital period is not affected by the eccentricity. And, secondly, that Kepler's third law is based on the long axis of the orbit, so that estimates of how far away from the Solar System Saturn would travel are numerically correct.

[\[return to text\]](#)

Note 10 --

The Chicxulub "impact crater" in the Yucatan (Mexico) is impressively large and circular (112 miles in diameter -- 180 km), but it is not an impact crater. It is surrounded with smaller perforations along the edge typical of any of similar anode burn marks elsewhere, such as the craters of the Moon. These are the cenotes (sinkholes) of the Northern Yucatan. Their circular pattern is clearly seen in satellite images. A gravitational anomaly mapping shows a ridge inside the complete ring of the "crater" which, of course, has led to the suggestion that the crater was formed by the impact of a smaller object only 6 miles in diameter. I'll suggest that the crater was made by a lightning bolt 112 miles in diameter.

The Chicxulub crater marks the boundary between two geological periods, the Cretaceous and Tertiary periods (the start of the Eocene), 65 million years ago, known as the K/T boundary ("K" from the German "Kreide" for Chalk, meaning Cretaceous), which also marks the extinction of the dinosaurs (in the following 10 million years). An Iridium-bearing clay layer separates the two periods. This was first pinpointed worldwide by the team of Luis and Walter Alvarez (1980). Tom Van Flandern writes, about the "K/T boundary":

"Was the K/T boundary event the result of a single asteroid impact (causing the 200-300 km diameter Chicxulub crater in Mexico) or something more? We note the following points as evidence that it was something more:"

"The global set of craters Manson, Karn, Kamensk, Gusev, and another impact in the Pacific Ocean apparently all date from close to the same epoch. However, the diameter and abundance of quartz grains are larger in Western North America than elsewhere in

the world, suggesting that the single largest impact was the Chicxulub event."

- *"The K/T boundary consists of two distinct claystone layers, the upper (soot, iridium) one with shocked grains, the lower one without."*
- *"Gorceixite (altered tektites with swirl patterns) is segregated within each layer, suggesting that different impact events formed these glassy beads."*
- *"A single bolide impact cannot simultaneously explain the pattern of major floral extinctions on land and other extinctions at sea."*
- *"Sediments in Cuba range from 5 to 450 m thick, probably from a giant wave. The (upper) ejecta layer is 50 cm thick in nearby Haiti, far more than at any other site, suggesting a major impact within 1000 km, which would be far from the Chicxulub crater in Mexico."*
- *"The K/T boundary layer is apparently absent from the Antarctic regions. Just as for the Sun, planets spend up to six months continually below the horizon as seen from each polar region alternately. So the boundary event apparently affected the entire globe except for the south polar regions. This pattern suggests multiple impacts from an exogenous source over a period of at least one day."*
- -- [\[metaresearch.org\]](http://metaresearch.org)

This accumulation of data starts to look more and more like a gigantic plasma strike followed by smaller strikes, "over a period of at least one day." By analogy from later and better-known events, I would suggest a period of seconds or minutes. Thunderbolts result in nearly circular "craters"; repulsive electric field impacts take a completely different form, last many minutes, and show the result of the Earth's rotation. Details of the results of a compressive electric force are developed in Chapter 9, "Event of the Younger Dryas," and Appendix B, "The Celestial Mechanics."

[\[return to text\]](#)

Note 11 --

Another likely sequence, which I will develop in the following chapter, is that Earth's connection to Saturn was at a lateral level before dropping below the south pole of Saturn. I estimate that this last process took from circa 10,900 BC to 3147 BC. Moving into the plasmasphere of Saturn, Earth would initially have received a massive electric field shock, followed soon by a thunderbolt from Saturn. It appears that the shock was repulsive, despite the fact that Saturn would be considerably more positive than Earth, which should have resulted in attractive forces.

The shock would account for the cold period of the Younger Dryas between 10,900 BC and 9,000 BC, for the compressive shock would generate very high temperatures, and instantly incinerate forests and prairies. Micro-fine carbon (nanometer particles) would have entered the stratosphere, in effect casting Earth into an extended period of shade.

I'll start the discussion of this in the chapter "Tunguska and Chicxulub." During this

condition (being cast into darkness), Earth would have progressively relocated to further below the pole of Saturn, without any additional disruptive effects.

"A discovery must be, by definition,
at variance with existing knowledge."
-- Albert Szent-Györgyi

The Equatorial Rings

Allow me to interrupt this exciting narrative with some comments on my sources and methods, and, since the thesis of this text goes counter to mainstream scientific dogma, I also have some notes on this. And I'll take this opportunity for an early exposition of the Earth's equatorial rings which lasted partially into the current era. I'll start with the rings.

Corollaries are often suggested from available data rather than being derived from initial postulates. There is generally no problem with this, for our reasoning is frequently after the fact. However, in the ideal case we would start from an initial (*a priori*) postulate and follow this up with a search for data and confirmation of corollaries.

Let me take this opportunity to introduce the Absu as an example of this process, or at least as an example which is still clear in my mind what evidence was brought to bear on the initial postulate and in what order. This is modestly revealing of how a particular idea was confirmed. What follows is also an important concept which informs all of the legends and mythology coming out of antiquity. Without the Absu being understood as a set of obscuring rings in the south sky, almost nothing will make any sense.

I started with the postulate that the Earth might at one time have had equatorial rings. The postulate for the existence of equatorial rings for Earth (which do not exist today), came from the general ideas that (1) all the planets with considerable magnetic fields have rings, (2) rings of particles are probably suspended by electrostatic forces, and (3) the rings of Jupiter and the outer planets seem to be fading, whereas Saturn, which is electrically very active, still has the most noticeable ring structure.

The Earth, thus, would be a good candidate for having had equatorial rings. Earth has a magnetic field, and Earth was electrically active at an earlier time. Perhaps Earth had rings at one time which faded like the rings of other planets seem to be fading. This is already a qualified postulate, incorporating secondary evidence into the original notion.

But now consider the corollaries to the original postulate.

If the rings were seen in antiquity, then a record of this might exist. I had no trouble identifying the Sumerian *Absu*, the Egyptian *Duat*, and the Maya *House of Nine Bushes* as a set of rings seen in the southern night sky. The rings which were called "the Absu" in Sumer, are called the Abyss or "the Deep" in the Bible. The rings were almost universally, throughout the world, understood to be an ocean standing up from the south horizon. [\[note 1\]](#)

Second, if the rings existed, they would most likely have segregated into distinct bands, like ring systems of other planets, which could have been counted. The Sumerian Absu and the Egyptian Duat, seen at 30 degrees north latitude, consisted of "seven seas" (called "mansions" in Egypt as well as in the Bible), while the Maya or Olmec, located at 20 degrees latitude, ten degrees further south than Egypt and Sumer, counted nine rings ("bushes"). In the USA, at Poverty Point, Louisiana, at 33 degrees north latitude, only six rings were recalled in a huge land sculpture.

Third, there are very strong traditions of the sky looking like a sea. It may have very well have been how Saturn's rings looked in the 1980s (when it was electrically more active than today, in the 2000s). A "sea" would be instantly suggested from the wave patterns seen in the rings, despite the fact that this sea was located in the sky. This is especially so because rings at different distances from the Earth would move at rates different from the rotation of the Earth -- some might even move backwards.

It is clear that both Sumer and Egypt described the southern skies (the Absu or the Duat) as a sea, although some Egyptian descriptions have more of the feel of a swamp. In Egypt, the Gods and the dead pharaohs are described as moving by boat across this sea. In Sumer, the God of water was assigned to the sector of the sky below the equatorial. In Egypt, the mountain of Re (the later lower plasma plume of Jupiter) was said to rise out of the waters, and to illuminate the depths of the sea.

Last, the Earth would have cast a shadow across the rings at night, which would have moved from the east at nightfall to the west at dawn. Depending on the angle of the Sun, it would have looked like an obscured arched doorway, and at the equinoxes as a giant gap. I had no trouble locating references to a doorway of the Duat and to the Egyptian name for the door whose name implied that "reeds did not grow there." And it is also clear that the land of the Gods and dead pharaohs was located in the sky in the west -- the direction in which the portal moved each night.

Once the initial "postulate" that Earth had equatorial rings was established as "not unproven,"

it suggested other directions of inquiry. For example, the "flood of Noah" suddenly became clear when measured up against the lack of physical evidence and the statement from China (of about the same date of 2349 BC) that the waters "stood above the mountains." I'll detail these events in following chapters.

The Absu probably existed already long before 3147 BC. The Egyptian word for the rings ("Duat") is very old and was never defined in antiquity (Budge). Seen from the ground at a location in the northern hemisphere, the rings would have filled the southern night sky from east to west in a semicircle standing at an angle less than the complement of the latitude -- about 50 degrees up from the south horizon in Mesopotamia and 60 degrees in the Yucatan. The Egyptians and Sumerians recorded that seven rings could be seen. The Olmecs in Central America, located closer to the equator, noted nine rings. India, at 10 or 20 degrees north latitude, also counted nine rings. The bands (rings) above the equator of the Earth probably reached 8500 miles (14,000 km) high. This is found with the following calculations.

[Image: The angle of view of the Absu. Courtesy of K. Widen.]

Measurements

The angle above the southern horizon that the rings could have been seen can be estimated if some assumptions are made about how far the rings might have extended into space.

The diagram above is composed of two similar right triangles, composed as follows:

Large triangle: legs x , and $y + r$, hypotenuse $r + A + B$

Small triangle: legs {unspecified} and r , hypotenuse $r + A$

There is a region of the rings which is not seen because it falls below the horizon. This can be neglected, since we are interested only in what was seen in the sky, not what was unseen. The following lists how many rings were seen at various latitudes:

- The Yucatan at 20 degrees latitude -- 9 rings;
- Egypt, Memphis at 30 degrees latitude -- 7 rings; and
- Poverty Point, Louisiana, at 33 degrees -- 6 rings (as an archaeological model).

The nine rings seen in the Yucatan probably represent the maximum number of rings, since only the region 256 miles (412 km) above the Earth would fall below the horizon. By analogy with the rings of Saturn, it is unlikely that any rings were closer to Earth.

The angle of view (marked a) to the top of the Absu can be found from segment X and segment Y as the arctangent of Y/X .

The remainder of these calculations is in miles.

As a sample, for an estimate of the height of the Absu ($A + B$) of 20,000 miles, seen from latitude 20 degrees, we can find X and Y as follows:

$$X = (20000 + 4000) * \sin 20 \text{ and}$$

$$Y = (20000 + 4000) * \cos 20 - 4000$$

The results can be found for two latitudes used above (skipping Poverty Point), and for various values of the extent of the rings, as follows:

$$\text{height} = \arctan((14000 * \cos(20) - 4000) / (14000 * \sin(20)))$$

The two additional rings seen at 20 degree latitude, compared to 30 degree latitude, represent a 28.6 percent increase (2/7th) in the number of the rings. As can be seen, a difference of 28 percent between the view at Memphis and in the Yucatan would occur if the rings extended 8500 miles above the equator. There probably were no visible rings close to the atmosphere or stratosphere. The portion of the equatorial below the horizon is 256 miles for the Yucatan

(from $A = 4000 / \sin(90-L) - 4000$).

Comparing Memphis, Egypt (30 degrees), with the Yucatan (20 degrees)			
height of Absu in the sky			
extent of the Absu	30 degrees	20 degrees	add'l view
20,000 mi	54.4 deg	66.1 deg	21.5 %
10,000 mi	49.3 deg	62.4 deg	26.6 %
9000 mi	48.2 deg	61.6 deg	27.8 % <---
8000 mi	46.8 deg	60.6 deg	29.4 % <---
6000 mi	43.0 deg	57.6 deg	34.0 %
4000 mi	36.2 deg	52.1 deg	43.9 %
2000 mi	21.7 deg	38.6 deg	77.9 %

I have included values for 20,000 miles and 10,000 miles in the listing above to demonstrate that even extensive rings will only visually approach the equatorial, they will not be placed beyond the equatorial. This is so because the projection of the equator up into the sky remains below what we would identify as the "equatorial" line on a map of the stars. The equatorial rises to 60 degrees from the south horizon at 30 degrees latitude, and rises to 70 degrees at 20 degrees latitude. The Absu, Duat, and the House of Nine Bushes each remained below this.

Thus the Absu in Mesopotamia (and the Duat in Egypt) rose about 48 degrees above the southern horizon, somewhat more than half way up into the sky. In the Yucatan the "House of Nine Bushes" would have risen 60 degrees into the sky. In both these cases the rings would have partially obscured the ecliptic.

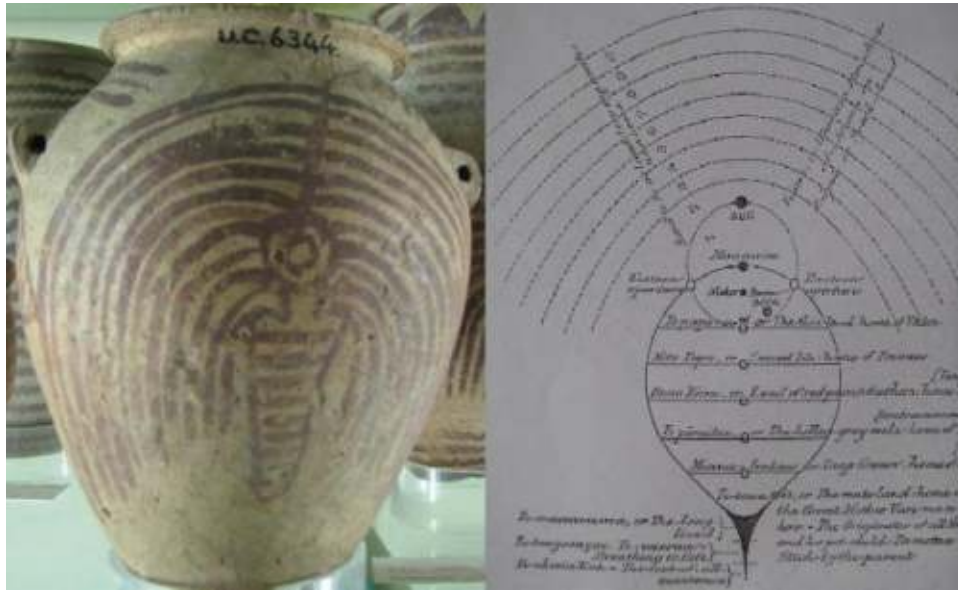

There are Mesopotamian references to 7 streams of the Absu, the same number as in Egypt. India, extending from 30 degrees latitude down to 7 degrees, recorded 9 rings (or streams, rivers, or 7 snakes).

I have neglected Poverty Point (described below) in this comparison, because I am not sure if the concentric berms at Poverty Point would represent the Absu, tempting as this conclusion might be. The six ring structure at Poverty Point may have been constructed a thousand years after the fall of the Absu, and is likely to be a schematic representation of the heavens, since it faces east, the first location of Jupiter when the Earth on its orbit passed Jupiter. The reduction of one ring at Poverty Point from the seven rings of the Duat is, however, consistent with the decrease of two rings between the Yucatan and Memphis.

The *Odyssey*, written in Sicily, assigns six necks and heads to the monster Scylla, who lives in a cave (where else?) very high on a mountain rising out of the "sea." Sicily is at 37.5 degrees north latitude, similar to most of the Greek mainland (or homeland), and also similar to Poverty Point at 33 degrees north latitude where six rings were seen (see further below). See Samuel Butler, in *The Authoress of the Odyssey* (1897), for the very convincing attributions of authorship and location to Nausicaa and Sicily. Robert Graves, in *Homer's Daughter* (1955), comes to the same conclusions.

The count of rings in the "Chilam Balam" is not consistent. It is possible that seven rings

should be counted, based on some references to "the seven seas" (which is Mediterranean terminology).

[Images: Left: Naqada II period Egyptian pot showing 6 or 7 ring areas. Right: A 19th century conceptual diagram of the nine heavens above Earth, plus six Underworld regions, Cook Islands. After M. van der Sluijs.]

It looks as if the number of rings which could be distinguished increases with latitude, as the viewing angle became more obtuse, despite the fact that the rings would be lower in the sky. Thus in Nordic countries and in Tibet, China, and Siberia nine rings are counted. I should add that Hesiod counts nine rivers surrounding the Earth (at 38.35 degrees north latitude).

Rens van der Sluijs offered two additional examples, one being an Egyptian Naqada era pot (3500 -- 3200 BC), and another as a native cosmological diagram recorded by a missionary to the Pacific Cook Islands in the 19th century. The Cook islands are at 20 degrees south latitude, and would afford a view of the Absu as consisting of nine rings, similar to what was seen in Central Mexico at 20 degrees north latitude. However, the Cook Islands were not settled until about AD 300. At the time when the Absu last existed, the inhabitants lived in the Bismarck Archipelago or New Guinea at about 5 to 10 degrees south latitude. (TPOD at www.thunderbolts.info, April 17, 2008)

The fact that the rings do not come together in the east and west in the Cook Island diagram, could be attributed to the fact that the reconstruction was made 4000 years after the Absu fell. But for the Naqada period vase, where the rings are also shown equally spaced from left to right, this is not an explanation. The number of rings of the Naqada pot count to 11 or 12 if the lines demarcate separate rings, but to six or seven if each ring is understood as depicted with two edges. The failure of the rings to come together at the horizon may be because in the Nile valley the horizons directly east and west are obscured by a rise of the landscape.

[Image: Artist rendition of Poverty Point, Louisiana, circa 1350 BC. After Jon L. Gibson.]

In North America, in the state of Louisiana, at Poverty Point (33 degrees north latitude), starting circa 1350 BC, a group of villages constructed an amphitheater as a model of the Absu, consisting of six concentric rings of ridges, broken by five aisles radiating from the center. Poverty Point in Northern Louisiana is three degrees further north than Memphis in Egypt, from which we have the measure of the "seven rings" of the Duat. Thus in Louisiana one fewer of the rings would be seen. The opening of the semicircles faces east, with the center (where a bird mound is located) aligned about 15 degrees north of east, possibly in expectation of the easterly rising of Jupiter. As likely the bird is an image of Mercury, seen flying from east to west after 3067 BC for 300 years, and again after 1936 BC for some extended time. Mercury when passing Earth would have polar plumes facing north and south, looking like wings, and a fairly short tail, depending on the location of the Sun. The absolutely giant size of the bird mound is an indication of how large Mercury might have looked in passing Earth. [\[note 2\]](#)

The rings of material would have obscured the southern stars, and probably became organized into distinct bands and broken up into a pattern resembling waves (as was seen for the rings of the planet Saturn in the 1980s). The nearest bands moved to the east, faster than the rotation of the Earth (which seems to move the night sky to the west). Bands further up from the horizon moved slower. The wave pattern filling the southern sky is the "sweetwater ocean" of the Sumerians and, for the Egyptians, the entry to the "Underworld." [\[note 3\]](#)

Each night the shadow of the Earth would sweep across the rings from east to west. In effect a portion of the rings would not be seen, leaving only the left and right (and top) edges. The effect looked like a portal or gate. This became the gateway to the "other world" of the Egyptians, located in the western sky -- the direction in which the doorway rotated each night. [\[note 4\]](#)

Near the equinoxes the Earth's shadow on the Absu would extend all the way across the Absu from bottom to top. Because at this time the penumbra, the widening soft shadow of Earth, also fell on the Absu, the shadowed area would be shaped like an inverted trapezoid, wider at the top. In Mesoamerica the ballcourt, constructed between two sloping walls, is a physical representation of the south sky at night seen at the equinoxes. In Egypt, at the time of the New Kingdom, the God Re (as Jupiter) is almost always depicted as a giant red globe located in a mountain saddle -- a valley between two mountains composed of ridges and grown with reeds. Graphically this also describes the Egyptian "field of rushes." The massive pylons used as the gates to later Egyptian temples are probably meant to represent the left and right edges of the Duat defining where the shadow of the Earth did not fall.

In Akkadian times (after 2335 BC), in Mesopotamia, the name for the village of Babylon is misunderstood by the invading Akkadians as "The Gate of the Gods" -- that is, the doorway through the Absu. Subsequently, Babylon becomes the most important ceremonial center in all of the lands of Akkad and Sumer, a position held for 2000 years.

I have presented this information on the Absu (more will follow) because it is an important concept. Once the reader knows of the Absu, many statements and descriptions from remote antiquity, which have reference to an ocean, a sea, a number of rivers, or a seven-headed snake, all of a sudden take on meaning and start to make sense. The concept of an ocean in the south skies remained even long after the Absu disappeared.

The rings disappeared, rained down upon Earth and drifted out to space, after 2349 BC, in what would later be known as the "flood of Noah," with the last and most distant ring remaining, I suspect, to perhaps AD 600. More on this in a following chapter.

Three Volcanoes on a Rock

The image below was published in *Newsweek Magazine* in the mid-1980s. It became a starting point for inquiry for me. It is an image taken by the European satellite Giotto of the comet Halley. As originally presented, the image was colored orange -- as if to suggest that the "ice subliming into water vapor" from the comet was lit by a late afternoon Sun.

[Image: The comet Halley spewing forth matter in UV and X-rays from three "volcanoes" on the nine-mile-long rock (14 km). The arcs point almost directly at the Sun. After Newsweek.]

It was this image which convinced me to stop believing in official presentations. It was noted at the time that the three "volcanoes" of the nine-mile-long rock were producing X-rays and ultra-violet radiation (measured at several thousand degrees Centigrade) in the process of subliming water. However, no further mention was ever made of this. There was something awry with this presentation.

The traditional explanation is that comets consist of ice, which moves water vapor out into the space surrounding the comet as the ice is heated on approaching the Sun. It occurred to me that the subliming of ice, at the temperature of deep space and at some 100,000,000 miles (160,000,000 km) from the Sun (as far as the Earth is from the Sun), would not hurtle water molecules 12 million miles into space, much less produce X-rays or ultra-violet radiation, representing a temperature of several thousand degrees. On Earth, subliming ice wafts into the air, producing a hovering fog. In a vacuum something similar would happen. But what we were seeing were "jets" of matter, at times attached in the wrong location to comets, being expelled in the wrong direction.

Comets are rocks, like asteroids and meteors -- they are not snowballs. As the comet Halley moved closer to the Sun from the far reaches of space, the major change in its environment

was the ever-increasing electric field of the Sun. Halley, initially at a much lower electric potential (higher negative), had to make adjustments. The coma and the tail are a cloud of excited electrons (and sputtered ionized silicates also), a plasma in glow mode. The plasma forms an outer sheath of lower negative charge, seen as the coma and the tube of the tail, which in effect isolates the comet, which carries a much higher negative charge (a lesser positive voltage), from conditions of the Sun's electric field immediately outside the coma and tail. [\[note 5\]](#)

The coma is maintained by supplying electrons from the disassociation -- the electric breakdown -- of rock inside the coma. Thus within the coma a charge equalization also takes place between the exterior coma sheath and the solid physical object (called the nucleus) of the comet, resulting in an electric current impinging on the rocky core. At the surface of Halley the extreme electric stresses produced three localized spots where the current flow of the plasma was concentrated to arc mode. These were not three volcanoes fed by a heated interior. Halley has been seen as a comet repeatedly since remote antiquity -- at least since Roman times. The whole of the interior would certainly have been expelled by the "volcanoes" by now. What was happening instead is that the rock of the outside surface was being broken down atomically to yield electrons, with the ground-up rock released as positively charged (ionized) fragments and repelled.

If comets are understood as balls of snow or ice, the radiation of ultra-violet and X-rays is completely inexplicable. But radiation is certainly expected when produced by electric arcing. The "water vapor" detected in the tail is actually (and admitted to be) Oxygen radicals, not produced by subliming water, but by the electric decomposition of rocky silica compounds into ionized Oxygen, Silicon, and Helium. The electric field of the comet propels the positive ions into space.

Sources

My method in developing these pages has been varied. First, much of the information has been accumulated over a lifetime and so, in a manner of speaking, I had the facts on hand. Secondly, although most of the time I just had to plod through texts -- checking dates, names, and other details -- quite a few times the story simply jumped to mind. On hindsight the narrative is all too obvious. Of course, backing up these insights frequently took weeks and many rewrites.

I started from four primary sources. The first of these was Immanuel Velikovsky's book, *Worlds in Collision* (1950), which related a close approach to Earth by Venus at the time of the Israelite Exodus, in 1492 BC, and a number of destructive passes by Mars in the 8th and 7th century BC. The information is almost entirely from literary sources rather than physical data (although well established for Mars), but it is quite convincing, even though some of the source data is applied to the wrong events or the wrong era, and Venus never came close to Earth.

The second was David Talbott's book, *The Saturn Myth* (1980). Talbott's search among Egyptian and Mesopotamian sources established the image of a large globe, identified as Saturn, standing above the Earth at the north horizon in remote antiquity. Many other researchers have followed up on his initial ideas and augmented the information. A number of physical models have been suggested, of which only one made sense, as proposed by Wallace Thornhill -- the combination of a stack of planets, planetary electric fields, and plasma interactions.

My third source was Thornhill's insistence on the electric nature of planets (and the Sun) and the electric interactions in the form of plasma streams -- presented at a conference in Nevada in 2001. There is no definitive text on plasma at interplanetary levels. (Although Talbott and Thornhill have now written two books on the topic; see below.) But plasma has been part of physics and electrical studies for 150 years. I have played with plasma devices since high school. [\[note 6\]](#)

The fourth source has been Julian Jaynes's book *The Origin of Consciousness in the Breakdown of the Bicameral Mind* (1976). Jaynes makes the claim that subjective consciousness did not become part of human culture (at least, in the Near East) until the first millennium BC. The overwhelming concern of our ancestors with the gods in earlier antiquity was suddenly explained. Additionally, the book is a gem of insight into how we think. Jaynes's book is independent of any of the above.

Taken together these sources present a picture of antiquity which does not match the traditional histories entertained today. As I mentioned earlier, there is an amazing collection of information in agreement with the postulates of the cosmology presented here, which in turn strongly confers validity. This cosmology suggests sensible answers to questions which remain unanswered by the traditional "handed-down wisdom" usually presented as the history of mankind, the Earth, the Solar System, and the Universe.

Speculation

I have been accused (rightfully so) of speculation. *Mea culpa*: everything in this field is speculative. Even all of the "Electric Universe Forum" (who did the accusing) is completely speculative. But I might point out, that with "mere speculation" I have in only a few years managed to come up with a reliable and detailed chronology, the dynamics of planetary interactions, step-by-step descriptions of catastrophic events, an elucidation of symbols, the effects on culture, philosophy, and religion, and an extension into the Paleolithic and the Precambrian. All from information which is readily available.

All of the "science" of geology or astronomy are speculation also. Speculation at least implies the guessing after causal connections among facts. The facts are not in dispute. The objection was to my mediation of them and the conjectures I might have arrived at, as opposed to what *they* might have derived. True, even to me the narrative proposed here often

looks like science fiction, complete with unbelievable portents in the skies and dire psychological effects on humans. And it has taken relentless imaginings of the dynamics and the chronology. But the results, as Rens vd Sluijs proposes as the requirements of an adequate theory (meaning "model"), are both "most convincing" and "complete." The narrative I have developed on these pages is certainly well-founded speculation. Everything fits, although the 3000-year history is as complex as an O'Henry novel. What I *have not done* is to start from an *a priori* assumption that there was only one event -- an important distinction.

I should warn the readers, that the Thunderbolts people (Thunderbolts.info) consider *their* thesis -- based on a single celestial event of circa 3200 BC -- as consisting of "the highest confidence levels and the least amount of conjecture" (vd Sluijs). Their thesis is the demise of the "polar configuration" of planets (a form which I also support, with modifications), in about 3200 BC. And nothing more, only the destruction of this "polar configuration."

The "polar configuration" of Saturn was first developed in the mid-seventies, and codified with the book *The Saturn Myth* by Talbott in 1980. It is promoted and expanded upon at the website Thunderbolts.info. But except for the addition of plasma to the mechanics of this, no advances have been made since 1975. The Thunderbolts group has organized conferences, written glossy books, and produced splendid videos. But all of it seems based on promises of something better to come, and hints at a complete picture at a later date. Yet, in nearly 40 years, nothing further has come forward beyond the original "Polar Configuration" and the obvious conclusion that it must have come to an end at some time in the remote past. Examples of their point of view follow:

Ev Cochrane, in "Beyond Bauer" in *Aeon* (1991), wrote:

"... it should be noted that the upshot of the researches of Talbott and Cardona has been a marked tendency to shift the emphasis away from alleged catastrophes in the 15th and 8th/7th centuries BCE to cataclysmic events of earlier, prehistoric times." [\[note 7\]](#)

And with that the complete content of Immanuel Velikovsky's book *Worlds in Collision* is dismissed.

Cardona asks, in "Velikovsky's Martian Catastrophes" (*Aeon* 1990):

"Where, I ask, is there one unequivocal mention of a Mars looming large in the sky anywhere in the literature of the period?"

Cardona has in mind the writings of the Hebrew prophets, and perhaps the archives of the Assyrian kings. But where does a statement like this come from? There must be hundreds of references to Mars under dozens of names. What is mostly missing from the record was the ability or the felt need for the remaining population, 2 percent of the people alive in 800 BC, to create these records.

Cardona at this time was also not aware of the Maya *Chilam Balam* which states, in no uncertain terms, and for the period starting in 747 BC, "Then it was that the word of Bolon Dzacab [Mars] descended to the tip of his tongue." Any archaeologist of Mesoamerica will tell you that Bolon Dzacab is Mars.

What is the "tip of his tongue?" It is the plasma extension of dust below Mars, first noted in the Egyptian "Eye of Ra" (the "Wedjat"), and shown in the much later giant Aztec calendar wheel as an actual tongue of Mars.

Also lacking is a logical series of events at the close of the Age of the Gods and after. The only end to the polar configuration is the claim by the Thunderbolts group of a catastrophe of unimaginable magnitude involving Chaos Hordes and Dragons -- a "heaven-altering 'Doomsday' catastrophe," which, however, never happened. It is, in fact, an ending concocted from much later events and evidence. Only a worldwide flood happened -- in fact, this was the actual flood of Noah.

Complaining in frustration of what he called "the mediocrity, the shallowness, the amateur sophistry, and the nauseating bluff of the neovelikovskian dilettantes," Roger Ashton once likened it as, "a little bit of this, a little bit of that, all aimed at a picture of earnest and revolutionary scholarly enterprise, but leading absolutely nowhere." [\[note 8\]](#)

[Image: Calendar stone of the Aztecs; after Wikipedia.]

I'll be more charitable and suggest instead that the Thunderbolts group knows something was going on, but they can't quite explain it, can't get at the core, do not understand the impact that the "unknown something" has had, yet they continue to promote the ideas, hoping for clarification and resolution in their lifetime. A look at their past publications shows the enormous intellectual efforts that have gone into deriving a workable model of the past. An absolutely astounding effort, with no viable results.

Some of the Saturn Theory of Talbott may be just dead wrong (as my reconstruction might also be). I believe that something went wrong with the out-of-hand dismissal of Velikovsky. The reasoning may have been based on problems with Velikovsky's suggestion of a "close encounter" with Venus -- for the world would have been destroyed. But when I started to look at this, I could not get Earth and Venus closer than about 10,000,000 miles (16,000,000 km). That solved a lot of problems; but that distance did not preclude an astounding electric field interaction. But to conceive of this and understand it, required the application of electric field theory. At least, I have a degree in Electrical Engineering, and have no problem with that.

Alfred de Grazia in *The Burning of Troy* (1984) wrote:

"I would call your attention also to the work of an engineer who has occupied himself with electrical phenomena, Ralph Juergens. Mr. Juergens, working alone and without support other than that provided by the inspiration and encouragement of a few friends, has written articles that I am convinced will be numbered among the most important of our age. The thesis which he advances, and which is my candidate for the winning side in the approaching cosmic debate, is that electrical forces of almost unbelievable magnitude were exercised upon the Moon, Mars, Earth and other heavenly bodies in the recent past."

Let me call your attention to the phrase "forces of almost unbelievable magnitude."

Of the core group of Thunderbolts, Juergens had an engineering background, and could think and imagine what could happen within the realm of plasma physics and Earth-sized globes (and larger) located in the domain of the Sun. That capability is today held by Scott and Thornhill, neither one of which is to be neglected in their writings. But the rest are often clueless when it comes to plasma; they tend to wave plasma around like so much New-Year party confetti.

Anyway, the difficulty with Velikovsky and Venus was such that absolutely everything Velikovsky had come up with was summarily moved to the end of the "Era of the Gods" -- to 3200 BC. And so the raging goddess or dragon of 2349 BC, and the sky filled with blood, was incorporated into the demise of the polar configuration of circa 3200 BC. The Exodus (of 1492 BC) was held to be only a retelling of the earlier cataclysm.

The destruction of more than 1000 cities throughout Central Asia, Persia, the Middle East, Greece, and Italy during the 8th century is neglected by the Thunderbolts group and assigned to earthquakes and marauding Assyrians, as mainstream archaeology also does. Nothing is made by the Thunderbolts.info group of the parallel destructions in Mexico and the Southern United States -- in the 8th century BC almost all of the established farming communities in Veracruz and the Valley of Mexico disappeared. It is a parallel to what happened in the Mediterranean, where 98 percent of the population disappeared between 800 BC and 700 BC.

In actuality, and as I have it, the Exodus story as recorded by Moses was largely a retelling of the event of 2349 BC, an incident never sounded by Velikovsky or David Talbott's group except in equating it to the onslaught of a dragon. And thus Talbot moved the attacking dragon, the three days of blood in the sky, and the new midnight Sun to 3200 BC. This was soon followed by Talbot moving the Bull of Heaven, the traveling mountain of the "Sun," the polar plumes, the gates of heaven, the rings of the south, the seven cows, the star in the crescent (from the 7th century BC no less), and any number of other celestial phenomena all also to 3200 BC.

No one seems to have ever asked the question, What happened to each of the planets when the "Polar Configuration" came apart? What caused the breakup? This has remained unanswered for 40 years now. Yet it took me only a few days to trace out what happened in 3147 BC from available data, although it took months to write it all up.

I should point out also that the ideas promoted by Velikovsky had assumed the status of dogma. These included three outstanding fallacies which have endlessly delayed reasonable analysis:

- the concept that Venus exploded out of Jupiter,
- the concept that Venus left its orbit, and
- the concept that Venus came close to Earth.

Speculation or not, the difference -- the reason I have been able to put together a cohesive and valid narrative in a very short time -- is all in my looser requirements but mainly in my adherence to common sense. I have not based efforts on the pronouncements of a guru.

In my reconstruction cataclysmic events have come forward independently, and were confirmed and explicated one by one. I would also attribute much success to a determination to first create a likely chronology and postulate likely celestial dynamics. Once settled on (even as these two were corrected and augmented many times), they became the touchstones to test the available mythological information against.

Additionally I also have had the distinct advantage of starting very late with this, so that almost all of the information was already available, although I found it uncollated and frequently reductively disassembled. And I cannot forget the endless expansion of the

Internet during this period as a source. That was a relief from the initial task of acquiring background information from library books. I can now find a single word in Homer's *Iliad* in a fraction of a second, rather than paging through the text. And I no longer need to initiate an inter-library loan to look at de Santillana and von Dechend's *Hamlet's Mill* -- it is now online.

The development of a chronology based on the Sumerian *King List* has been the key to unraveling the oldest mythology. That, plus a long time-sequence of Venus figurines over the period of the Upper Paleolithic and the early Neolithic. I was lucky in that respect. As the chronology and mechanics of celestial events solidified over the years, additional facets of mythological and historical obscurities simply started to fall into place. Speculation bore fruit.

I have also spent an inordinate amount of time thinking about the subject, a luxury which other researchers may not have had, which has allowed the evaluation of many alternatives, some of which only slowly took shape. I can imagine orbits, I can imagine the view from Earth, and I can do geometry and make some calculations. And I have consistently attempted to put myself in the frame of mind of the people who experienced the events in the past. Lastly, I have been allowed to constantly rewrite, augment, and alter this text, since it is presented as a mutable Internet document. I therefore have never backed myself into a corner because of what I might have published earlier.

I have degrees in Electrical Engineering, Industrial Engineering, and a Masters in Fine Art. Electrical Engineering study involves an inordinate amount of math and more particle physics than physics majors receive. I remember almost nothing of this, but always know where to look things up, and can recognize what others are doing with physics or math. I understand and can visualize plasma. The MFA background prepared me to consider conceptual aspects of the physical world. I have published probably 70 or 80 essays in art criticism.

I have not departed from the original Saturn "theory" as much as I have extended it. The original Saturn Theory of 1980 was monolithic, and still is today. The approach was known as "neovelikovskian" -- a philosophy meant to replace all of Velikovsky's findings with a single earlier event. The notion of a single cause, a single event, the idea that only one thing happened, and that all the resulting mythology and symbols sprang from this event, is a fallback position, an admission that nothing is really known about the events behind the mythology or about the event that concluded it. The first question on reaching this nexus should have been, "And then what happened?" The disposition of planets after the end of the "Age of the Gods" was never considered.

As a result, the Thunderbolts people have been working from a "story core" model which severely limits what can be imagined. In 2008 Talbott wrote, "*Ra, in his original character, is the primeval Sun and Horus is the warrior-king,*" reiterating a reading which has stood for 40 years. And there is the Princess, the Mother Goddess, the First King, etc. I really think that this morality-play idiom ought to be dropped, since it is so deeply imbedded in Western

culture, Christian philosophy, and the Indo-European language as to be useless in the analysis of how people of differing cultures, differing philosophies, and differing languages would have understood the celestial images. What immediately comes to mind is the mythology of Mesoamerica, where there are no Goddesses (the Moon excepted, and she is a hag), no First Kings, and no Warrior Heroes -- only two clever boys with their blowguns.

Affirming the Consequent

I need to explain also how I managed to get so much detail of events, how I determined dates down to the seasonal, how I managed to pinpoint events in the catastrophic history of the Earth which have eluded other researchers, and how I have been able to clear up enigmas and mysteries which have stood in some cases since antiquity. I especially need to explain this to those to whom, by their admission, I am an embarrassment. Someone wrote of me:

"[we] feel uncomfortable about the way you blend our findings with your own thoughts and speculations. You appear with a website that claims to fill in all the gaps."

Absolutely right. This website came out of nowhere, written in basic outline in a year and a half between summer of 2003 and spring of 2005, with further editorial expansion lasting through 2010. And it does "fill in all the gaps" which I assume are recognized to exist by the writer above. I received the following critique, which sounding very much like an insulted mainstream uniformitarian, flailing wildly at a heretical catastrophist:

"Practically every sentence ... contains one or more errors of fact, citing out of context, misunderstanding sources, and so on."

And so on. There is more, but not worth quoting. But let me propose how I filled in all the gaps.

"It is an elementary logical error (known as 'the fallacy of affirming the consequent') to argue backward from the truth of the conclusion to the truth of the premises."

-- Wesley Salmon, *Scientific American*, May 1973.

This method is otherwise known as "abduction." It is illegitimate from the standpoint of classical logic, since conclusions are derived from results, rather than the other way around. But it is exactly the method used in mythological research -- as well as geology and astronomy. Thornhill at one time wrote:

"At the heart of geology and planetary studies is a reasoning process called abduction. It is a form of logic whose major premise is certain and minor premise is probable."

It is a haphazard process at best, but it is also exactly the method used by Talbott in arriving at the content of *The Saturn Myth*: an amazing and unequalled "abductive" leap.

You gather representative data, then look for a theory. Abduction has legitimacy especially in probabilistic approaches to problem solving; it includes, of course, the evaluation of what would be most likely, perhaps requiring an imagination which correctly points up various visual phenomena, and the ability of setting yourself into the mind and eyes of humans of

antiquity, even to the point of selecting various points of view from terrestrial locations. There could be thousands of instances of reported observations, but, as Michael Kaplan and Ellen Kaplan observe in *Chances Are* (2006), *"but observation, however diligent, is not the same as understanding the forces that generate phenomena."*

Kaplan and Kaplan are talking about weather data (which is considerably more uncertain than the "it most likely is" used here). But the magic of "understanding the forces of generation" applies, for example, to instances of any recorded data from antiquity, found by the *"hundreds, possibly thousands, all painstakingly accrued from a minute inspection of primary sources, spanning millennia in age and across a spectrum of different languages"* -- as reported to me by one avid Thunderbolts group researcher.

But what do you do with all this data? To suggest even one possible cause -- a hypothesis -- is, in fact, the only resolution to providing parentage to all these orphaned data. If one data point can be assigned to a cause, and another, and more yet, then there is no need for a collection of hundreds or thousands. And in this process I have never been wrong. The date of Exodus might have been 1495 BC instead of 1492 BC; what Isaiah had to say might have been recorded a hundred years later (and probably was); the plasmoid from Jupiter might have been 10 million miles (16,000,000 km) long rather than 15 million miles (24,000,000 km). But the outline of the overall narrative, and the intent of the facts used to support this, remains the same.

History

The center post of the house of the Saturnian Polar Configuration was the existence of a plasma column extending from Saturn via "Venus" and Mars to the north polar region of Earth. This had been the supposition since 1980, and it is also more or less the physical model on which I built my exposition, although I moved the contact point to the magnetic pole instead. Anthony Peratt (an electrical engineer) joined forces with the Thunderbolts group in the year 2000. The Thunderbolts people were elated, as evidenced by their enthusiasm in the online newsletter *Thoth*, volume 5 (1991), at [\[othergroup.net/thoth/thothv04.txt\]](http://othergroup.net/thoth/thothv04.txt), for Peratt could explain much of the imagery which the Thunderbolts group had already collected. To quote from *Thoth*:

Then came one of the great surprises in the history of the research. It occurred only last September, when Tony Peratt, one of the world's most accomplished plasma theorists, described the violent evolution of a plasma discharge form that he had documented over more than two decades. In plasma science this configuration is named after Tony -- it is called the "Peratt Instability." From the moment of this revelation, nothing has been the same. The correspondence between the global pictographic record, our reconstruction based on historical testimony, and the extraordinary forms of the evolving discharge in the laboratory is simply "too specific and too precise to be due to accident."

Anthony Peratt published his first findings on petroglyphs in December 2003, in a paper titled "Characteristics for the Occurrence of a High-Current, Z-Pinch Aurora as Recorded in Antiquity" (*IEEE Transactions on Plasma Science*). In his acknowledgements, Peratt thanked A. Acheson, M. Acheson, D. Cardona, E. Cochrane, A. de Grazia, B. G. Low, C. J. Ransom, D. Scott, D. Talbott, W. Thornhill, H. Tresman, I. Tresman, and M. A. van der Sluijs, all people associated with the Thunderbolts group. It is evident that Peratt worked closely with them. [\[note 9\]](#)

For his second paper on petroglyphs, published in August 2007, the same people are listed. Meanwhile, Peratt had co-authored other papers with vd Sluijs and Scott. Peratt's second paper explains in print what must have been known even before the first paper was published, that the "gigantic auroral plasma column," now known as the "Peratt Column," was seen in the south, not in the north.

This must have been a bitter disappointment and major setback for those who had built their whole theory on a northern polar column. A giant of science had been engaged to help carry the logs, but now he had dug a hole which buried the column, center post to the house of Saturn, and flattened the boys when the house blew up. Progressively, from about 2004 or 2006 on, the Thunderbolts related websites started removing the previous reconstructed history of antiquity. Such are the pitfalls of speculation. [\[note 10\]](#)

Peratt's second paper prescribed a date for the south polar column of "about 10,000 BC to 2000 BC" (one date of 5000 BC is listed). I was able to quickly integrate the "Peratt Column" into the archaeology of the remote past, initially finding numerous Mesoamerican references, followed by curious Babylonian and European imagery. Japan and China followed soon after. At some point I just stopped collecting references from antiquity to the "Peratt Column" and the three southern ball plasmoids. From Mesoamerican sources it was relatively easy to find the closing date of the first "Peratt Column" as 3847 BC (in solar years). From this it is apparent that the three plasmoids first showed in 10,900 BC -- the same year that North America was devastated with a repulsive electric field force.

Both the number of entities seen and the number of times the "Peratt Column" showed up in the south sky, mentioned by Peratt, is verified by Mesoamerican, Indian (Vedic), and Chinese sources, and indirectly by the *Popol Vuh*.

The causeways at Carnac point up that the electron beams of the "Peratt Column," which traveled past the Earth (on all sides), connected to another circular entity in the north. The *Popol Vuh* makes the same point: there were two sets of Gods, three in the south, five in the north. See the chapters "The Peratt Column" and "The Popol Vuh." After having been seen three times over a period of 2500 years, 10,900 to 8347 BC (or perhaps as late as 4077 BC), as lines to some objects in the far south, the "Peratt Column" disappeared along with the terminal ball plasmoids, to be replaced by a stream from a globe in the north. At that point, Saturn was still in glow mode, the enclosing shroud of its coma.

The closing date for this period was initially from an analysis of the Sumerian *King List* (see Appendix A), and can be verified partially from climatic data. I should point out also that Adam of the Bible, who is Saturn, lived 930 years. Subtracting 930 solar years from 3147 BC, which saw the demise of Saturn, a date of 4077 BC is reached -- this is the birth of Adam and the date when Saturn flared up.

I estimate the end of this first period (the "first creation") as 8347 BC, a date derived from the *Chilam Balam* statement about the end of the "first creation" -- 13 Katuns before 3147 BC. The "event" which initiated this count of solar years for the Olmecs would have been the appearance of the brilliant southern ball plasmoids of the "Peratt Column." The form was called "the turtle," and also identified as "the three hearthstones." These would not have been seen unless Earth had already dropped into the lower coma of Saturn.

Additionally, there are two inscriptions that use the Tzolkin and Haab day names corresponding for the year 8347 BC, although this was the end of the first period of the appearance of the ball plasmoids, not the start.

I estimate Saturn lit up (went nova) in 4077 BC and established a plasma connection with Earth. For many nations of the Earth, it is this last date which constituted creation, for the "Sun" suddenly appeared.

There will be an urge for the Thunderbolts group to move their polar column and standing sphere to the south -- or to ignore and invalidate it. But Peratt had elucidated nothing with respect to Mars or Venus, and, in fact, these entities never show up among the 4,000,000 petroglyphs which were collected. They do show up in later physical models -- the henges of Northwestern Europe -- and as petroglyphs which the Saturnians have identified as representing Saturn standing above the north horizon.

Peratt had suggested a "massive aurora" as a shorthand simile for the phenomena, since as a scientist he is not allowed to suggest a planet standing above the Earth's North Pole. Some researchers missed the use of the word "like" and followed up on an urge to identify the polar column with an aurora, despite the fact that an aurora does not assume the shape of a column, and that an aurora moves its curtain south toward the equator with an increase in strength. This also has nothing of the look of lines of electrons in arc mode traveling past the Earth.

[\[note 11\]](#)

I will, of course, expand on all this, and explain it piece by piece over the next few chapters.

Endnotes

Note 1 --

The Mesoamerican illusive site of the "city of reeds" -- Tula, Tulan, or Tollan -- is, without a doubt, a recollection of the rings seen in the south. In Mesoamerica the rings were described as bushes; in Egypt the rings were similarly described as reeds.

[\[return to text\]](#)

Note 2 --

The existence of the Duat also explains the Egyptian phrase of "the Nine Bows." The "Nine Bows" have been used in Egyptian inscriptions as a shorthand for all the enemies of Egypt, that is, the people of foreign lands, but in particular with reference to Nubia. Egypt extended geographically from 30 degrees north latitude to 24 degrees at the first cataract at Elephantine (Aswan). The territory further south was Nubia, extending another 4 degrees to Kerma (19.6 degrees latitude). Kerma was a major site since about 3000 BC and the ancient capital of the Kingdom of Kerma since 2400 BC.

At Elephantine the Duat would have stood in the skies at about 56 degrees up from the south horizon, and at Kerma some 61 degrees. This last is the same latitude as Mesoamerica, where, by the table above, nine rings were seen. Thus the appellation of the "Nine Bows" or "the land (or people) of the Nine Bows" probably entered the Egyptian vocabulary by 3000 BC. After 2349 all the rings disappeared except one and the phrase "Nine Bows" simply meant the foreigners of the "land of the Nine Bows." In the Middle Kingdom of Egypt (circa 2050 to 1492 BC) the phrase had come to mean "enemies."

The Egyptian at various times enlisted the people from Nubia as hired mercenaries, specifically as archers -- the people of the nine bows.

[\[return to text\]](#)

Note 3 --

Dwardu Cardona, in "The Original Star Of Dawn," a talk presented in 1994(?), spoke about the Duat and identified their number from Egyptian sources:

"... a clue as to its real nature [of the Duat] comes to us from its description as having been divided into regions each of which, among other things, was called 'qerert' -- an Egyptian word that means 'circle.'"

He continues with an identification of these circles as the rings of Saturn before 3147 BC, a concept with which I disagree, and which is inadvertently made clear in the following quoted text.

"... besides being called 'qerert,' each division of the Duat was also referred to as 'arret,' that is, 'a hall.' What is of interest here is that, according to the Papyrus of Nu, these halls of the Duat were seven in number, which, among other things, explains the plurality of circles associated with Ra's habitation."

Ra or Re, which means "sun," was at first the name of the creator God Saturn at the north horizon. It is fairly certain that only three distinct bands were seen around Saturn at that time (as the *I Ching* implies). These seven bands are not the rings of Saturn.

After 3147 BC the name of Ra was transferred to Jupiter seen in the ecliptic, first on a mountain, and later riding his ship across the circles of the Absu (for which see a following chapter). What Cardona here calls a "hall" was called a "mansion" in Egypt as well as in the Bible.

[\[return to text\]](#)

Note 4 --

The whole of the Absu, being rounded and with a semi-circular opening, looked like the reed huts which were constructed in the region between the Euphrates and the Tigris in Mesopotamia -- both in antiquity and still today.

In the Andes of South America the doorway of the Absu is reflected in the ubiquitous U-shaped ceremonial centers. For all practical purposes, the Absu framed most of the planetary displays seen from the southern hemisphere. Later catastrophic events mostly happened over the northern hemisphere, and were thus seen in the southern hemisphere only within the doorway of the Absu or in the space above.

There are additional references to the Absu among Mesopotamian seals (most of which appear after 2349 BC; that is, after the fall of the Absu) -- for example, showing the Sumerian Enki, God of water, shedding water and fishes from his shoulders, in effect framing a doorway.

Additionally, there are many mentions of "the gates of heaven," or similar phrasings, in the Bible and classical texts. In Job, Chapter 9, the Lord is He who "... *alone spreads the heaven ... and [makes] the chambers of the south.*" In the King James Version the "chambers of the south" is translated as "constellations of the south." But "chambers of the south" is the Egyptian term for the Duat.

[\[return to text\]](#)

Note 5 --

NASA has formulated a theory to account for the X-rays. The following is from their webpage www.nasa.gov/topics/technology/features/wide-xray.html:

Scientists first discovered the charge-exchange effect in the mid-1990s while observing comet Hyakutake. "They got quite a surprise," Collier said. "They found an intense source of soft X-rays at the comet's head, which was unusual because comets are cold objects and soft X-rays are associated with hot objects. How could balls of ice emit X-rays? No one could figure it out."

Scientists soon discovered that the X-ray emission was caused by the solar wind, a constantly flowing stream of charged particles that sweeps across the solar system at about a million miles per hour. When highly charged heavy ions in the solar wind collide with neutral atoms found in space, the heavy ions "steal" an electron from the neutrals -- an exchange that puts the heavy ions in a short-lived excited state. As they relax, they emit soft X-rays.

Hyakutake was not the first, but it could not be neglected, since it passed close to Earth. NASA is still caught up in the snowball theory of comets. The American Welding Society notes that the arcs of electric welding produce "soft X-rays." (www.aws.org/itrends/04-03/feature.html)

Wallace Thornhill noted in 1993:

"Further evidence in support of the electrical discharge theory was the baffling flare-up of Halley's comet between the orbits of Saturn and Uranus. The nucleus should be frozen and inert at that distance. However a plasma discharge can occur at any time when the electric stress exceeds breakdown potential. It is significant that the flare-up followed some of the largest solar flares recorded. In this case, the Sun was rapidly altering the comet's electrical environment at a far greater distance than normal."

From Wallace Thornhill, in "Evidence for the Extreme Youth of Venus" (1993), *SIS Proceedings of the 1993 Cambridge Conference*.

[\[return to text\]](#)

Note 6 --

There are considerable published papers by Hannes Alfven on plasma theory, extending to the Universe. See *Cosmical Electrodynamics* (1950, 1963), and *On The Origin of the Solar System* (1954).

See also J. H. Piddington *Cosmic Electrodynamics* (1969); Anthony L. Peratt *Physics of the Plasma Universe* (1992).

As mentioned, there are currently two popular books recently published on this subject, by David Talbott and Wallace Thornhill, *Thunderbolts of the Gods* (2005), and *The Electric Universe* (2007). In addition there has been an explosion of plasma-related web sites.

[\[return to text\]](#)

Note 7 --

All other catastrophists that I am aware of hold to a busy schedule of activities involving Mars and Earth, into the 7th century BC. These include Alfred de Grazia, who reiterated his position in the recent book *The Iron Age of Mars* (2009), Donald W. Patten and Samuel R.

Windsor with *The Mars-Earth Wars* (1996), and John Ackerman with *Chaos: A New Solar System Paradigm* (2000).

At the Natural Philosophy Alliance conference in 2011, during an Electric Universe panel on mythology, Dwardu Cardona emphatically insisted that Velikovsky's Venus event of 1500 BC, and the later Mars events of 800-700 BC never happened. Van der Sluijs, sitting next to Cardona, nodded in agreement. The Thunderbolts people simply do not want to be associated with the reaction of instant disgust and dismissal that the name of Velikovsky provokes among "scientists". They feel it hurts their acceptance and approval as serious researchers.

A most interesting history of how the polar location of Saturn developed in parallel between Cardona and Talbott (and a number of other people) since the mid 1970s is presented by Cardona in "The Road to Saturn" in *Aeon* (Volume 1, numbers 1 and 3, 1988). From my perspective the essay confuses many later celestial developments, which are included with the initial time period even though they do not belong there. Also events and actions are frequently mistakenly attributed to the wrong planets.

[\[return to text\]](#)

Note 8 --

Quoted by Leroy Ellenberger from a letter to him by Ashton of September 1, 2007, and sent on in one of Ellenberger's periodic mass mailings, September 11, 2007.

[\[return to text\]](#)

Note 9 --

Leroy Ellenberger pointed out to me (January 2009) that I missed the following names: K. Anderson, M. Armstrong, E.J. Bond, K. Moss, and A. Scott, R.M. Smith, and A.B. Mainwaring. I should point out that there are also another 44 people listed who are not connected to the Thunderbolts group.

[\[return to text\]](#)

Note 10 --

- The site holoscience.com of Thornhill has Velikovsky reduced to "*Since then [since Velikovsky's time] sceptical scholars have shown Velikovsky's historical perspective of cataclysmic events to be wrong.*" The sceptical scholars, or their demonstrations, are not identified.
- Dave Talbott's site thunderbolts.info has nothing.
- The site Kronia.com had an extensive Velikovskian catastrophic exposition, and was owned and operated by Talbott or his associates, has been abandoned.
- Rens van der Sluijs's website used to have details, but all ties to the Thunderbolts point of view have been removed. For van der Sluijs only auroras count.
- Ev Cochrane's site maverickscience.com still has considerable texts on mythology.

There are other sites, intimately connected with the Thunderbolts group (and operated under assumed names), which clearly express an interest in plasma and electric issues, and which have retained the list of catastrophes outlined by Velikovsky.

Additionally there are Internet sites which present a catastrophic world-view of the past and are built on Velikovsky's legacy without any connection to the Thunderbolts group.

You might also find information at the *Velikovsky Encyclopedia* at www.velikovsky.info and the Velikovsky archive of unpublished documents at www.varchive.org.

[\[return to text\]](#)

Note 11 --

Peratt has frequently indicated that the concept of an auroral display is meant as a simile. A presentation authored in 2005 is titled "Evidence of an Influx of Interstellar Plasma from Archaic Z-Pinch Recordings," where the word "interstellar" indicates something beyond an aurora created from a solar wind influx.

Special thanks to K Widen for a better diagram of the Absu.

Recovering the Lost World, A Saturnian Cosmology -- Jno Cook

Chapter 6: Alternate Cosmology.

\$Revision: 42.50 \$ (planets.php)

Contents of this chapter: [\[The Accepted Model\]](#) [\[Two Alternative Cosmologies\]](#)
[\[The Solar System\]](#) [\[Something Is Wrong\]](#) [\[Saturn In the Solar System\]](#) [\[The Genesis of Life\]](#)
[\[Endnotes\]](#)

Alternative Cosmology

This chapter will present the Solar System as it exists today, and hopefully will give you some idea of relative sizes and distances -- which are almost beyond the imagination. The distances in the Solar system are absolutely huge, while the sizes of the planets are microscopic compared to the Sun. Distances to the stars and galaxies are far, far greater yet.

I shall follow this with an overview of the peculiarities of the Solar System to suggest that there is something wrong. The Solar System looks more like a train wreck than a carefully crafted clock.

Next, a description of how Saturn may have first entered the Solar System before the Cambrian, repeatedly returned at intervals of millions of years, and then in the last three million years returned to stay.

Last, I will suggest that the rise of complexity in life-forms after the Cambrian is due entirely to the periodic entry of Saturn into the Solar System. The series of glaciations, which started some 3 million years ago (mya), continued intermittently until very recently, indicating that Saturn had remained in the neighborhood of the inner planets during that time. This period gave rise to a dozen species of hominids, of which we are the last survivors. That will be covered in the next chapter.

The Accepted Model

Cosmologies are models of how things work on the grand scale of everything. Cosmologies thus propose to explain the workings (and origin) of the Universe, the Solar System, the planets. We should start with the accepted model.

To understand where everything came from -- in terms of the "accepted cosmology" -- it would benefit the reader to be familiar with Bill Bryson's book *A Short History of Nearly Everything* (2003) which makes easy reading and will inform you properly. The book starts with the "Big Bang" and progresses, in following chapters, through atomic physics, geology, evolution, and the history of the hominids. (The development of humans in historical time is not covered.) Of particular interest are the vignettes which illustrate the personalities of the people and the processes involved in the ideas which have become current.

I could list a few objections -- for example, on the first page Bryson has creation starting from "a singularity" at the beginning of time, that is, at the start of the Big Bang. A singularity, however, is a mathematically undefined point, which here becomes a physically defined point. An undefined mathematical point, like in dividing by zero, starts yielding infinities but that does not mean that it contains the whole infinite Universe. However, it doesn't matter; this is an abbreviation by a popular writer and, overall, the book is captivatingly written. Occasionally you will run into a statement which clashes with all of common sense, like, *"At this point, 4.5 billion years ago, an object the size of Mars crashed into Earth, blowing out enough material to form a companion sphere, the Moon."* (Only astronomers would have fantasies like that.) However, as I progressed through the book (and came ever closer to the world of today) I had fewer and fewer objections. I'll describe the current Solar System and its planets further below.

Two Alternative Cosmologies

But first we can describe alternative cosmologies. Below are two cosmologies which have sprung from the efforts of established science -- yet they are alternatives to the dominant paradigm. I am not listing here the work of Immanuel Velikovsky, which started the current speculations in the 1950s, and which is discussed elsewhere. Also, a dozen people keep nagging at hair-splitting re-evaluations of Velikovsky's gaps in the history of the Middle East. I will not list this line of inquiry either. And there are still too many folks actively engaged in attributing all causes to meteor impacts. Meteor impacts belong with *Speculative Cosmologies* even if proposed by "established scientists." The flood of other weird theories has abated somewhat, mainly due to the mass of criticism that "ancient maps" have generated. See the Appendix "Other Cosmologies" for additional speculative cosmologies.

[\[note 1\]](#)

Electric Universe

A very important alternative to the handed-down cosmology is the book by David Talbott and Wallace Thornhill, *Thunderbolts of the Gods* (2004), promoted, along with other titles (shown below), at [\[www.thunderbolts.info\]](http://www.thunderbolts.info).

[Image: *Thunderbolts of the Gods*, *The Electric Sky*, *The Electric Universe*. After www.thunderbolts.info.]

Talbott and Thornhill worked with the editorial team of Amy and Mel Acheson, Dwardu Cardona, Ev Cochrane, Walter Radtke, Don Scott, C.J. Ransom, Rens van der Sluijs, and Ian Tresman (all editors, publishers, and contributors to the *Kronia* site, *Thoth* newsletter, *Aeon* magazine, and the *SIS*). Together these people represent an enormous block of knowledge. The theory dates to the electric theory of Michael Faraday (1791 - 1867), the investigations by Johann Geissler (1814 - 1879), and the mathematics of James Clerk Maxwell (1831 - 1879), and specifically to the plasma concepts of Kristian Birkeland (1867 - 1917), Irving Langmuir (1881 - 1957), Hannes Alfvén (1908 - 1995), and Charles Bruce (1927 - 1969).

Wallace Thornhill's contribution has been immense. With the application of plasma theory and electric forces, everything suddenly fell into place. Everything, that is, in the realm of an alternative cosmology. And what a twist to have a cosmology which is frequently held to be a lunatic fringe theory boast of such staid ancestors. But it requires a slight change in thinking - a new conceptualization. A grounding in electric theory (or practice) helps. If you have an inkling of atomic theory, can imagine ions, and feel comfortable with electricity, take a look at the websites of Don Scott, at [\[www.electric-cosmos.org/indexOLD.htm\]](http://www.electric-cosmos.org/indexOLD.htm), and Wallace Thornhill, at [\[www.holoscience.com\]](http://www.holoscience.com), who take up the topic of plasma and an Electric Universe. Don Scott's website does a great job of explaining the plasma aspects. See also a website of Anthony Peratt of Experimental Programs at Los Alamos National Laboratory at [\[public.lanl.gov/alp/plasma/TheUniverse.html\]](http://public.lanl.gov/alp/plasma/TheUniverse.html)

I recommend Don Scott's recently published book, *The Electric Sky* (2006), which details the plasma concepts at planetary and galactic levels. It may be the first time this information has been brought to general readership even though the concepts have been around for 150 years and have been part of electrical engineering curricula for as long.

Talbott and Thornhill followed up their original book with *The Electric Universe* (2007), which represents an excellent introduction to plasma and the electricity of space, the sun, comets, and planets.

Plasma theory is simple, based entirely in classical physics, and has much higher predictive value than the standard model of the Universe. However, there is an immense problem with general acceptance. The problem is attributable in part to academic orthodoxy. [\[note 2\]](#)

"... my impression has been that much of what Thomas Kuhn has called 'normal science;' has degenerated into mindless support of orthodoxy and the so-called 'consensus of opinion,' which is arrived at by a process of one scientist repeating what another has said in a kind of mirror-gallery regression for the fear of falling out with his (or her) colleagues. In the end nobody seems to know how this 'consensus' has originated, but anything that is out of step is ruthlessly suppressed."

-- V. Axel Firsoff, writer and astronomer (1910 - 1981).

Planetary Breakups

A second alternative (but limited) cosmology of some interest is found in Tom Van Flandern's book *Dark Matter, Missing Planets and New Comets* (1999). Van Flandern is a well known astronomer, with interesting theories on planet formation, and other topics, approaching the catastrophic. A promo for his book follows: [\[www.metaresearch.org\]](http://www.metaresearch.org)

"Alternative for the origin and nature of the universe; deductive models for the origins of stars, planets, moons, comets, asteroids, meteoroids, rings, Sun and planet spots; the latest on the hypothetical "tenth planet" beyond Pluto; an alternative to the Oort cloud of comets and the "dirty snowball" comet model; and much more. Since the book deals primarily with observational puzzles and anomalies that don't fit conventional models, many viable alternative models are described."

Van Flandern's main contribution is a "planetary breakup hypothesis as the origin of asteroids and comets," and he offers several mechanisms which might result in a breakup (explosion) of a planet. I think his most interesting theory deals with the formation of planets (and satellites) as expulsions from stars. He uses a model based on mechanical interactions. The results are close to the "electric universe" model and could probably be integrated with the latter. I will return to this further below. Among astronomers, Van Flandern is the dean of gravitational theory.

Van Flandern believes comets are solid and thus predicted that when an 800 pound projectile was to be fired from the spacecraft *Deep Impact* on July 4, 2005, to impact *Comet Tempel 1*, it would make a small dent only, and vaporize the copper anchor. The NASA space folks predicted that the anchor would blow straight through the "snowball" nucleus of the comet. My money was on Tom Van Flandern, and his predictions proved correct. Thornhill also accurately predicted the energy exchange, the flash, and other "surprising" results. See my notes on this at the Appendix "Deep Impact."

[Image: The Corona of the Sun. The tongues of flames reach thousands of miles up from the surface. Earth would be lost in any of these loops. After NASA via Don Scott.]

Additionally, Van Flandern's book (and his website) address more speculative matters, such as gravity, quantum physics, and the Big Bang. He follows Halton Arp on red-shift. See [\[www.haltonarp.com\]](http://www.haltonarp.com). Arp is an observational astronomer who has compiled an extensive array of data which shows the failure of the accepted relationship between red-shifted light and speed of recession for galaxies. Arp has also demonstrated that galaxies give birth to other galaxies, in pairs, along their rotational axes. See his book *Seeing Red* (1998).

To understand the Solar System, we will need a sense of scale, but the representation of the Solar System in any graphic form is difficult. None of the orbits of the Solar System can be drawn to a scale which will show planet sizes at the same time. Below, however, is a scaled presentation -- the Burnham model -- which places the orbits to within a double arm span, although using invisibly small specks for planets. The following, the "Burnham Model," is from Don Scott's website at [\[www.electric-cosmos.org\]](http://www.electric-cosmos.org).

A Solar System Model

We need to start with two facts: the radius of the Earth's orbit, called an Astronomical Unit (AU), 93,000,000 miles (150,000,000 km), and the speed of light, 186,000 miles per second (300,000 km/sec).

"We sketch the orbit of the Earth around the Sun as a circle, one inch [25 mm] in radius. That sets the scale of the model. One light-year is one mile [1.6 km] in this model."

A light-year is the distance traveled by light in a year -- 63,240 AU, which is 5,878,630,000,000 miles. An inch represents an AU, and thus 63,360 inches (a mile) almost exactly represent a light-year.

"The Sun is approximately 880,000 miles in diameter. In the model [this] scales to $880,000 / 93,000,000 = 0.009$ inches [about 1/4 mm]; (Approximately 1/100 of an inch in diameter). A very fine pencil point is needed to place it at the center of the (one inch radius) circle that represents the Earth's orbit."

Neglecting Pluto, the remaining planets all fit within a radius of three feet [a meter] from the pencil-point Sun.

"The nearest star to us is over four light-years away. In our model, a light year is scaled down to one mile. So the nearest star to us is four and a half miles away in our model. So when we model our Sun and the nearest star to us, we have two specks of dust, each 1/100 inch in diameter, four and a half miles [7.2 km] apart from one another. And this is in a moderately densely packed arm of our galaxy!"

Reflect on this for a minute. These distances are absolutely astounding.

The light of the Sun takes 8 minutes to reach us, traveling 186,000 miles per second (300,000 km/sec). A space ship traveling at 20,000 miles per hour (32,000 km/hr) (which is the minimum required to break away from Earth) would reach the Sun in about 150 days. The same ship traveling to the nearest star would arrive more than 100,000 years later and then would look for a place to land.

Relative Sizes

[Image: Relative sizes. These are not the distances between planets. Sun (flaming atmosphere not shown), Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune. Illustration by J. Cook.]

The Sun and the other planets are shown to scale above. The Moon, not shown, is a little smaller than Mercury -- the small dot next to the Sun.

The table below combines the sizes of the planets with the distances from the Sun. It is amazing to realize how tiny our domain in the Solar System is. An AU, below, is 93,000,000 miles.

object	diameter [miles]	relative size	distance from sun [million miles]	distance from sun [in AU]	mass, kilograms [x10exp24]
Sun	864,000	1000	--	--	1,989,100
Mercury	3,100	4	28-43	0.3-0.47	0.3
Venus	7,700	10	67	0.72	4.8
Earth	7,900	10	93	1.00	5.9
Moon	2,157	3	93	1.00	0.07
Mars	4,200	5	142	1.53	0.6
Jupiter	88,700	100	484	5.19	1898.6
Saturn	72,000	80	887	9.53	568.4
Uranus	32,000	40	1,787	19.17	86.8
Neptune	31,000	40	2,797	32.19	102.4

The puzzling thing about our Solar System is that the thinly spread-out planets beyond Mars seem at odds with what little we know of other star systems where the planets which have been detected are very close to their star, although it is possible that we just have not noticed the outlying planets of other systems. We have, in fact, not seen any of the planets of any other stars, we have only observed the transits of the primary (a brief dimming of the star), or the gravitational disturbance these planets produce to their stars (a back and forth movement).

Some Curious Facts

- All the planets travel about the sun in nearly the same plane, more or less at the Sun's equatorial plane, in a band called the ecliptic, which is actually defined as the plane of the Earth's orbit. Thus, seen from Earth, the Sun also travels in this band in the sky. The ecliptic is relatively easy to spot in the night sky if one or two planets can be found. Because the Earth's rotational axis is tilted, however, the ecliptic looks tilted and wobbles across the sky on a daily basis, and differently at different times of the year. Only at the equinoxes (March 21 and September 21) does it stand still, stretching from directly east to directly west.
- In addition to its wobble, the ecliptic is inclined at an angle. It rises up from the southeast at an angle in mid winter, and six months later it rises out of the northeast. The height above the south horizon (in the northern hemisphere) depends on the latitude from which it is viewed. At the equator it mostly stands almost directly overhead, and shows very little wobble. Near the North Pole all of the ecliptic shows above the horizon during summer, not at all during winter.
- As a result, the days and nights are nearly equal during all of the year in the tropics, and days get longer with summer (and shorter with winter) the further north one is located.
- All the planets orbit about the Sun and rotate about themselves in the same direction -- counterclockwise as seen from far above the North Pole of the Sun or the Earth -- except Venus, which slowly rotates backwards around itself, and Uranus, which seems to be lying on its side.
- All of the "regular" planetary satellites (those which obviously are not irregularly-shaped and small-sized pieces of asteroidal debris) rotate in the same direction, and at the equators of the various planets, with only Neptune's moon Triton in a retrograde

orbit. [\[note 3\]](#)

- All the planets travel in ellipses about the Sun, but it would be impossible to tell these ellipses from circles at any visual scale, with the exception of Mercury, which doubles its distance from the Sun over the course of each orbital rotation.

[Image: *The Sun in winter and summer for a mid latitude. Illustration by J. Cook.*]

- The planets closest to the Sun travel the fastest.
- In the conspicuous gap between Mars and Jupiter there orbit millions of rocks and asteroids -- an accident of the remote past.
- Our Sun is a star. The next nearest star in the Milky Way (our galaxy) is 4.5 miles away on the scale of the Burnham Model presented above -- another speck of dust -- but 4.5 light-years in actuality. This is a distance of 26,400,000,000,000 miles -- 26.4×10^{12} miles (42,500,000,000,000 km).
- The Milky Way galaxy contains billions of stars. The distance to the nearest galaxy is incomprehensible. There are billions of galaxies beyond that.

Simulations of space travel as seen in films are wildly inaccurate, but they are part of popular culture, part of how we view ourselves as "in control," even of galactic distances. Stars flit by on *Star Trek*, yet the stars would not noticeably move even at 1000 times the speed of light.

This perception of space as conquerable and controllable results from the fact that planet sizes and interplanetary distances, and by extension the distances involved in the Universe, cannot be properly imagined in our minds. Big numbers just remain meaningless big numbers.

The emptiness of space, the distances between planets, and the diminutive sizes of the planets in relationship to the sun, will remain meaningless unless they can be seen and experienced. This requires a very large-scale model -- small enough to see the distances, yet large enough so that the planets do not disappear altogether from sight.

The distances, the magnitudes, and the emptiness involved in our diminutive occupation of a small parcel in an outswEEPing arm of a remote galaxy, calls for a reduction of these dimensions to a physical model which, if it could be seen, might evolve in our minds some reasonable concepts about the relative magnitudes. The distances involved in our solar system are so large as to be virtually unimaginable and as a result meaningless. Stellar distances are 5 orders of magnitude (100,000 to 1,000,000 times) larger yet. The Burnham Model is a valiant attempt to visualize the distances.

The next table lists the inclination of the axes of rotation of each planet to each planet's orbit (actually the deviation from the perpendicular to the orbit), the inclination of the orbit to the ecliptic, and the eccentricity of the orbit. Since the ecliptic is defined as the plane of the Sun and Earth, the "inclination of the orbit to the ecliptic" is a rather strange measure which in effect places the Earth at the center of the Universe. I have also shown the inclination of the orbits of the planets to the equator of the Sun (by subtracting this from the inclination of Mercury which orbits the Sun at its equator, 7 degrees from the ecliptic).

object	inclination of the axis to orbit [degrees] (C)	inclination of orbit to ecliptic [degrees] (A)	inclination of orbit to Sun's equator [degrees] (B)	eccentricity of orbit
Mercury	0	7.00	0.00	0.206
Venus	177 *	3.39	3.61	0.007
Earth	23.4	0.00	7.00	0.017
Moon	6.7	0.013	6.98	0.017
Mars	25.1	1.85	5.15	0.093
Jupiter	3.13	1.31	5.67	0.048
Saturn	26.7	2.49	4.51	0.056
Uranus	97.8	0.77	6.23	0.047
Neptune	29.6	1.77	5.23	0.009
* within 3 degrees of complete inversion (180 degrees)				

Something Is Wrong

The above information describes how the Solar System is currently configured, but it was not always thus. The first clue that something is awry is the fact that half the planets in our Solar System have the axes about which they rotate tipped 24 to 27 degrees to the perpendicular of the plane of their orbits. One is lying on its side and one is upside down and nearly standing still. (The relative sizes shown in the graphic below are not correct; some are enlarged for comparison.)

When compared to the spin axis of the Sun, the spin axes of the planets fall into two distinct groups. Jupiter, Mercury, and Venus all have their axes at about the same inclination as the axis of the Sun. The spin axes of Saturn and the planets Earth, Mars, and Neptune are all within less than one degree of 30.9 degrees different from the spin axis of the Sun. [\[note 4\]](#)

[Image: Planetary axes of rotation. Planets sizes not to scale. Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune. After www.redshift-live.com.]

Mercury revolves at the equator of the Sun, but its orbit is understood to be inclined by 7 degrees from the ecliptic. The ecliptic is defined as the plane of the Earth's orbit. The inclination of the Earth's orbit thus deviates by zero degrees from the ecliptic but it is actually at an angle of 7 degrees to the Sun's equator. The discrepancies in the rotational axes of the planets show more clearly if they are all compared to the rotational axis of the Sun.

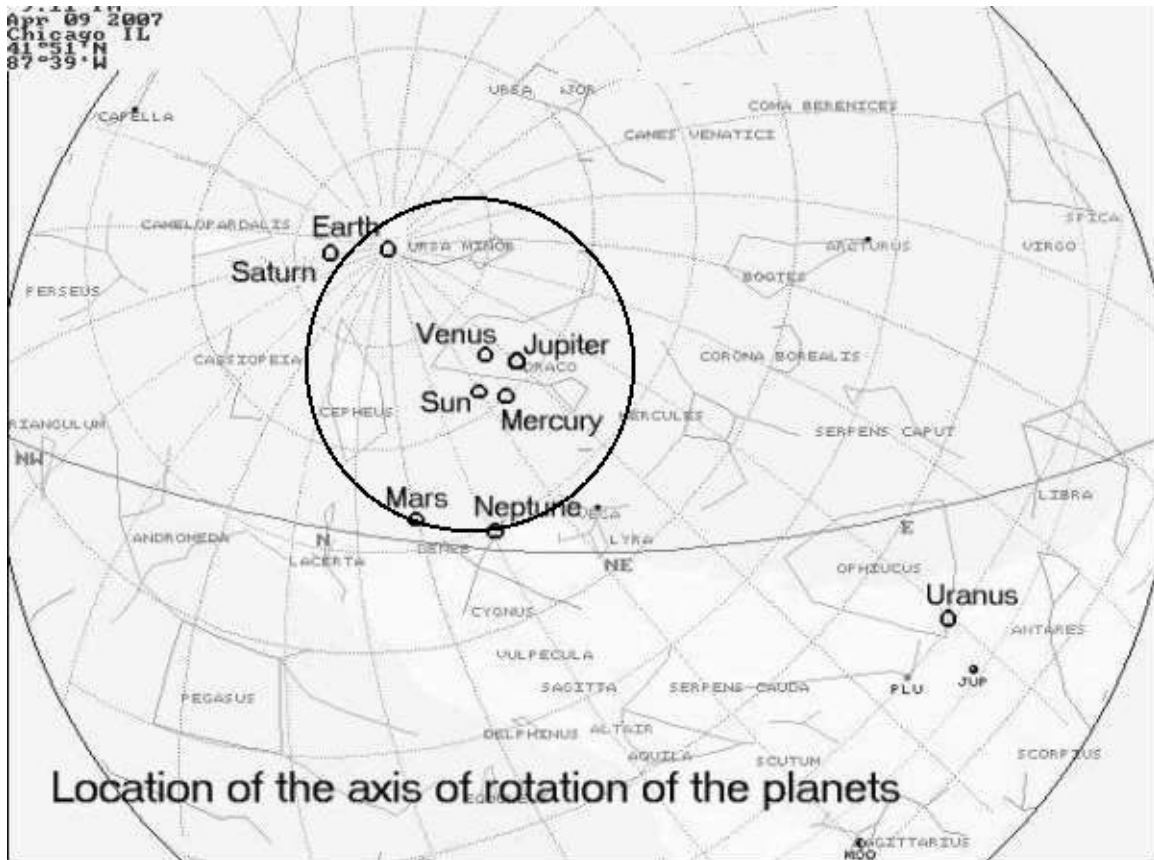

object	inclination of orbit to ecliptic [degrees] (A)	inclination of orbit to Sun's equator [degrees] (B)	inclination of the axis to orbit [degrees] (C)	inclination of of spin axis to Sun's axis [degrees] (D)
Mercury	7.0	0.0	0	0.0
Venus	3.4	3.6	177	-0.6
Jupiter	1.31	5.69	3.13	8.82
Earth	0.0	7.0	23.4	30.4
Mars	1.85	5.15	25.1	30.25
Saturn	2.49	4.51	26.7	31.21
Neptune	1.77	5.23	29.6	31.83

In the chart above, by adding 7 degrees to the inclination of the orbit to the ecliptic ("A" in the chart above) for each of the planets, the orbital inclination of a planet to the equator of the Sun ("B") is found.

By adding the inclination of the orbit to the equatorial of the Sun ("B") to the inclination of a planet's spin axis to the orbit ("C"), the amount that a planet's spin axis differs from the spin axis of the Sun ("D") is found.

This corrects the data we are usually presented. Here it shows the angle of the spin axes of all the planets measured against the axis of rotation of the Sun. I have left off Uranus which has a spin axis located 8 degrees below the plane of the ecliptic, and the Moon. [\[note 5\]](#)

As can be seen, Mercury is the Sun's moon, and the only planet which behaves appropriately as a satellite. The spin axis of Venus is almost parallel to the Sun, but upside down. In that the spin of Venus has been measured as slowing down, it will become another Moon of the Sun in the far future.

[Image: The locations in the "dome of the stars" to which the rotational axes of the Sun and the planets point. Locations from nssdc.gsfc.nasa.gov/planetary/planetfact.html]

Jupiter is at an angle of 8.8 degrees. All the remaining planets are tilted at 30 to 32 degrees with respect to the spin axis of the Sun. The congruence of the tilt of the axes of four of the nine planets becomes even more noticeable when it is realized that all fall to within a degree of each other.

Nothing currently explains why the rotation of Venus is backwards, or why Uranus lies on its side. Nothing explains why Mercury rotates at all, except that it is obviously the Sun's moon.

The Earth's axis of rotation today points to the star "Polaris" in the constellation Ursa Minor. The axis of rotation of the Sun points to a location a few degrees east of the main part of the constellation Draco.

Although all the planets are on orbits which are tilted with respect to the equator of the Sun, and the axis of rotation of each planet is additionally tilted with respect to its orbit, the rotational axes of the planets all point to a place in the sky which either falls close to where the axis of the Sun points, in Draco, or are displaced by about 30 or 31 degrees. The 30-degree circle around the location of the Sun's axis also describes the path through the stars taken by the Earth's polar axis over the course of 26,000 years -- the precession of the polar axis (which is also the path of the precession of the equinoxes). To sum up:

- Jupiter, Mercury, and Venus all point to the same region of the constellation Draco as the axis of the Sun. It is fairly certain, however, that Venus is not part of the original Solar System.
- Only Jupiter and possibly Mercury and the Moon are the original satellites -- that is, the planets -- of the Sun. There were originally three or more additional planets, of which the asteroids are the remnants. Reasons for considering Venus as a recent addition to the Solar System will be made clear in a later chapter.
- The axes of the planets Earth, Saturn, Mars, and Neptune point to diverse locations all about thirty degrees removed from where the axis of the Sun points. I would consider these planets as foreign to the Solar System, although this is not proof. [\[note 6\]](#)
- Uranus has an axis of rotation which falls about 95 degrees away from the axis of the Sun because it is lying on its side (actually 10 degrees below the ecliptic). I will suggest in following chapters that this has been the case since remote antiquity. It can be traced back to the Upper Paleolithic, and was likely seen by Homo erectus.

Saturn and the Solar System

After the Precambrian (560 million ya) and before the Triassic or Jurassic (200 million ya), when Earth was still traveling with Saturn, the infrequent excursions into the Solar System would radically change the heat and radiation received by the Earth as Saturn approached the Sun and changed its coma (for periods of perhaps 15,000 years at a time). The orbit of Earth around Saturn might have been altered, accounting for some of the long-lasting climatic changes. And Earth would become suddenly subjected to plasma discharges from Saturn at arc level as Saturn got yet closer to the Sun -- with all the attendant results. Certainly such events would cause some massive global changes -- severe changes in climate and geological disturbances. It apparently was the cause of the periodic extinctions and subsequent speciation.

Once released from Saturn (200,000,000 years ago), the Earth would have orbited the Sun. But the periodic plasma contacts by Saturn would have repeated, although at a different level of intensity, because the two planets would certainly have come close enough -- both physically and electrically -- to exchange electric arcing. Plasma thunderbolts can travel millions of miles. (In a later chapter I will describe a return lightning strike from Jupiter to the Sun in 685 BC, witnessed worldwide, which traveled 480,000,000 miles -- 773,000,000 km.)

If the plasma arc is localized, it will burn giant craters on land surfaces, vaporize material, raise stupendous clouds of dust, and explosively launch the dust but also large rocks. It will change the climate. If the arc strikes water it will bring ocean water to a boil, raising clouds into the stratosphere which will condense to snow or freezing rain. If this happens near land an ice cover will form, with a much longer climatic effect. Conditions on Earth would be stable for very long periods of time, and then Saturn would reappear in the sky and a brush with death would ensue for the planets near the Sun. The enormous changes in the Earth's

climate over the last 500 million years attest to this.

Saturn thus kept returning to disturb the inner planets of the Sun, although not always to the same degree. But it is not likely that Saturn would ever come very close to any of the inner planets (that is, within a few million miles), because even a few degrees difference in orbital inclination adds up to millions of miles of separation when two planets are both the same distance from the Sun and in the same sector of the ecliptic. [\[note 7\]](#)

In addition, planets do not collide, for they are each protected by their electric field, that is, by their plasmaspheres. Planets do not see each other electrically unless the outer edges of their plasmaspheres touch, generally involving the plasmasphere tail of one planet. Then the plasmaspheres reform, the difference in charge between the two planets, now enclosed in a single plasmasphere, will cause a sudden stupendous repulsive electric field impulse (force). The shock of sensing an electric field is instantaneous and massive. A planet like Earth could be moved to a much larger orbit -- 15,000,000 miles (24,000,000 km) further from the Sun, as in 1492 BC.

This would be followed with an attempt to equalize charge -- resulting in an arc between the two planets which could travel millions of miles. In the case of Saturn and Earth, the arcing lasted for a thousand years.

Saved from Destruction

You might wonder why the Earth was not utterly destroyed with the repeated massive electric field contacts and plasma discharges from Saturn during the previous four billion years. Mars and the Moon and all the planetary satellites have been dried up, evacuated of any atmosphere, and sculpted with craters and scars. Only Earth, Venus, and Titan (a satellite of Saturn), have atmospheres. And only Earth has an atmosphere which does not consist of poisonous gases. Only Earth currently has unfrozen water, and lots of it. During most times the Earth was at a distance from the Sun so as not to be either fried to a crisp or turned into a frozen wasteland. And only Earth seems to be crawling with life. How did we escape the destruction that other planets have experienced? [\[note 8\]](#)

The answer apparently lies with the unique combination of our particular distance from the Sun (which actually is not all that critical), the existence of a magnetic field, lots of water and atmospheric water vapor, an atmosphere, and a fast spin. Earth and Mercury are the only inner planets with a magnetic field. However, Mercury has only a very slight magnetic field currently. And Mercury also is but a small dried-up prune of a planet, nearly standing still, baked ceaselessly by the Sun, and only a little larger than our Moon. It is the Sun's moon. No hope for life there.

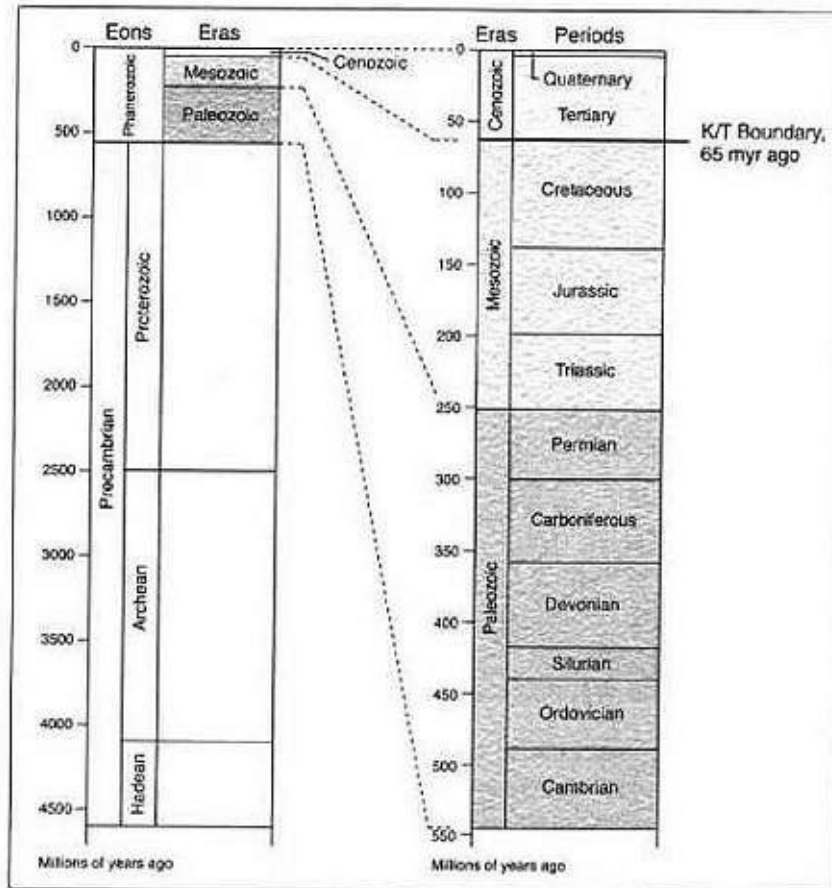

The Earth's magnetic field protects the atmosphere with a tightly held ionosphere. The atmosphere and the oceans, or the shallow inland seas at an earlier time, in turn deflected

much of the damage of any electric plasma strike directed at Earth through the vacuum of space. [\[note 9\]](#)

We were also saved from possible obliteration during the nova event of Saturn in 4077 BC by being located below Saturn rather than at its equatorial plane. Otherwise the nova blowout might have brought humanity to an end, like a similar nova event nearly obliterated all life at the end of the Permian, 250 million years earlier, when Earth was still orbiting Saturn at its equator. At that time Earth suffered plasma discharges at equatorial level to the shallow seas of Central Africa or the Sahara, resulting in a glacier which covered South America, North Africa, and India -- which were joined together at that time.

The Genesis of Life

For the sake of readers not familiar with terms like "Precambrian," "Permian," and the like, I am reproducing a chart of the biological and geological ages of the Earth below -- to scale.

[Image: Geological and biological eras of the Earth.
After Leanne Olds.]

The last 500 million years represent most of the complex life-forms of the Earth; the very last portion of which represents the era of modern humans.

A few billion years ago, the Earth must have been in a condition similar to what Venus experiences today -- a cooling crust, unremitting volcanism, ceaseless lightning, and a turbulent poisonous atmosphere -- conditions which grind rocks to dust and build landscapes. Add water to this mix, and couple it with extreme electric conditions, and you have the makings for the genesis of life. This will probably happen on Venus but it will take some billions of years.

- 560 mya: Cambrian explosion; 34 animal phyla established;
first animals with hard exoskeletons.
- 350 mya: Devonian. First land plants and animals.
- 250 mya: Permian mass extinction.
- 60 mya: Primates (end of dinosaurs); 30 mya: last extinction
- 12 mya: Modern plants and animals;
- 3 mya: glaciers, hominids;
- 0.1 mya: h.sapiens;
- 0.06 my: Cro-Magnon

These same conditions were probably what first brought complex molecules and self-replicating molecules into existence on Earth. Experiments with a reducing hydrogen atmosphere, methane, ammonia, water, and an electric arc have produced many of the organic compounds which form the basis of life. This is, in fact, a popular high school Science Fair experiment. More complex versions of this experiment have produced the long-chained polymer molecules which are also needed and recently have generated cell-like enclosures and the basics of RNA. The probability of achieving a living organism is not all that astronomically high. However, no one has had the time to run the experiments for a half billion years.

But Earth did run these experiments, for nearly 4 billion years. During almost all of that time, "life" never went very far beyond the simplest forms. The "progress" was incredibly slow. And it occurred in two or three spurts. Most of the 4-billion-year-long era is called the Precambrian and it extends over nine-tenths of the history of the Earth.

Early life-forms may not even have had cell walls. But after a half billion years, 3.2 billion years ago, the first cellular organisms (prokaryotic cells) show up in the geological record. These are simple microscopic single-cell forms, akin to bacteria and blue-green algae. They have cell walls and a single chromosome, but no nucleus. There is also evidence of very early photosynthesis pointing to the slow creation of atmospheric oxygen (although the Oxygen may very well have been extant).

After another two billion years (at 1.6 or 1.2 billion years ago), the much larger eukaryotic cells -- cells with a nucleus and other inclusions like mitochondria -- show up. And then, near the end of the Precambrian (560 million years ago) we start to see the first multicellular soft-bodied organisms (worms and plants) -- by evidence left as impressions in mud and sediment. The explosion of life in the Cambrian, and all that followed, is but a continuation of this. However, despite the high complexity of life-forms which eventually develop, it is the first forms, the simple prokaryotic cells (cells without a nucleus, like bacteria), which still constitute the bulk of living tissue today. Gould has estimated that bacteria and other single cell organisms constitute 80 percent of the biomass of Earth today. [\[note 10\]](#)

The three discontinuous steps in the development of cellular complexity are approximately 650 to 700 million years apart. The geology of the Precambrian follows a similar series of geological alterations at 700 million year intervals, paralleling the development of life-forms. I suspect that the cause of each of these alterations was a mass expulsion and severe plasma blasts initiated by Saturn -- a nova event. Many organisms continued to exist throughout the

Precambrian because the life-forms remained below the surface of the Earth's waters.

At the close of the Precambrian we see another massive destruction of the terrestrial landscape. Following this is the most impressive diversification of the complexity of life ever. It is as if species spring up out of nowhere. Some 40 animal phyla show up for the first time, although some may date from before the Cambrian. But only 34 of them last through the extinctions of the following 500 million years, and no new phyla are ever established again.

The genesis of life (barring the complexity of the Cambrian) may very well be a condition regularly experienced by planets throughout the Universe. The process is almost predictable. Certainly the chemistry -- methane, hydrogen, and carbon dioxide gases, water, and electric discharges -- is common, and most of the planets that we have detected elsewhere are close enough to their star to receive heat from their primary.

However, I suspect plasma activity is required to create advanced life-forms -- not a continuous flow, which will destroy all the cellular forms already in existence, but periodic bursts, short enough (15,000 years) to allow a portion of the cells to escape complete destruction but long enough to effectively alter millions upon millions of the organic chemical structures of the remaining cells, almost all of which will die off. A few will survive, with altered forms and functions. This is what we would otherwise identify as the slow "random" process of "natural selection" -- but with a billion years of changes occurring all at once. Left to itself, random changes from chemicals, heat, and Gamma rays will never create anything beyond bacteria -- even given the span of the billions upon billions of years ascribed to the "life" of the Universe. A single nova event at the end of the Precambrian did what the previous 4 billion years had not managed to accomplish. [\[note 11\]](#)

The Earth today would still be largely populated by the ocean-bottom plants and animals of the Precambrian -- seaweed, sponges, and worms -- if it had not been for the much more frequently repeating series of plasma discharges which started some time after the Cambrian. These were completely different from the infrequent novas; they involved attempts at charge equalization by Saturn on reaching the neighborhood of the Sun, a space that was regularly traversed after the Cambrian. Plasma flow is limited by the short time duration that Saturn was relatively close to the Sun on its path through the Solar System.

I would vote for life being almost universal throughout the Galaxy. But I doubt if any of the life-forms will ever get beyond the simplest organisms. It is likely that life anywhere else will never go beyond sponges and trilobites.

Endnotes

Note 1 --

The "ancient maps" controversy involves an interpretation of the Piri Reis Map of 1513. Some authors claim that the map shows an ice-free Antarctica. This was used in books by Graham Hancock as evidence for Antarctica once having been Atlantis.

[\[return to text\]](#)

Note 2 --

David Berlinski, author of *A Tour of the Calculus* (1996), noted, "There is no culture of criticism in science, which is a great weakness in Western civilization. Scientists dominate the agenda. They define the questions that can be answered." And, of course, only they provide the answers. (Quoted from an interview by Julia Keller, *Chicago Tribune*, April 4, 2000.)

Don Scott, in a rebuttal to Tim Thompson's critique of the "Electric Sun" theory writes as follows:

"We stand at a time in scientific history that will be embarrassing to look back on from the vantage point of the next century. An entire subgroup of science consisting of a majority of astrophysicists and cosmologists is now -- and has been -- smugly ignoring the fruits of 150 or so years of electrical science. This subgroup feels perfectly confident in postulating the existence of processes and entities that cannot be verified experimentally in earthbound labs. But that doesn't mean those processes can't happen in space, they say. When there are perfectly valid electrical explanations for certain phenomena, it is irresponsible to ignore those explanations and invent new science to avoid using them. People will ask, years from now, How could they have ignored electricity in space when it was staring them in the face?"

*"Classic astronomy (and its offshoots: helioseismology, astrophysics, cosmology, etc.) have never made any real predictions that turned out to be true although they are past-masters at inventing dynamos and invisible entities to explain things **retroactively**. After-the-fact explanations are easy, especially if you can get away with saying, The hidden dynamo did it ... [C]lassical astronomers were wrong about how the auroras are powered, about the temperature of Venus, about the rocky nature of comets, about x-rays coming from comets and other objects, about the existence of natural radio emissions from the planets. And I claim they are wrong about many things they are now saying about the Sun."*

-- Donald E. Scott, in [\[www.electric-cosmos.org/Rejoinder.pdf\]](http://www.electric-cosmos.org/Rejoinder.pdf)

Academic orthodoxy is not limited to astrophysics. The following is from Mikey Brass, an archaeologist:

"Our past is not reconstructed by archaeologists and historians, but rather constructed. Archaeological facts cannot speak for themselves. Rather, the material remains are

marshalled, compared and manipulated by scholars who are active participants operating within their own social contexts to support mutually inclusive and exclusive hypotheses of past behavioral patterns. The archaeological record is malleable, although we can accept that a cattle bone is 25 mm, that a stone tool is made from a particular raw material and that rock art is concentrated in one area but not another. Thus empirical observations and measurements constrain and frame the viable hypotheses which may be adequately derived from the data sets, although questions must always be asked as to why certain criteria (observations and measurements) were applied in order to prevent a degree of bias as far as possible."

Note 4 --

[Image: Earth and Sun axial and orbital inclination. Illustration by J. Cook.]

The diagram above compares the spin axis of the Earth with the spin axis of the Sun. The diagram would represent the mid-winter position along the orbit, when the plane defined by the spin axis of Earth and the radius of the orbit is perpendicular to the plane of the orbit.

By adding the inclination of the orbit to the equatorial of the Sun, 7 degrees, to the inclination of the Earth's spin axis to the orbit, 23.5 degrees (known as its obliquity), the amount that the Earth's spin axis differs from the spin axis of the Sun is found to be 30.5 degrees.

Of course the condition of having the winter solstice at the "lowest" part of the orbit with respect to the Sun's equatorial (as shown above) does not happen in actuality. But since the orientation of a planet's spin axis in space does not change with travel along its orbit, the calculation is valid even though the diagram represents the equivalent of a thought experiment.

[\[return to text\]](#)

Note 5 --

The Moon just does not fit. The tabular data shown further below.

The geometry for the Moon assumes that the spiral path around the Earth is also an orbit around the Sun. The distance the Moon travels above the Earth (and thus above the ecliptic) can be found from the radius of the Moon's orbit and the maximum angle made with the ecliptic as seen from Earth, $238,757 * \sin(5.145) = 21,410$ mi. The Moon falls below the Earth by the same distance six months later.

[Image: Orbit of the Moon with respect to the Sun; side view. Illustration by J. Cook.]

The orbit of the Moon is a disk differently inclined to the orbit of the Earth, and thus at an angle to the ecliptic. Measured from the Sun, the inclination of the Moon's orbit with respect to the ecliptic can be found as the arctangent, **arctangent(21,410 / AU) = 0.013 degrees**.

object	inclination of orbit to ecliptic [degrees] (A)	inclination of orbit to Sun's equator [degrees] (B)	inclination of the axis to orbit [degrees] (C)	inclination of of spin axis to Sun's axis [degrees] (D)
Moon	0.013 *	6.9	6.7 **	13.6
* 5.14 w/r Earth; 0.013 w/r Sun				
** 6.7 w/r the Sun				

The obliquity of the Moon to its orbit around Earth is 6.7 degrees. This is the angle of the rotational axis of the Moon with respect to the equivalent orbit around the Sun.

[\[return to text\]](#)

Note 6 --

Although the spin axes of Earth, Saturn, Mars, and Neptune all point to locations of the sky which are 31 degrees away from where the axis of the Sun points, it is curious that they are not bunched together. It is this last which would be expected if indeed it is difficult to change the spin of a planet and if all the Saturnian planets came into the Solar System pointing initially to the same location among the stars.

Although today the locations where the axes of these planets point are different from each other, they are all about the same angular measure away from the axis of the Sun. This suggests that, if the axis of a planet is to swing to a new location, it would follow a path which describes a circle which has as its center the rotational axis of the Sun. The question remains, Why would this be so? The only significant physical element in the Solar System which could perhaps have the property of always pointing in the "up" direction of the Sun, might be an up-down magnetic field experienced at the location of the Sun's equatorial disk (which has not been detected).

Combined with a radial current flow at the level of the Sun's equatorial (for which the solar wind would qualify) this would provide a force moving the planets forward. This is the right-hand rule of electricity and magnetism ($\mathbf{F} = \mathbf{B} \times \mathbf{I}$, where \mathbf{F} , \mathbf{B} , and \mathbf{I} are vectors). However, things are not likely to be that simple.

Additionally, there is the curious phenomenon of the precession of the Earth's axial inclination, which advances the Earth's axis in a circle, and is known as the precession of the equinoxes. The center of this circle, which has been confidently defined by astronomers, is the selfsame circle where half the planet axes are located, and which has as its center the rotational axis of the Sun.

However, the precession is caused by the Earth's Moon, the only satellite of any planet which, with every rotation, moves out of and back into the planet's plasmasphere. The disturbance is real (and has been observed since late antiquity), and has been noted to change in the past or drop to zero. But the disturbed axis of the Earth remains at an inclination which keeps it on the 30-degree radius circle about the rotational axis of the Sun.

The often-mentioned notion that the inclination of the spin axis of Earth and Mars are the same, is a fiction. The angles have a close numerical value, but, as can be seen from the diagram in the text, they point to entirely different locations in the dome of the stars. Rather than the axial inclination of the two planets being nearly identical, in reality they differ by over 40 spherical degrees.

[\[return to text\]](#)

Note 7 --

This assumes that there was some random distribution of the inclination of the orbits of the planets from a very early time. Saturn and Jupiter have enough rotational (spin) momentum to have remained undisturbed for a very long time, measuring into the millions of years. Since gravity is a spherical field, nothing would disturb the orbital inclination of a planet once a particular inclination is initiated, except the minor gravitational tugs by the large planets. The wild card in all this is that Saturn came to the Solar System with a large positive charge, unlike the solar planets. Saturn could attract other planets.

[\[return to text\]](#)

Note 8 --

The Huygens space probe, launched by the Cassini space ship, has determined a methane, nitrogen, and carbon dioxide atmosphere for Titan in January 2005. Hardly poisonous, but not exactly benign.

Earth has very few "meteor craters" -- only a dozen have been identified. Venus, similarly, has few small craters.

The distance that the Earth is from the Sun will make the overall climate warmer or colder, but the climate is not likely to be as extreme as it is claimed by astronomers. Gross climate estimates are based on solar radiation, and not on the effects of cloud cover and atmospheric water vapor.

On the other hand, in its very early history the Earth was apparently encased in ice. Some biological theorists have suggested this as an advantageous condition for the development of life-forms.

[\[return to text\]](#)

Note 9 --

Magnetic fields are without doubt the most mysterious aspect of the planets. Nothing -- spin, size, density, or location -- seems to correlate with the magnetic field of a planet. Mercury, thought to have a metallic core, has only a very weak magnetic field. Venus should have a magnetic field since it is the same size as the Earth, but it does not. Yet Venus has a gigantic coma and plasma tail, usually indicated for a planet with a magnetic field. Mars should have a magnetic field since it is larger than Mercury, but has none. Jupiter's magnetic pole is upside down and ten times stronger than the magnetic field of any other planet. Uranus should have a magnetic field closely aligned with its axis of rotation, as other planets do, but the axis of its magnetic field is at right angles to the axis of planetary rotation instead.

The Earth's ionosphere is actually a separate element, consisting of a shell closer to Earth, part of the much larger magnetosphere. I have here also neglected the toroidal Van Allen belts which encircle the Earth above the equator.

[\[return to text\]](#)

Note 10 --

Bacteria reproduce by simply dividing into two organisms, but will exchange their chromosomal material at times. They will also release their chromosomal material to the environment, encased in a shell. These packets might be the source for viruses, whose genesis is completely unknown still.

"Bacteria trade genes more frantically than a pit full of traders on the floor of the Chicago Mercantile Exchange."

-- Lynn Margulis and Dorion Sagan, *What Is Life?* (1995)

Most bacteria reproduce very frequently. An exception is the methane-producing bacteria deep within oceanic muds near coastal regions, which are thought to reproduce only every thousand to ten thousand years.

See also Toby White's essays on early biology at [\[www.palaeos.com\]](http://www.palaeos.com), and especially Boyce

Rensberger, *Life itself: Exploring the realm of the living cell* (1996)

[\[return to text\]](#)

Note 11 --

The outstanding parameter of life is that it reacts to the environment. This is true for single cells as well as complex organisms. Classical evolution theory would hold that this is the inadvertent outcome of repeated extinctions which "select for" those organisms which have the ability to adapt to the environment.

Or so we think. In addition to the possibility that Saturn was responsible for "causing" speciation, the possibility exists that Saturn "brought" life. This is an element of panspermia, although without the notion that "comets bring life," thought to be elements of DNA in dried up bacterial or viral forms. There are no comets, only asteroids. All the asteroids are local to the Solar System. Only Saturn would repeatedly come from outside of the Solar System. Saturn would also spend an estimated thousand years traveling through the asteroid belt (in both directions). I consider the asteroids as consisting of the broken remnants of earlier planets, which may therefore have supported life.

Recovering the Lost World, A Saturnian Cosmology -- Jno Cook

Chapter 7: Ice Ages and Humans.

\$Revision: 42.34 \$ (ice.php)

Contents of this chapter: [\[Recent Glaciations\]](#) [\[Ice Ages and Humans\]](#) [\[Homo erectus\]](#)
[\[Acheulean Handaxe\]](#) [\[Homo sapiens\]](#) [\[Endnotes\]](#)

Recent Glaciations

As I have noted, repeated extinctions mark all biological life on Earth at least since the Cambrian, 560 million years ago (mya). The interval between major extinctions has been estimated to be on the order of 26 to 27 million years. The only two glaciations the Earth has experienced since the Permian (200 mya) also seem to fit the pattern of 26 or 27 million year intervals. These are the Antarctic glacier of 30 mya (some have this as 40 million) and the most recent northern glaciation which started at 3 mya (dated to 2.7 mya).

Based on the likelihood that plasma contacts with Saturn were responsible for the glaciation, it looks as if Saturn arrived again in the vicinity of the inner planets of the Solar System about 3 mya, when the cycles of northern glaciation start. But this time the evidence indicates that Saturn not only returned, but stayed. After some 20 previous entries into the Solar System since the Cambrian, Saturn probably met up with Jupiter, and was forced into a much shorter orbital period -- certainly much shorter than the previous 27 million year period. The electric force between Jupiter and Saturn would have been attractive rather than repulsive -- enough so that Saturn was yanked into a much smaller orbit. [\[note 1\]](#)

The indication that Saturn may have repeatedly returned to travel among the inner planets is the record of a series of intermittent glaciations, followed with sporadic speciation. Included with the new species is the first set of six hominids (after 3 million years ago), followed at a later date with three more. All of these except the very last one, which is us, have become extinct.

The intermittent glaciations of the last three million years would suggest that these plasma contacts were made in passing -- as Saturn passed by -- rather than in a configuration where Saturn would be close to Earth and deliver a stream of plasma over an extended period of time. With 80 percent of Earth covered by oceans, it is also likely that many strikes were never recorded, although there are land strikes (always identified as "meteor impacts") of

uncertain ages.

One much earlier plasma strike to land, which has been dated with some certainty, is the absolutely gigantic circular Chicxulub "cometary" depression in the Yucatan, made about 65 mya and is 110 miles (177 km) in diameter, resulting in the (eventual) demise of the dinosaurs. But even land strikes of plasma in arc mode, if made at various intervals in the past in multiples of 27 million years, are unlikely to leave much of a dateable record today.

[\[note 2\]](#)

It is thus unusual that there were plasma strikes which were close enough to land areas and of an extended duration to leave a record as land glaciers. The start of the last two strikes (of 30 mya and 3 mya) were perhaps qualitatively different from contacts in the more remote past. What was (may have been) different is that the last two series of plasma contacts (30 mya and 3 mya) extended over a long period of time and contacted the Earth from above or below or both (rather than laterally), concentrating at the magnetic poles. The past strikes, like the one that formed the Chicxulub crater (plus 5 additional "craters"), instead may have been gigantic single bolts of interplanetary lightning -- a plasmoid lightning bolt -- not a constant streaming of plasma. [\[note 3\]](#)

Again, however, glaciations, although they may indicate Saturn's visits, are not a reliable index. Glaciers, which end up marking up the landscape with their movements, require a continuous fall of snow over an extended period of time. Thus, a brief plasma contact, or a plasma contact in dark mode which might disperse upon reaching the Earth's ionosphere, would leave no visible record on the Earth's surface.

The plasma stream has to be at least in glow mode, and has to last a long time in order to boil off large quantities of ocean waters. In glow mode the plasma stream would attempt to follow the curvature of the Earth's magnetic field and contact the Earth's surface at the magnetic poles (both the north and the south). At a magnetic pole the plasma stream would increase in density to become visible in arc mode. The arc would vaporize ocean water, raise stupendous clouds, and drop snow in an area maybe a thousand miles (1600 km) in diameter. In northern Europe there are medieval recollections (dating to AD 800) of the hole bored in the North Atlantic ocean by an arc, which had disappeared 3500 years earlier.

But, still, we would have no glaciation record if the magnetic poles were located in oceans far away from land. That may have happened repeatedly in the past. Anytime in the past when the magnetic pole of Earth was located in the middle latitudes of the Pacific ocean or Atlantic ocean there would have been no glaciation at all.

The location of the magnetic pole at any specific time in the past can be triangulated from the direction in which low level magnetism of rocks point at the time the rocks cooled from a molten state (as for example, lava flows). If the rocks can be dated, then a record of the dates and locations of the magnetic pole can be derived. [\[note 4\]](#)

... the geological record

There are three sets of data which bear on glaciation and thus provide secondary data for plasma contacts. The first is the geological record. This consists of the scars and sediment left behind at each advance and retreat of the edges of land glaciers. This is the most reliable record of glaciation. The geological records include those of Northern Europe, Canada and the Northern USA. From these data four recent major land glaciations have been identified, starting at 2.7 mya in Europe, and followed at intervals by the Illinois and Wisconsin glaciations of Canada and the USA. The glaciers have different names in Europe and America. [\[note 5\]](#)

However, the usefulness of the geological record is limited. The glaciations repeatedly built up and retreated and there are long periods during which nothing seems to have happened. Also, a study of where the edges of the glaciers appeared (and retreated) tells nothing of the central areas, and in fact it is still not even agreed if there were three or four glaciers (or five) or how they overlapped. [\[note 6\]](#)

... the Greenland ice cores

Another set of data which bears on glaciation is provided by the Greenland ice cores, from holes bored 9000 feet into Greenland's nearly two-mile-thick (3-km-thick) glacier. These provide a record of temperatures of the fallen snow in the past (gauged from the chemical makeup of the ice), but not over nearly as long a period as, for example, the data from Oceanic Oxygen Isotope cores (see below). The ice cores reach bedrock after 120,000 layers -- assumed to represent 120,000 years.

In fact, the date of 120,000 years ago, when the bottom of the glacier is reached, corresponds to an interglacial warming period, the Eemian, dated from 130,000 to 120,000 years ago, and corresponding to stage 5e in the Oceanic Oxygen Isotope Series (see below). Greenland was apparently clear of glaciers at that time. Antarctic ice cores also reach bedrock in as many layers.

However, there is something wrong here. The interpretation of the data of the ice cores is based on two questionable assumptions. The first assumption is that the glaciation was continuous over long spans of time. But if we accept the idea that intersections with the orbit of Saturn were the cause of the temperature swings and the less frequent land glaciation, we must conclude that the actual periods of glaciation were intermittent and possibly very short. It is only the snowfall in the mountains of Greenland that is continuous. [\[note 7\]](#)

The second assumption is that glaciation is associated with the North Pole. Yet the region of Northern Asia, which, like Greenland, lies within the Arctic Circle, was never glaciated. The glacier layers of Greenland were assumed to represent a year-by-year record of deposition which would vary little from one location to another. Since the center of glaciation moved

over time, even over short periods of time (as the north magnetic pole moves today), we could expect the deposition layers of snow and ice in different locations of Greenland to be different. This has proven to be so; the discrepancy between ice cores bored at different locations has been noted and a concept of discontinuity is being woven into the current analysis by the researchers.

The last boring brought up organic material -- in defiance of the fact that a 120,000-year-old glacier would have obliterated all organic forms and would have scoured the surface clean (as also noted by the researchers). Stuck to the bottom of the drill bit was what looked like a pine needle.

It should also be noted that despite much bragging to the contrary, little data has actually been obtained from the ice cores which correlates to other worldwide events, like volcanic eruptions. Only a single late worldwide event has been correlated, and not with any certainty. [\[note 8\]](#)

The "fine detail" of the Greenland cores record shows swings in temperature as short as 70 years. Some geological records for the same period show even shorter intervals between glacial build-up and retreats -- as short as 20 years. [\[note 9\]](#)

... Oceanic Oxygen Isotopes

A third set of data bearing on glaciation are the Oceanic Oxygen Isotope cores (from the sludge of sunken skeletons of surface foraminifera) which is understood as an index of ocean temperatures near the surface and thus should indicate the existence of glaciation, or at least glacial melting. The data is used as an index of ocean volume compared to the amount of water locked up as land glaciers.

Oceanic oxygen isotope analysis gives results which extend back 65 million years, and is thought to represent a measure of worldwide climatic conditions under assumed stable conditions. The record during the last few million years is extremely variable. The cooler periods during the last three million years have an interval of about 100,000 years (and intermediate intervals at 50,000 years). The standard explanation is that the cold periods correspond to periods of glacial buildup. I will suggest other causes in the second half of this chapter, below.

During the last 200,000 years there are even shorter intervals (20,000 years) between cooler periods. Then at about 60,000 years ago, the variation becomes almost impossibly chaotic, so that in the most recent period we encounter temperature swings at intervals as short as 3,000 years.

The data from oceanic Oxygen isotopes are problematic in that there is likely to be a time lag between glacial buildup and changes in the mix of Oxygen isotopes. Melt waters after a

glaciation ends may give the indication of "cold," even though there is no current glaciation. The melts may have lasted thousands of years. The oceans may not have responded as we would expect them to react under current conditions. For example, based on lake-bottom pollen studies, paleontologists have noted the continuity of plant species indicating warm climatic conditions which carry through periods marked as cold by the oceanic Oxygen isotope studies.

What can be said of all three of these records (geology, ice cores, and oceanic oxygen) is that they represent a lengthy period of glaciations of indeterminate lengths and a wildly chaotic climate -- which may represent the existence of glaciers, or which may have yet other or additional causes. [\[note 10\]](#)

A solution should be sought in the possibility of intermittent plasma contacts with Saturn at the magnetic poles, which would build glaciers on adjacent land areas, which will in turn melt, or at least partially melt (glaciers melt from the bottom), before another contact is made at a different location, because the magnetic pole has had a thousand years to drift to a new location.

Although elaborate theories have been brought forward to account for the temperature swings, it would be difficult to estimate global conditions if they were due to an unimaginable billion ampere arc boiling away an ocean at its contact point, resulting in a continuous snowfall over a region a thousand miles in diameter. And, as I stated elsewhere, I seriously think "warm" climatic periods should be associated with glaciation, and "cold" with the intermediate periods -- rather the reverse of what is held today.

To this should be added the possibility that the plasma contacts could have lasted for years or even hundreds of years and that the contacts could radically change the climate of Earth (for the better or worse) in ways which are totally beyond our comprehension today because we have never experienced anything like it in our stable modern world.

In fact, Book 11 of the Maya *Chilam Balam* recounts the appearances of sacred stones in the skies, at enormous intervals of time -- stones which are trying to bring God into existence as the Christian God the Father. See for this the chapter "The Olmec Record of the Past." As an Indo-European speaker I at first understood the readings of Book 11 of the *Chilam Balam* to speak of arrivals of these stones (it obviously is Saturn and its allied planets), but in the grammar of Mesoamerica (and all the American languages) the text concerns the completion of a period of time, and thus speaks of the leave-taking of Saturn rather than its arrival. This suggests that there might have been long periods when Earth was in plasma contact with Saturn. I have no idea how these periods were terminated.

It is possible to suggest that the proximity of the huge planet Jupiter to Saturn might frequently displace Earth in its orbit so that the climatic effect of the Sun would vary for long periods. Based on scant information from some creation myths, and currently on physical evidence just now developing (after 2009), there exists a clear indication that in 10,900 BC

the Earth's plasmasphere made contact with Saturn's plasmasphere. This resulted in an intense electric field shock, causing the "darkness before creation" which seems to have lifted only by about 9,000 BC, when the climate of Earth suddenly improved.

[Image: Extent of all glaciation over the last three million years superimposed on each other. On the map above, not all of the indicated area was glaciated at the same time. The stars are three estimated centerpoints of glaciation over the last 60,000 years. "X" is the current location of the north magnetic pole. Illustration by J. Cook.]

After 12,000 BC all of Northern Europe and Canada was cleared of ice in a matter of a few hundred years. The cessation of glaciation in Greenland was not an index of this, for the Greenland ice cores continue to count layers of snowfall to the present day. Greenland is, after all, a land of high mountains.

... the last glaciation

The map above would suggest that the magnetic pole moved clockwise across Greenland and Canada. Yet it was the center point off the coast of Norway which was remembered as late as AD 800 as the "maalstroom" (Maelstrom in Norse), a whirlpool.

The accepted last **interglacial** period in Europe, but not elsewhere (or worldwide), stretched from 60,000 to 25,000 years ago. It is a period which saw both the Neanderthals and Cro-Magnon populations in Europe. The Cro-Magnon people are us. The last glaciation followed between 25,000 to 12,000 years ago. The Neanderthals had disappeared by this time, although "pockets" of Neanderthals persist late in Spain and the Levant, perhaps as late as 8000 BC.

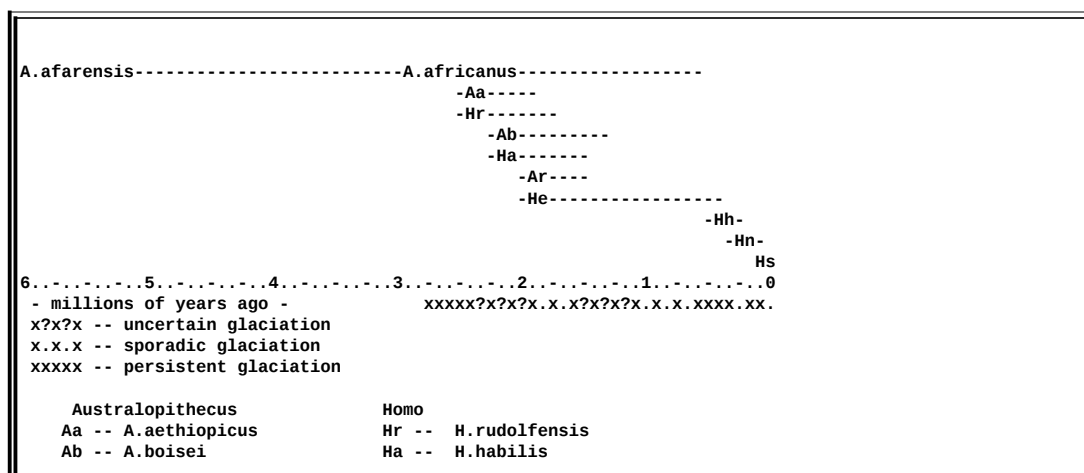

Glaciation and Interglacials for England for the Last Half Million Years		
glaciation or (interglacials)	period Years Before Present	Notes on hominids
Anglian	480,000 -	
-- (Cromerian)	(480,000 - 426,000)	H.heidelbergensis
-- (Hoxnian)	(425,000 - 375,000)	H.erectus (?)
Wolstonian	330,000 - 135,000	tools
-- (Ipswichian)	(135,000 - 35,000)	tools
Devensian	70,000 - 10,000	H.neanderthalensis
-- maximum at...	25,000 and 10,000	English channel dry
-- (Chelford)	(65,000 - 59,000)	H.n tools
-- (Upton Warren)	(42,000 - 38,000)	H.sapiens in Europe
	(25,000 - 8,000)	large mammals disappear
-- cold	27,650	last H.n in Europe
-- ice retreat	14,500	in England
-- (Windermere)	(13,800 - 12,000)	tools
-- glacier gone	14,000	
-- cold snap	12,900 - 11,000	Younger Dryas
-- warming	11,000 and after	channel flooded
-- cooling	8,500 - 6,500	
	8,500 - after	farming established
From diverse sources; subtract 2000 for BC dates		

As an example, the above is the record of glaciation and interglacials for Central England for the last half million years. Some of the periods correspond in name from one country to the next. The "Windermere" interglacial, for example, does, but many of the names and date estimates are local. For example, the "Anglian" glaciation in England, shown above, will not match glaciation names (or dates) for Switzerland. Interglacials -- periods of warmer climate -- are shown in parenthesis above.

I have shown the above to give some scope to the variability of glaciation, as well as to indicate the presence of hominids only miles from the glacier. [\[note 11\]](#)

Ice Ages and Humans

What the data of the oceanic Oxygen isotopes record and the ice cores reveal is a long series of interactions with Saturn. Some of the interactions are of short duration, all are sporadically weaker or stronger, with long periods of thousands of years where nothing happened. The only certainty is that the hominids of the northern hemisphere were repeatedly (in geological time spans) and unremittingly exposed to bursts of plasma. [\[note 12\]](#)

Ar -- A.robustus	He -- H.erectus
	Hh -- H.heidelbergensis
	Hn -- H.neanderthalensis
	HS -- H.sapiens
-- from Robin McKie "The Dawn of Man" (2000)	

There ought to be a coincidence between the "evolving" hominids (or speciation, as I have pointed out in the previous chapter) and the plasma strikes of the last three million years, or, as our only evidence of the plasma strikes, the glaciations. The above chart compares hominids and estimates of glaciation. The table is based on an illustrator's interpretation, done for a popular book, with the various species fading in and out as bar graphs. I'm sure the creation of the chart was supervised and critiqued by "experts" (Meave Leaky, for one) and is probably as close to actuality as we can expect given the almost total lack of fossils and the imprecision of dating.

What struck me, perhaps from the perspective of the bias of my thesis, was that the data of first appearances and extinctions of hominids appear in clumps, so that the appearance and demise of various species or sub-species happen at roughly the same time period (although often with a lag of 50,000 to 200,000 years).

I have shown both the **Australopithecus** and **Homo** hominid species above.

Australopithecus (a hominid species originating 6 mya or more) has no issue after 1.2 mya. I have added the "glaciation record" as an utter simplification. The "persistent glaciation" is based on temperature records, and may not correctly represent glaciation.

Most interesting is how we are represented by only two species for a span of over 3 million years. However, as the northern glaciation of Earth starts up about 2.7 mya, **Australopithecus africanus** disappears, to be replaced in a short time (geological short time) by six new species of **Australopithecus** and **Homo** hominids. [\[note 13\]](#)

For nearly 30 to 60 million years primates had existed throughout the world. They were very common in the northern hemisphere, including North America, 35 mya. But the species disappear from the northern regions everywhere by 30 mya and are reduced to the tropics. It looked like the primates outside of the tropics of Africa and Asia did not survive the changes at the end of the Eocene, 30 mya. At that time we see glaciation in Antarctica, extinctions, and a drop in global temperatures.

"Following the terminal Eocene extinction which took out the Dinocerata, Archeoceti, and most of the Titanotheres and Creodonts, new kinds of mammals evolved and expanded in an evolutionary radiation of many new types. These included the prehistoric ancestors of dogs, cats, rhinoceroses, and horses."

-- [\[www.palaeos.com\]](http://www.palaeos.com)

Nothing much happens with the primates anywhere following the extinctions of 30 mya, except for the bipedalism of **Australopithecus** in Africa. That appears to have happened 6 or

5 mya. Bipedalism is important, yet paleontologists cannot figure out why this change occurred. It is a major change in the bone structure of the legs, hips, knees, and neck. The thinking initially was that bipedalism evolved to release the arms to make tools and carry food. But no tools have been found from this remote time. It would be more likely that the arms were used to carry babies, which could no longer travel on mom's hairy back. (But as usual, this confuses causes and effects.) Bipedal walking, however, is amazingly efficient compared to the knuckle walking of our predecessors. And, as the Central African jungles shrank, walking needed to be done to gather food. A better suggestion has been that the bipedalism is part of a well-developed running ability. We don't sprint any better than other carnivores, but we can run forever.

Australopithecus thus appears adapted to a changing environment -- he is no longer confined to the jungles of the Congo, as his (and our) nearest relatives, the Chimpanzees, continue to be. He could expand his territory as environmental changes continue to occur in Africa after 5 or 4 mya.

About 2.7 mya the northern glaciation starts. Shortly thereafter (in geological time spans) we see a proliferation of **Australopithecus** and the first **Homo** species. **H.rudolfensis** and **A.aethiopicus** appear at about 2.5 mya, while **A.africanus** disappears. This is followed at 2.25 mya by the appearance of **A.boisei** and **H.habilis**.

Diversification and disappearances continued another half million years with the appearance of **A.robustus** and **H.erectus** (2 mya), and then the almost simultaneous disappearance of five out of the six species of **Australopithecus** and **Homo** at 1.75 to 1.5 mya. Only **H.erectus** survives.

If these extinctions had happened in the more remote past it would have entered the biological record as another mass extinction. But because these changes happened so near our time, and especially since they involve our predecessors, the tendency is to think of it as "evolutionary changes," where some species are fit and some are not -- in Darwin's parlance, "due to natural selection."

But in fact we should be impressed by the fact that, after a period of nearly 30 million years during which no "evolution" occurs, we are suddenly confronted by the appearance of six species, all of whom, except one, disappear again after a "mere" million years. I would suspect a visit by Saturn as the speciation event, 2.7 mya, and a return visit about two million years later. That means that, for the first time in 500 million years, the orbit of Saturn had been reduced from 27 million years to a very short orbit of a million years or perhaps even much less.

Only a single species, **H.erectus**, carried through the long two-million-year period only to disappear in turn about 200,000 to 50,000 years ago. This is a long stretch where nothing happened, and it is thought to represent a long interglacial period or only sporadic glaciation. Only towards the end of the 2-million-year span, 500,000 years ago, do we see the

appearance of other **Homo** species -- **H.heidelbergensis**, **H.neanderthalensis**, and later **H.sapiens**. Glaciation had definitely started up again in earnest by then.

Homo erectus

"The suite of discovery, innovation, and increasing intelligence that gave some australopithecine a better ability to hunt, prepare food, and so on, happened perhaps around 2.5 Ma [mya] at a brain size that was typically australopithecine. That suite changed the diet toward meat, higher protein, less chewing, etc., and at some point the evolving jaw reached a morphology [more] typically [of] Homo. The larger brain [of Erectus] came later, but it perhaps came more easily because the jaw musculature was smaller."

-- Richard Cowen, Geology Department at UC Davis.

In the million years after **H.erectus** became the sole surviving hominid, he spread everywhere -- into all of Africa, Asia, Europe (apparently), and possibly into the Americas (although there is only slim evidence of this). **H.erectus** is our only connection to the remote past, the single link to the earlier diversity. [\[note 14\]](#)

Erectus was most likely naked, and had a very thick skull, like the later Neanderthals. Unlike the later Neanderthals, he did not bury his dead. He ate fruit, vegetables, and road kill; but also hunted down antelopes, used fire to roast meat and burn down prairies, and made tools ... well, he made *one* tool.

The Acheulean Handaxe

In the following, Noel Boaz, a paleontologist, reacts appropriately to this long lineage in detailing a single outstanding fact. This is from his book *Eco Homo* (1997). He is writing about **H.erectus**, who ranged over East Africa and Asia (into China) from 1,800,000 to maybe 200,000 years ago (50,000 ya in Southeast Asia) -- a very long time, more than one and a half million years. **H.erectus** had a brain case (after a half million years) only a little smaller than ours, and likely was a lot smarter than dogs, apes, or chimps. But did he "think?" Noel Boaz writes:

*"The available archaeological data on Homo erectus reveals that one type of tool was used for about a million years -- **one** type of stone tool, for a **million** years, all over Africa wherever Homo erectus is found after 1.4 mya. For some reason it is not associated with Asian Homo erectus."*

Actually they are also found in Europe and into the western part of Asia.

"This stone tool is the Acheulean hand axe."

"It is not an easy tool to make and modern Homo sapiens graduate students are not able to fashion a very good one even after an entire academic term of practical experience."

"The implication is that Homo erectus would have expended a tremendous amount of time and energy -- years -- laboriously learning how to make hand axes. The technique must have been passed on by rote repetition. Hand axes stayed the same for untold generations."

"This method of cultural transmission is entirely foreign to us. Nothing that we Homo sapiens learn and internalize stays the same. We have to change it, improve it, make it look better, modify it to fit our specific needs -- be it a chair, an art form, or our own language. But this never occurred to Homo erectus, not in a million years."

-- Noel Boaz, *Eco Homo* (1997)

Erectus made additional tools of stone, but these are at best described as crude, consisting mostly of split pebbles. The Acheulean hand axe is so unusual, and so clearly a finished product of a very specific design, that it almost looks like an import from the future. It is flat, carefully chipped (and sharp) along all edges, almond shaped with the pointed end always displaced to one side of the central axis, and consistently modeled to a shape which does not vary over an enormous span of time and geography. Since it apparently did not enter Central or Eastern Asia or the Americas, we would have to assume a cultural transmission originating in Africa.

[Image: Acheulean hand axe of classical design. Neanderthals in Europe, after about 300,000 BC, reduce the design to look more like an oversized triangular arrowhead with a rounded bottom. After William Calvin, adapted from C.O. Waterhouse.]

What Boaz fails to mention is that the Acheulean hand axe is a very hefty device, a foot high, and weighing over four pounds. It is useless as a tool for working wood, preparing hides, cutting meat, or pulverizing roots. It looks more like an assault weapon for taking down hoofed animals by splitting open their skulls.

William H. Calvin, in "The Ascent of Mind, Ice Age Climates and the Evolution of Intelligence" (Internet, 1990), suggests that the Acheulean hand axe is indeed an assault weapon. When tossed *en masse* by a group of Erectus hominids at a closely packed herd of antelopes at a watering hole, the axes would cause deep cuts in the skin of the animals, because the aerodynamics of the axes cause them to always exit from the fall with its edge down. The eccentric point of the axe would rotate and cause a rip in the skin.

Calvin writes, about experiments performed by Eileen O'Brien:

"The replica indeed spun well; that flattened shape and bilateral symmetry are very useful for setting a spin. O'Brien and her two athletic friends discovered a totally unsuspected aerodynamic property of their hand-axe replica: in mid-flight, it would turn on edge and land that way. Indeed, the hand axe would usually slice into the ground and bury its point."

"... the tendency to land edge-on [and point down] matches up with a previously puzzling aspect of the archaeology: hand axes are often found in dried-up ponds and lakes and creeks, sometimes standing on edge!"

The natural reflex of an antelope, writes Calvin, to an impact by a tossed boulder, is to set out its legs on the side opposite the impact. But the reflex to a tear in the skin of its back is to flex its knees, as when the back catches on overhanging branches as in walking through brush. In the next moment the herd, stampeding in flight from the attack, would have trampled and killed the unbalanced animals.

This reasoning, along with other evidence, suggests group action not unlike the group hunting tactics of chimpanzees today. It requires only the coordination of underhand tosses of the group. But to lob this device at individual animals would require quite a bit more hand-eye coordination. Calvin suggests that this may be one of the evolutionary circumstances which quadrupled the brain of Erectus over the course of two million years.

Considering the failure of Erectus to evolve the design of the Acheulean hand axe, I wonder how they conceived of the design and its use in the first place. The Acheulean hand axe includes three required design elements: It has to be flat, it has to be sharpened on all edges, and it has to have an almond shape. This last item, the pointed shape at one end, is a fine design detail, yet so logically useful (for it is the descending point which rips the skin), that it is amazing it ever came into being.

There is, however, a fourth design element which seems to have no useful function. This is the offset of the pointed end from the central axis of the axe. Yet it is copied from one hand axe to the next on three continents over the course of a million years. Every hand axe is lopsided in design, and they all copy from each other.

Every Acheulean hand axe looks like every other Acheulean hand axe, although there is some variation in overall size. Because of the consistent shape, it has been suggested by some people (I cannot source) that these were religious objects. I will try to answer this question in a later chapter.

In the African Great Rift Valley, at a site known as Olorgesailie, in Kenya, there is a ten-acre site littered with thousands of Acheulean hand axes. The materials were sorted into groups -- raw materials, finished axes, and blunted axes (the last apparently for resharpening) -- suggesting a factory. Raw materials were carted from 6 miles (10 km) away. The factory remained in use for *one million years*. [\[note 15\]](#)

The only possible users of the site (there are no bones found) would have been *Homo erectus*. We can ask the question, "Are these humans or smart animals?" They certainly are not *us*, and there is no indication that we, *Homo sapiens*, *slowly evolved* from these hominids. When we do finally appear, it is complete and with astounding suddenness -- and with hundreds of specific stone tools, spear throwers, detachable harpoons, serrated knives, thread cutters, basketry, weaving, beads, and cosmetics.

Homo sapiens

We are preceded, however, on the European continent, by *Homo neanderthalensis*. In addition to the Acheulean hand axes, both *Erectus* and the later Neanderthals developed the method of making cutting blades by knapping pre-shaped flint nodules. This was a development which may have derived from the Acheulean hand axe.

For 300,000 years these cutting blades (generally known as Mousterian tools) are also consistently the same shape. Clive Gamble notes that it was the process of knapping which was culturally carried forward. The Neanderthal mind was on the technique, not on the end product. Only this explains how the blades remain the same for such an unimaginably long time, and how no variations were ever developed. Yet the Neanderthals were apparently effective predators and scavengers.

But for over 100,000 years (and perhaps 300,000 years) the Neanderthals never once dug a trench to sleep in, set up tent poles, placed rocks in a circle for a fire, pierced shells or pretty stones, carved a representative image, or buried their dead. We, **H.sapiens**, did. And we made art as well. [\[note 16\]](#)

Only during the last 20,000 years, when contact is made with the Cro-Magnon **H.sapiens**,

who had invaded Europe from the east, does the repertoire of the Neanderthals start to include other cutting tools, as well as ornaments. There are even some Neanderthal burials. Not all groups interchanged ideas and materials with the Cro-Magnon. Some remained separate for upwards of 10,000 years. Meanwhile, Cro-Magnons were painting cave walls.

About the explosive material culture, which is seen to arrive in Eastern and Western Europe at the beginning of what (as a result) is defined as the Upper Paleolithic (45,000 to 35,000 ya), James Shreeve, in *The Neanderthal Enigma* (1995), writes:

"New types of stone tools proliferate, taking on regional style where before there was global monotony. In Africa as well as Europe, elegant implements carved from bone, antler, and ivory appear in abundance. Change replaces stasis."

"In France new industries rush in and disappear again like Paris fashions -- the Aurignacian, the Gravettian, the Solutrean, the Magdalenian -- each with technological styles and innovations all but unknown in the period preceding it. From Spain to the Urals, site lists begin to read like proto-Sears catalogs: sewing needles, barbed projectile points, fish hooks, rope, meat-drying racks, stone lamps, temperature-controlled hearths, complex dwelling structures."

The Neanderthals had appeared in Europe a few hundred thousand years ago, preceded by 100,000 years by **H.heidelbergensis**. In Europe, also, **H.erectus** disappears after the Neanderthals show up. **H.erectus** remains throughout Central Africa and Southeast Asia to 50,000 years ago and maybe later. Later finds of skulls in Asia tend to show a combination of features of **H.erectus** and **H.sapiens**, suggesting to some paleontologists an "evolution" of **H.sapiens**, and to others the more obvious interbreeding.

By many estimates **H.erectus** is our progenitor because portions of mitochondrial DNA extracted from some **H.neanderthalensis** do not match ours. Before these determinations, **H.neanderthalensis** was our favored grandparent (which also presumed that **H.sapiens** was European). But there are problems with **H.erectus** also. In addition to the fact that **H.erectus** seemed to have had the brains of a gnat, the skull thickness does not match. Erectus and Neanderthals both have thick skulls, at one time suggested as a defense against club attacks by members of the same species; we definitely do not. Since the identities of various species shift with the identification of additional archaeological specimens, and as a result also their temporal and geographic distribution, there is no telling exactly where we (**H.sapiens**) came from.

By the time we are established as the single surviving species of hominid, our ancestors had passed through three bottlenecks. The first was the disappearance of primates almost everywhere some 30 mya at the end of the Eocene. The second was the disappearance of all except one of the six species of hominids about 1.5 mya.

The third was the return of Saturn 120 thousand years ago. Three of the four species of

hominids in existence at that time become extinct at about 100,000 to 50,000 years ago, although **H. erectus** may have disappeared earlier in Europe. We seem to have speciated at about this time. Perhaps we developed a certain immunity to radiation from the continued plasma strikes. Among paleontologists the typical thinking is that we rose to prominence by wiping out the competing Neanderthals (which mainly existed only in Europe). It is certainly possible, but it is as likely that we either outbred the Neanderthals or interbred. That might also be true for any groups of **H. erectus**, for certainly **H. erectus** traits show up among modern humans. We are very closely related species, and interbreeding would most likely have produced results.

Analysis of *our* mitochondrial DNA (mtDNA), taken from populations throughout the world, places our genesis at about 100,000 to 200,000 years ago -- by mathematical theories of spontaneous changes -- and in East Africa, popularly known as the "out of Africa" thesis. But as noted by R. A. Fonda, one among many,

"The putative common source of all human mtDNA is probably neither chronologically nor causally related to the origin of H.sapiens."

What Fonda is saying is, that the "out of Africa" thesis does not add up. The physical barriers are immense, and the mtDNA trail (the biological inheritance relationship between humans) points to derivations from diverse and long-separated **H. erectus** groups. Fonda suggests a genesis of **H. sapiens** in Eastern Asia as much more likely, followed by the subsequent interbreeding with Asiatic and African **H. erectus** populations. Since Asiatic **H. erectus** can be biologically traced to Africa, the data is easily misread or misinterpreted as concluding that all modern humans came originally from Africa. (The "out of Africa" hypothesis is also politically correct.)

The "moderns" (**H. sapiens.sapiens**) show up in Australia by 65,000 years ago (as Cro-Magnon types, today dated to 40,000 ya), in central Asia and the Levant by 50,000 years ago (currently estimated at 100,000 years ago), in South Africa by 75,000 years ago, and in Europe by 40,000 years ago. We are likely between glaciations during this time. When it starts up again sporadically we are established nearly everywhere. [\[note 17\]](#)

If **H. erectus** was a traveler who could spread throughout all of Asia in a few hundred thousand years, **H. sapiens**, by comparison, races across the globe. After having been sighted in Southeastern Asia (Australia) 65,000 years ago, **H. sapiens** has spread to Southern Europe by 40,000 years ago, the edge of the Arctic Sea by 30,000 years ago, and to the Americas by 30,000 to 50,000 years ago. Estimates vary, but the coincidence of dates is remarkable. About the same time **H. neanderthalensis** and **H. erectus** disappear (**H. heidelbergensis** having disappeared earlier); we are everywhere. [\[note 18\]](#)

Fonda (quoted above) suggests Northeast Asia for the location of the speciation event. He also suggests interbreeding with **H. erectus** in Southeast Asia and Africa. He shows that the chromosomes of the population (of current humans) in these last two regions are further apart

than any other two human groups. He suggests that this is due to the million-year separation of **H. erectus** in Southeast Asia from its ancestors in Africa. Physical characteristics of Erectus show up among **H. sapiens**, as, for example, in the thick skulls of Australian Aborigines.

If the magnetic pole, where a plasma arc from Saturn would touch down, rotated around Greenland to be relocated in Northeastern North America (Eastern Canada), as it seems to have done over the last 60,000 years, then it would have been likely for **H. sapiens** to have speciated (and perhaps in a number of varieties) in North America or Northeastern Asia. But North America was unpopulated 60,000 years ago. (However, Richard Firestone and William Topping, in papers discussed in a later chapter, suggest "*dates [for two North American archaeological sites] should be reset to about 55,000 years before the present and 45,000 years before the present.*")

How did we get there, and especially, how did we get to the Americas? It has been suggested that Native Americans could easily have walked from Alaska to Patagonia in 1000 years at a pace of a mile per day, with frequent rest stops. This assumes humans spread to Alaska from Asia via the Bering Straits. But that discounts the intermediate barriers of the glaciated mountains south of Alaska, the jungles of Central America, and the high Andes. And also, who would want to walk a mile a day for a thousand years?

There is another route, both to Alaska as well as the entire Pacific coast of the Americas, and that is by boat. However, that notion is something almost totally unthinkable to archaeologists who contemplate today's woolly oceans and additionally hold our ancestors as inept. I'll get back to that in a later chapter, for it also involves the spread of languages.

The dates of the appearance of **H. sapiens.sapiens** suggest movement from East or Northeast Asia in the direction south and west into Western Asia, Europe, and Africa. The Americas may have been populated fairly early from East Asia, and Africa may have been populated (invaded) at nearly the same dates as Europe. Along with the early "archaic" **H. sapiens** in South Africa (at 100,000 and 75,000 years ago), the dates suggest travel by boat along the east and south coasts of Asia, the east coast of Africa, and the west coast of the Americas. There are also suggestions of travel to the Americas via Antarctica. [\[note 19\]](#)

Endnotes

Note 1 --

In a later chapter I will present data of the appearances of Saturn and its planets in the past 40,000 years, where records of the Maya *Chilam Balam* books can apparently be matched against a record of excess atmospheric Carbon-14 over the same period. I bring this up at this point only to assert that although the orbit of Saturn seems to have been reduced from

27,000,000 years to 4,000 or 5,000 years, it should not be thought that Saturn was on an orbital period on the order of an Earth year. Apparently this only happened sometime after 10,900 BC.

It should be recognized that the shortening of Saturn's period could only have happened if Saturn came into the solar system from outer space and carried a large positive charge far in excess to the charge on any of the solar system planets. Thus the solar system planets would all be negatively charged (less positive) with respect to Saturn.

An interaction between Saturn and Jupiter would have presented an attractive electric force. Meeting up with Jupiter would have pulled Saturn (if on an outer orbit) closer into the domain of the solar planets (to a shorter orbital period).

The extinction at the end of the Permian, which removed 99 percent of all species, and covered the tropics with glaciers, possibly had nothing to do with the entry of Saturn into the Solar System. If this was a nova event, it could have happened at any time in the 27 million year orbital period of Saturn, although it could be suggested that entry into the domain of the Sun might set the stage for such an event. This goes also for the Cambrian, which, as a matter of fact, is preceded by an extinction event.

If the K-T boundary extinction (the Chicxulub crater) is correctly dated at 63 million years ago, then the Antarctic glaciation would date to $63 - 27 = 36$ **million years** ago. The northern glaciation would then start at $36 - 27 = 9$ **million years** ago. Both of these dates match the current range of estimates for both events.

[\[return to text\]](#)

Note 2 --

The Chicxulub crater is the result of a lateral strike to the Earth (probably as a series of pulses). Saturn and Earth must have been at about the same elevation at the time of the strike. For Tom Van Flandern's comments on the Chicxulub crater, see endnotes in the previous chapter.

G. Keller of Princeton notes (in a paper I cannot locate) of recent geological and dating studies which suggest a 300,000-year interval between the creation of the Chicxulub Crater and the K/T boundary (at geoweb.princeton.edu).

It took the dinosaurs some 10 million years to die out, as estimated by Robert Bakker.

The Chicxulub strike fits the series of regular extinction events. The next extinctions would then be expected at 39 or 40 mya and at 13 or 11 mya and this actually matches the early date of 40 mya for Antarctic glaciation and recent (2007) reports of evidence that the most recent northern glaciations may have first started 11 or 9 mya. Starting dates for glaciation are not easy to determine. I have used 30 mya and 3 mya as the time since the Antarctic and northern glaciations.

[\[return to text\]](#)

Note 3 --

A plasmoid is a disconnected "spurt" of plasma, a thunderbolt traveling as a discrete object. These have been observed experimentally. The disconnection of the arc from the source is due to a lowering of the driving potential after discharge. On release the extended arc tends to condense back upon itself (while traveling) to form a shortened "object" of a distinct shape -- a twisted body with balls and three tines at each end (actually the denser portions of a chalice-like form with a tongue in the middle). The plasmoids are known from sculptural records in antiquity (as late as Roman times), especially in relation to Jupiter, and closely resemble the shapes of the experimental laboratory discharges. Depictions of the Egyptian name glyph for the predynastic pharaoh Narmer ("catfish-chisel"), dating to 3100 BC, is obviously a plasmoid, complete with a rope-twisted body (depicted in one case), a tripartite tail, and a snout with two whiskers. Models of plasmoids, as seen by humans in late antiquity, still exist in Tibet and Japan today. The European *Fleur-de-lis* is a remnant of this design, which is first depicted on coins in late antiquity.

[\[return to text\]](#)

Note 4 --

The magnetic pole was located in the mid-Pacific in the remote past. Over an extended time period it moved north. There is also a record showing the magnetic pole traveling north in the mid-Atlantic. The large displacement of the magnetic pole from the geographical pole of a

planet is not unusual.

[\[return to text\]](#)

Note 5 --

The glaciers, in historical order, are known in Europe as the Günz, Mindel, Riss, and Würm. These correspond to the German names, Weichsel, Saale, Elster, and Weybourne, and the North American names, Nebraskan, Kansas, Illinoian, and Wisconsin. This nomenclature has largely been abandoned in favor of a dating based on the Oceanic Oxygen Isotope record.

The last glaciation, the Würm, started up 70,000 to 60,000 ya. Alpine glacier records suggest that the Würm consisted of four separate glaciation periods.

The Greenland ice core data of the last 120,000 years, which tends to exaggerate temperature fluctuations, suggests 6 long periods of cold (as long as 4000 years) and a greater number of short periods (lasting less than a thousand years). Temperature estimates (the coldest month of winter) from drill cores of a bog in Northern Italy mostly support this, but shows less rapid variation in terrestrial temperatures. Charts are shown in endnotes further below.

[\[return to text\]](#)

Note 6 --

There is evidence of very early glaciation (2 billion years ago), some hundreds of million years (900 to 650 mya) before the Cambrian, during the Ordovician (450 mya), and at the end of the Permian (250 mya). The Permian glaciation has been discussed.

The last glaciation of 3 mya may have started earlier than 2.7 mya. Mark Maslin and Jonathan Adams, in "The Onset of Northern Hemisphere Glaciation during the Tertiary and Quaternary" (*Environmental Sciences Division*, Oak Ridge National Laboratory, 1998), report:

"The earliest recorded glaciation in the Northern Hemisphere is between 10 and 6 Ma [mya] during the late Miocene. [references deleted] This involved a significant buildup of ice on Southern Greenland. However, the process did not gain much momentum until 3.5-3 Ma [mya], when the Greenland ice sheet expanded to include Northern Greenland."

There is currently still no consensus on the dates, ranges, or the number of glaciations over the last 3 million years. The earliest glaciers may have completely melted before the more recent glaciers appeared, dating roughly to after about 60,000 ya.

"The problem is that glaciers act like giant erasers. Each advance eradicates almost all traces of what's come before."

From Wallace S. Broecker "Glaciers That Speak in Tongues and other tales of global warming" *Natural History* (2001).

[\[return to text\]](#)

Note 7 --

My original take on the Greenland ice core data followed the critique of the followers of Velikovsky, but their objections cannot be sustained. See, for example, Charles Ginenthal "Ice Core Evidence" in *The Velikovskian* (1994). This article was heavily disputed by Sean Mewhinney, in "Minds in Ablation" (Internet, 1998). I cannot support either side of the arguments. It seems that nothing has been proven either way.

[\[return to text\]](#)

Note 8 --

That has improved somewhat since I first wrote that statement.

The more recent ice core temperature records are continuous through today, as determined, for example, by traces of lead, which represents Bronze Age smelting practices, the Industrial Revolution of the 18th century, and the use of leaded gasoline in the 20th century. With the introduction of unleaded gasolines the lead traces have dropped.

On the "signature" of the Thera explosion, Peter James, author of *Centuries of Darkness* (1991), writes [reparagraphed]:

"We have always remained sceptical of the case for a high date for Thera [the 16th century BC volcanic explosion], suspecting that the whole thing would eventually fall through. Unfortunately, our position recently led an otherwise favorable reviewer to remark that we took a "sceptical view of the new scientific dating techniques" (Gerding 1997/8, 160), which is far from the truth. Proxy dating is not to be confused with the scientific techniques themselves."

"As it happens, we have now been vindicated. When further work was published on the Greenland ice-cores the real reason why the 1620s date looked so conspicuous became clear. Due to budgetary constraints, a thorough search measuring the sulphuric acid from each year had never been undertaken! When this was done, the 1620s BC 'event' ceased to be special. Similar peaks of sulphuric acid are now known to exist in the 16th, 15th, 14th and 13th centuries (Zielinski, et alii, 1994)! Any of these (for example those from the ice-core years 1594, 1454, 1327 and 1284) might represent the Thera eruption. Worse still, small particles of volcanic ejecta have now been found in one of the very ice-levels from Greenland."

"Analysis has shown that their chemical composition does not match that of Thera (Zielinski & Germani 1998a). Clearly miffed, Manning (1998) published a 'correction'

to the geologists' conclusions, arguing that they had misinterpreted their data and that the particles came from Thera after all. The geologists' response (Zielinski & Germani 1998b) stated, in as many words, that Manning was out of his depth and simply did not understand the methods involved."

From www.centuries.co.uk

[\[return to text\]](#)

Note 9 --

Over the last 250,000 years there were some 17 reversals of the temperature, some representing very short jogs (and thus 8 interglacial periods followed by glacial periods). This represents my inspection of a published chart. Clive Gamble (below) counts 8 complete interglacial/glacial cycles since 787,000 ya, but counts the last five periods since 127,000 ya as one. Other published results have noted 24 interstadials since circa 120,000 ya.

Some of the coldest temperatures are recorded at about 18,000 to 10,000 years ago (this includes the Younger Dryas), and represent a slow gradual decline from a warmer period 120,000 years ago, which followed another cold period of 200,000 to 130,000 years ago (186,000 to 127,000 years ago, per Gamble, below).

[\[return to text\]](#)

Note 10 --

Tables of climatic temperature and chronology are shown by Clive Gamble in *The Palaeolithic Societies of Europe* (1999).

The tables include Oxygen-16 and Oxygen-18 ratios from a Pacific ocean Core, to 787,000 ya (page 103), shown below; another oceanic isotope core, to 350,000 ya, presented as the ratio of ice and ocean levels (page 185) as shown below; and Greenland ice core and a pollen record (an Italian bog), to 80,000 ya, presented as mean (actually the mid-winter mean) temperatures of the pollen site and the ice core, along with ratios for tree and grass pollen (page 187), also shown below. The temperature ordinates have been flipped to show temperature increasing to the top. The units of the abscissa cannot be compared.

[First graph: Oxygen-16 and Oxygen-18 ratios from the Pacific ocean Core, shown as representing oceanic water temperature, from 787,000 ya to the present. After Gamble, page 103.

Second graph: Oxygen-16 and Oxygen-18 ratios from an Oceanic Core, shown as representing ocean and ice cap levels (equivalent to oceanic temperature), from 340,000 ya to the present. After Gamble page 185.

Third graph: Upper chart: Temperature of the coldest month of an Italian bog. Lower chart: Ice Core temperature; From 80,000 ya to the present. After Gamble page 186.]

Gamble notes the chaotic nature of the records, and comments on the fact that there is, as yet, little agreement among researchers on absolute dates, or, for that matter, the mechanism which gave rise to the repeated cycles of glacial and interglacial periods.

[\[return to text\]](#)

Note 11 --

Some of the interglacial periods listed for England do not match Oceanic Oxygen Isotope records which are suggested to represent worldwide temperatures.

The existence of **Homo erectus** in Europe is not well established. Erectus is today held to have a genesis in Africa. At an earlier time he was assumed to have first developed in Southeast Asia and in China.

[\[return to text\]](#)

Note 12 --

The chapter "Event of the Younger Dryas" will present suggestions of electric field contacts with Saturn, based on atmospheric Carbon-14 level changes over the last 50,000 years. In the chapter "The Olmec Record of the Past" I'll suggest that the Olmecs, or their predecessors, had records of the appearances of Saturn dating back to 41,000 years. The record in Europe, which may have been presented with the decorated caves, was cut short with the abandonment of Southern Europe with the cold of the Younger Dryas.

[\[return to text\]](#)

Note 13 --

I have radically abbreviated the whole course of hominid fossils. If you are interested in more details, look at the following two recent books (plus Gamble, above) which describe the development of paleoanthropology and archaeology of the Paleolithic.

Ian Tattersall, in *The Fossil Trail* (1995), describes the workings of the discipline from the perspective of an insider. He has coauthored articles with Niles Eldredge (who developed the concept of "punctuated equilibrium" with Stephen Gould). Especially interesting are the details of how the researchers remained stuck with received wisdom, and only slowly adopted new concepts.

James Shreeve, in *The Neanderthal Enigma* (1995), spends more time on the European and Middle Eastern Neanderthal fossils. As a science reporter, his book is eminently readable, but as inconclusive as Tattersall's. Nothing really is resolved, yet all the data is presented, generally from discussions with the researchers at the source sites. Only in the last two

chapters does he attempt a resolution, but it is entirely based on applying a contemporary perspective to the remote past.

What will strike you, in both books, is, first, that far ranging conclusions are based on enormously sparse data, and, second, that the conclusions which are reached are strongly embedded in contemporary philosophical constructs. Over the past century these have included, for example, the belief that brain volume related to advanced modernity, that there is some innate push toward progress (read, "us") in the changes of fossil forms over time, that only one species of "humans" would have existed at any one time over the last 5 or 6 million years (certainly not so), that all changes in body structure were gradual (driven by some form of Darwinian evolutionary theory), and that our forebears were like us in the many guessed-at aspects of behavior. All of these notions, as these two books point out, are baseless or wrong.

Note 14 --

Clive Gamble notes that hominids (**H.erectus**) did not invade Europe until after 500,000 BC, and suggests a combination of the prior existence of large African predators and a very variable climate as responsible for their absence. The climate was the result of repeated extensive glaciation in Northwestern Europe. The cats disappeared after a half mya, but the variability of the climate in Western Europe, compared to the rest of the world, did not improve.

In Western Europe **H.heidelbergensis** appears after 500,000 BC, followed in about 300,000 BC by **H.neanderthalensis**. Both of these are indigenous to Europe. **H.sapiens** (Cro-Magnon) is a foreigner who invades Western Europe after 40,000 or 50,000 BC from the east.

Note 19 --

The concept of the ice-free corridor between the Canadian Rockies and the Wisconsin glacier which covered much of Canada, which would form a route of entry between Alaska and the northwestern states of the US, has been rethought. "Even when the ice-free corridor existed it was utterly inhospitable," writes Charles Mann, in *1491, New Revelations of the Americas before Columbus* (2006). He also reports that the parallel concept of people streaming through the corridor as big game hunters and the extermination of all the large animals of North America (known as the "Overkill Hypothesis"), has been demolished by paleontologists. Most of the animals disappeared before any sign of humans. (But see my chapter "Event of the Younger Dryas.") Mann quotes Knut Fladmark of Simon Fraser University, as providing an alternative for the population of the Americas, based on migration by (fishing) boats from the northeastern coasts of Asia to the northwestern coasts of Alaska and North America:

"Even primitive boats could traverse the entire Pacific coast of North and South America in less than 10-15 years."

Mann adds:

"Native Americans may have been in the Americas for twenty thousand or even thirty thousand years. ... If [the archaeological date of] Monte Verde [in Chile] is correct, as most believe, people were thriving from Alaska to Chile while much of Northern Europe was still empty of mankind and its works."

A number of people have also suggested that South America was populated by migration via Antarctica, when at various times the coasts were reasonably devoid of ice, unlike today. The location of archaeological sites in southern South America almost force such a conclusion.

This suggests, also, a migration via Australia, and the use of sea-going boats. Considering the very early migrations to the islands of the Pacific (long before the current establishment dates), the trip to Antarctica is quite plausible. The Antarctic ocean, as today, was teeming with fish.

Tunguska and Chicxulub

Originally I attempted to find reasons for the darkness of the Younger Dryas, an aspect of prehistory specifically detailed by the Maya *Popol Vuh* and mentioned in every creation myth worldwide. My solution was to place Earth periodically in the shadow of Saturn, but I never felt that this was a satisfactory solution. Then I ran across the scientific papers by Richard Firestone, et alii, dating to 2001 and 2007 (with a book in 2005), and suddenly the problem of the Younger Dryas was solved.

The Younger Dryas is the period of 10,900 BC through about 9,000 BC. At the start of the Younger Dryas all the large animals (the megafauna) disappeared throughout almost all of the world, the North American continent completely burned up, mountain ridges melted, and the Laurentide Ice Sheet, which had covered most of Canada as the remnant of the last Ice Age, cracked and partially melted. And then, with the start of the Younger Dryas, it got cold, as cold as it had ever been in 30,000 years, and dry, although at first it rained incessantly. All of this is archaeologically well known and established. What has generally gone unrecognized is that these conditions probably resulted from a pervasive darkness which enveloped most of the Earth for 1500 years.

The oldest recollections of mankind, throughout the world, are descriptions of a lasting darkness before the advent of a chaos in the skies and before the "creation" event. At the time when the first narratives were recorded, after 2000 BC and later, the "darkness" was only dimly recollected. It had occurred in a period which at that time lay 8,000 years in the past.

This chapter will deal with some examples from the past which have informed the analysis of the event of the Younger Dryas. I will detail the actual experience of the event of 10,900 BC in the next chapter. In this chapter I want to review the workings of a repulsive electric field interaction, detail how this affects the stratosphere, and relate what happened at Tunguska. The incident of the explosions at Tunguska is something which the Firestone group, as well

as everyone else, will replay endlessly and use as an analogy to explain other events. And I will also show something of the scope of the explosive electric arc damage of both the Chicxulub crater and the Grand Canyon, and present the Great Lakes atomic detonation. These electric field and electric arc interactions are not to be neglected.

"... and darkness was on the surface of the abyss."
-- book of Genesis

Ancient "mythical" records, like the Bible passage above, do not record details of the darkness, so that we do not know if it might have been cyclical. We would have to assume that if the Earth was cast in darkness for an extended period in the remote past, but the period of darkness would have to be moderated -- not darkness, but "shadow" as the Maya *Popol Vuh*, in fact, claims. [\[note 1\]](#)

The Guatemalan *Popol Vuh*, a 16th-century native book in western script and obviously derived from older sources, extensively recalls the period of darkness and cold. The complaints, for a people likely living in the tropical region of Northern Brazil, were of a lack of light and of cold rains. The *Popol Vuh* discusses the "shadow" (and the cold) for the first three quarters of the complete narrative. The *Popol Vuh* also hints at an earlier time of a better climate. As the introduction reads:

"And here we shall take up the demonstration, revelation, and account of how things were put in shadow and brought to light."

But where did the darkness, or "shadow," come from? The *Popol Vuh* never even hints at a cause for the shadow. From what we know of later conditions, the most likely suggestion is that the shadow was the result of an electric field interaction with Saturn, or perhaps one of its companion planets, Mercury or Mars.

If Earth and one of those planets came close enough to have the plasmaspheres touch and merge, the result would have been far from benign. When Earth by chance moved into such a plasmasphere, Earth experienced a sudden stunning electric repulsive impulse, a shock which, if we go by the events discussed in later chapters, would have radically altered Earth's orbit, Earth's landscape, and perhaps Earth's climate.

The above scenario is based on the record of what happened. I doubt if the plasmasphere of Saturn was contacted, because Saturn should be expected to have carried a large positive charge (although perhaps with a negative surface charge), since it came into the Solar System from beyond the plasmasphere of the Sun. Saturn was a star. Thus any Solar System planets would have been very negative with respect to Saturn's positive charge. The resulting electric field interaction should have resulted in attractive forces. And perhaps it was this which was responsible for moving Earth into the gravitational sphere of influence of Saturn (as defined by Tom Van Flandern).

The damaging shock was clearly repulsive, and thus compressed the Earth's surface. A compressive shock would have raised the temperature of the atmosphere of the region facing the other planet by thousands of degrees, enough to incinerate every tree and bush in a radius of a thousand miles -- and, as it turns out, to a radius of 2000 miles (3200 km) in some directions. The carbon dust from this, on entering the stratosphere, would have shut down sunlight everywhere probably for a thousand years. In fact, for 1500 years.

It happened in North America. This is what was reported in scientific papers in 2001 and 2007. It is amazing that humans throughout the world survived the 1500 years of the Younger Dryas. Large animals did not -- a sudden extinction wiped out all the megafauna of North America and later in Asia, Europe, and South America. Within weeks a darkness started to envelop the Earth, and large animals (elsewhere than in North America) were unable to switch to different food sources as these dried up and died out. Smaller animals required less food than the giant herd animals, and survived. After the beginning of the Younger Dryas all of the large herd animals of the northern and southern temperate zones went extinct. The tropics would remain somewhat warmer and thus able to support plants for feed and grazing. India and Central Africa were thus less affected as a result. One species of elephant survived in Africa and another in India. In Northern Asia 12 elephant species disappeared.

The loss of so many large animal species in North America has led archaeologists to suggest an influx of humans around 10,000 BC, who hunted the herds to extinction. This notion, known as the "overkill theory," is no longer accepted as viable. Humans were hunting in North America since some 40,000 years ago. So says Richard Firestone.

Some archaeologists will hold that the "die-off" of the large North American animals happened progressively over this period (13,000 to 11,000 years ago), without any apparent evidence of cataclysmic exterminations. Parallel extinctions happened in Asia (13,000 to 11,000 years ago) and South America at about the same time (circa 11,000 years ago) or somewhat later by a few hundred years, and a separate megafauna extinction had happened already in Australia and Southeastern Asia 41,000 years ago.

Since this original observation, there have been suggestions (of course) of some "meteor impact" at the beginning of the Younger Dryas, specifically in North America. By itself, this does not account well for the other continents. Additionally it is almost absurd to suggest that a meteor, or even a series of hundreds of meteors, could result in 1500 years of drought and the coldest climate ever experienced on Earth, and, as I have mentioned, darkness.

The North American extinctions stand out because of the great variety of species which still existed, mostly undisturbed by humans. Small animals, marine animals, and plants survived. The "die-off" also cannot be blamed on the start of an ice age (despite the start of 1500 years of severe cold), for ice ages had already occurred many times without causing extinctions. The last Ice Age had ended 2000 years earlier. The Younger Dryas chilled the Earth extremely -- it had only once been that cold before, and never since -- but there was no build-up of glaciers anywhere during this period.

An Electric Field Interaction

When Earth encountered the plasmasphere of the other planet -- at the beginning of the Younger Dryas -- all hell broke loose. Impacts like this must also have happened many times before. Richard Firestone provides data which clearly suggests (to me, not to Firestone) two other times when Earth made contact either with Saturn or its companion planets (thousands of years earlier), and many other times which are not as clear. This will also be described in the following chapter.

But the event at the start of the Younger Dryas was significantly different from the two earlier contacts, as described by the data concerning the movement of the Earth's magnetic field. This suggests that the Earth may have remained within or below Saturn's plasmasphere (which included Mercury and Mars) after 10,900 BC. We actually don't know, for it got dark, and it remained dark for 1500 years, so we have no descriptions of what might otherwise have been seen in the sky. Not "darkness" actually, but "in the shadows," as the *Popol Vuh* describes it. By the time the shadows lifted, the Earth was clearly well below Saturn.

Why Earth would have stayed so close to Saturn (although at 3,000,000 or 6,000,000 miles separation -- 10,000,000 km) is an enigma. One explanation is the concept of a "sphere of influence" for gravitational bodies, already brought forward earlier in these texts.

The result of making contact with another plasmasphere can be predicted. It would involve four events, very closely spaced in time. What follows is based on repulsive forces, and the interaction is explained for these conditions. As an attractive force (which it might have been) I cannot readily make sense of the events. Obviously there is much more to this situation than would be suggested at first.

- First, on contacting the plasmasphere of another planet the negative charge of Earth would have been sensed when the Earth fell in line, causing a massive repulsive force -- a shock impulse -- to Earth. The shock instantaneously compressed the surface of the Earth, but also the atmosphere, which would have caused a tremendous increase in the temperature of the air.

The evidence for the 10,900 BC event is for a repulsive shock, which suggests that Earth and some other planet below Saturn were at near equal electric potential. The reason for insisting that the other planet was Saturn and its companions is that after the shadow lifted, Earth was clearly below the south pole of Saturn -- in fact, below Mars.

The repulsive force, if offset from the center of Earth (as, for example, in being applied north or south of the equator), would suddenly tilt the rotational axis of the Earth away from the direction of the applied force. The sudden tilt of the Earth's axis will cause a gyroscopic reaction for the sphere of the Earth. The motion of the gyroscopic reaction would be nearly immediate and smooth, says Chris S. Sherrerd, writing in "Gyroscopic Precession and

Celestial Axis Displacement" (*Pensee* 1973):

"Since gyroscopic precession involves a temporary transfer of angular momentum from spin to precession, when beginning and terminating it moderately affects the rate of rotation of a spinning object and introduces small horizontal forces on points on its surface; but it significantly shifts the absolute orientation of the spin axis in space as long as the precession continues in effect."

And, notes Sherrerd, this would happen without "major tectonic disruptions" and "without large angular decelerating and accelerating forces." This argues against many of the dire consequences proposed by other catastrophists in commenting on "collisions" of planets or "near collisions." We need to curb thoughts of endless tsunamis and sloshing oceans. Even atmospheric reactions would be limited. That is not to say that the shock wave itself would not propagate seismically, and cause extensive earthquake damage. But this is not due to the tilting of the Earth.

- Second, the side of Earth facing the Saturnian planet would have rapidly changed to an induced opposite polarity. This might be due to slight difference in potential, but especially aided by the existence of readily available material which will allow electrons to escape (move away). Obviously an atmosphere would qualify, as would the Earth's ionosphere (where electrons will move elsewhere at a speed of a thousand miles per second -- 1600 km/sec), and also ionized matter repelled from the Earth's surface.

The lightning of thunderstorms operates by way of induction: since like charges repel, the negatively charged overhead thunderstorm clouds clear the ground below of electrons, making the Earth's surface positively charged with respect to the clouds. The voltage at the Earth's surface is thus "induced" by the charge of the overhead clouds. With an induced voltage of opposite polarity at ground level, the voltage difference between the clouds and the ground is now doubled, and is a setup for a spark between ground and the thunderstorm clouds.

Ralph Juergens has related this condition of an induced opposite potential for the situation of arcing between Mars and the Moon (in the 8th century BC), suggesting that it was Mars that responded to the near presence of the Moon by changing the potential of the facing hemisphere to positive, even with an overall coulomb charge much larger than the charge of the Moon. See "Of the Moon and Mars," at [\[saturniancosmology.org/juergensa.html\]](http://saturniancosmology.org/juergensa.html), originally in *Pensee* (1974).

Although Mars has a tenuous atmosphere (which is all that is needed to constitute the density required for a plasma), the Moon (today) has much less. Mars additionally has vast quantities of dust (with a conductive iron oxide content), which even today rises hundreds of feet from the surface of the planet, in tornadoes and planet-wide dust storms.

- Third, with the induction of an opposite polarity on the facing surface of Earth (as the

most likely to yield to an induced voltage) the repulsive force would drop off in intensity very quickly and reverse to become an attractive force.

If the electric field force did not change from repulsion to attraction, Earth would have been propelled out of the Solar System, since there is nothing to curb the initial push away from the Saturnian system. I should point out that sensing the opposing electric charges of the two planets operates instantaneously. But relocating (chasing away) electrons from the region of Earth facing the Saturn system would take time, probably measured in seconds or minutes, so that the whole process of the initial shock, its decline, and the induction of an opposing voltage would span perhaps some minutes.

- Fourth, the difference in polarity would now cause an attempt at charge equalization between the exterior planet and Earth -- an arc would pass between the two. The arc would start up within minutes after the first electric field contact of the planets, soon after the voltage difference was sensed.

Whereas the two planets initially were of the same voltage (potential difference), after an induced voltage has been set up, the planets would be at a potential difference twice the magnitude of the voltage of either planet. (A rough estimate would suggest 10×10^{19} volts.) That will be a very large number, and certainly would drive an arc to travel immense distances, an arc not otherwise ever seen in the Solar System. The arc also would not travel through empty space, but through the planetary plasmaspheres or along its edges.

But an arc takes time to travel, since it consists of physical particles. If the other planet was the cathode and Earth the anode in this electric charge exchange (likely), the arc would have consisted of electrons from the exterior planet, which would be followed soon by protons and positive ions from Earth traveling in the opposite direction. The initial arc would therefore be no different from a terrestrial lightning bolt between clouds and the surface of Earth. It would have melted or excavated the surface of Earth where it landed, forming a crater or digging a hole, and ionized and expelled massive amounts of dirt and dust into the sky, and likely into space.

I should again point the reader to two articles by Ralph Juergens, written in 1974, which suggest such lightning strikes between the Moon and Mars. Part one at [\[saturniancosmology.org/juergensa.htm\]](http://saturniancosmology.org/juergensa.htm) and Part two at [\[saturniancosmology.org/juergensb.htm\]](http://saturniancosmology.org/juergensb.htm). Juergens does a very convincing job of delineating the details. See especially the differentiation of electric anode craters as flat molten surfaces. The magnitude of the electric arc exchange between the Moon and Mars was beyond all belief.

"Explaining a crater floor of bare, once-molten rock in terms of the conventional impact theory is a little difficult."

"One must resort to ad-hoc theorizing to the effect that something -- perhaps the shock

of the postulated impact explosion -- melted a considerable volume of rock at some depth, and that following the explosion this material welled up to engulf the crater floor and flow around obstructions encountered there; otherwise, debris from the explosion itself could be expected to clutter the crater floor."

"Impact theory offers no reason, however, to expect such a sequence of events, and nothing in terrestrial experience with crater-producing explosions supports the idea."

The lightning bolt to Earth would have been lessened in its effect because of the Earth's atmosphere. Juergens (in "Moon and Mars") quotes others to the effect that terrestrial lightning is probably reduced by 90 percent because of dissipation by the air that it travels through. A typical terrestrial lightning bolt would cause a crater 250 feet in diameter on the Moon, rather than, for example, just splitting a tree trunk on Earth.

For a Mars to Moon strike, Juergens steps through the process of developing a leader stroke. For Earth thunderbolts this is the pre-stroke passage of electrons between the Earth's surface and an overhead cloud. For the particular condition of the Moon and Mars, which was accomplished at very close distances (tens of thousands of miles), and did not involve (in this instance) a merging of plasmaspheres.

A contact between Earth and Saturn, or a Saturnian planet, would be significantly different. The distances between the planets would have been immense (millions of miles), and the brushing of one plasmasphere against another might have been the guiding form through which the interactions were accomplished. A leader stroke did not need to be developed, since the double layer at the outer edge of the plasmaspheres is a conductor. The path for a lightning stroke is established as soon as the two planets became electrically aware of each other, although the travel of the actual arc will take time.

I should also point out, that if we could have witnessed such plasma strikes, it would probably have looked a lot like a giant terrestrial hurricane or a tornado, with dust lifted up and swirling in circles about the center. "Electromagnetics and lightning have little or nothing to do directly with what drives tornadoes," says Wikipedia. But that is, in fact, not true; it is only wished to be true by Wikipedia. Just look at the 200-mile-high (320-km-high) tornadoes on Mars, where there is no atmosphere, with arcing at the surface. Tornadoes are exactly what Wikipedia says they are not: the transfer of electric energy between the ionosphere (or, for Mars, space) and the surface. On Mars the arcs at the base of the tornadoes can be seen. They show up as brilliant white patches in photographs. They leave blackened burn trails behind as they move over the surface.

- Fifth, there is a final step in the process. The lightning bolt would cease if its conductive path breaks, perhaps as Earth moved away from the conductive double layer of the other planet's plasmasphere. This would result from the fact that Earth would keep traveling on its path around the Sun. It is also possible that Earth created a new plasmasphere which in effect isolated Earth electrically from its surroundings. It would thus become

invisible again to the field (the electric charge) of the other planet. [\[note 2\]](#)

Considering the ultimate interaction between Saturn and Earth, it could alternately be suggested that most likely the Earth, like the other planets associated with Saturn, eventually assumed an electric potential appropriate to its distance away from Saturn and within Saturn's plasmasphere. This also speaks to the creation of a separate plasmasphere within the plasmasphere of the other planet.

And what about the darkness before the chaos?

I'll suggest that the cause for the darkness was the thermal pulse which would have resulted from the initial compressive shock. This would have raised the temperature of the atmosphere by thousands of degrees. It would have incinerated all of North America. Normally shock waves are of very limited width (thickness), often a fraction of an inch. But this wave resulted not from a point source, as with a detonation, but from the compression of the atmosphere over an area a thousand miles (2000 km) in diameter. This shockwave emanating from the affected area would have been hundreds of miles in thickness. It would have presented a sustained high-temperature condition, not a single sudden hypersonic flash which passed in a fraction of a second.

The expanding compressive shock wave would have lofted ashes into the atmosphere and the stratosphere from the incineration (actually a carbon gasification) of plants and animals by the heat of the blast. The nanometer sized carbon dust in the stratosphere would cause a shadow to descend over the Earth. It is this, the shadow, which is the obvious cause for the cold climate during the Younger Dryas, and the dryness (cold air carries less moisture).

In addition, the electric arc between the Saturnian planet and Earth would send vast amounts of silicate dust into the atmosphere, which, along with the water vapor from the initial short-term melting of the Laurentide Ice Sheet, would likely cause massive rains initially. The *Popol Vuh* complains incessantly about the cold rains of the shadow period. Firestone, et alii, recognizes the rains also.

Let me now expand on all this with the introduction of a sequence of related topics, in the following order:

- nanometer dust in the stratosphere,
- the Tunguska event of 1908,
- the Chicxulub crater,
- the scar of the Grand Canyon,
- the Great Lakes atomic detonation.

The detonation in the Great Lakes region was initially reported by Firestone and William Topping in "Terrestrial Evidence of a Nuclear Catastrophe in Paleoindian Times" (*Mammoth Trumpet Magazine*, 2001).

This was followed in 2007 by Firestone and 24 other authors with an article which addressed the demise of the Laurentide Ice Sheet, the death of the megafauna, and the incineration of the landscape of North America, in "Evidence for an extraterrestrial impact 12,900 years ago [10,900 BC] that contributed to the megafaunal extinctions and the Younger Dryas cooling," (2007). I'll address this second paper in the next chapter.

Nanometer Dust in the Stratosphere

The information about nanometer dust in the stratosphere (not the atmosphere) is straightforward, and even though based on "models" of climatic results. It has been an accepted and tested point of view for decades (originally as the "nuclear winter" scenario). I am introducing it below because it easily explains the "darkness" or "shadow" of the Younger Dryas. This effect has been largely neglected by researchers involved with the cataclysm at the beginning of the Younger Dryas, for it represents a massive extension of the scale of the climatic effects, despite the admission by the researchers that the cataclysm itself was absolutely overwhelming.

[Image: Stratosphere above the clouds. After Gerard Marull Paretas, Sergi Saballs Vil, Martm Gasull Morcillo, Jaume Puigmiquel Casamort, (C) Barcroft Media.]

This is also something they (and we) do not want to think about, since the possibility for a nuclear winter remains hanging over our heads as long as we have a proliferation of nuclear weapons and unstable governments.

The concept of dust in the stratosphere is addressed in an article in the January, 2010, issue of

Scientific American, by Alan Bobock and Brian Toon, "Local Nuclear War, Global Suffering," which makes the case that a limited regional war between India and Pakistan, which would detonate about 100 Hiroshima-sized nuclear weapons (15 kiloton of TNT yield each), would loft micrometer-sized smoke (1000 nanometers) into the stratosphere -- resulting in crippling global agriculture for a period of 10 years. Ten years is a conservative estimate. The editors of *Scientific American* sum up the article in a side bar:

- *"Nuclear bombs dropped on cities and industrial areas in a fight between India and Pakistan would start firestorms that would put massive amounts of smoke into the upper atmosphere."*
- *"The smoke would reach the troposphere [the upper region of the atmosphere] within two days. The sun would then heat the tiny particles and loft them into the stratosphere. Precipitation never occurs there, so particles would take about ten years to fully settle to earth's surface. Smoke in the troposphere washes out within a week or so."*
- *"The particles would remain there for years, blocking the sun, making the earth's surface cold, dark, and dry. Agricultural collapse and mass starvation could follow. Hence, global cooling could result from a regional war, not just a conflict between the U.S. and Russia."*
- *"Cooling scenarios are based on computer models. But observations of volcanic eruptions, forest fire smoke and other phenomena provide confidence that the models are correct."*

"Cold, dark, and dry" are short for the conditions complained about in the *Popol Vuh* for the first three-quarters of the book, except that it is endless rains, rather than dryness, which is part of the complaint of the *Popol Vuh*. The rains at the beginning of the Younger Dryas are the result of the initial water vapor from the partially melted Laurentide Ice Sheet and the silicate dust and particulate matter in the atmosphere due to an interplanetary lightning strike. The excess water vapor in the atmosphere would be turned to rains by the atmospheric dust, even in a cooling climate. Climatologists have especially noted that the tropics received extra rain during the Younger Dryas. The *Popol Vuh* records this condition for a latitude of 10 to 15 degrees north.

A similar condition of initial rains was noted for the period after the year 1492 BC: initially, massive rains washed soil away, and then rivers and lakes went dry.

The authors Bobock and Toon, of the *Scientific American* article, write about their model:

- *"The smoke covered all the continents within two weeks. The black sooty smoke absorbed sunlight, warmed, and rose into the stratosphere."*
- *"The climatic response to the smoke was surprising. Sunlight was immediately reduced, cooling the planet to temperatures lower than any experienced for the last 1,000 years. ... Precipitation, river flow and soil moisture all decreased because blocking sunlight reduced evaporation. ... Drought was largely concentrated in the lower latitudes [the sub-tropics]."*

The "nuclear winter" model has been around for thirty years. The authors only provided improvements in modeling. They tested their model against historic volcanic eruptions -- Tambora 1815, Krakatau 1883, Pinatubo 1991. They write: *"The surface temperature plummeted after each eruption in proportion to the thickness of the particulate cloud. ... Global precipitation, river flow and soil moisture decreased. Our models reproduce these effects."* The authors mention that volcanoes produce sulfate clouds (Sulfur Dioxide aerosols), which remain suspended in the upper atmosphere "for some time," but do not rise into the stratosphere.

Other sources (like Wikipedia) disagree on the clearing time for volcanic eruptions, thinking it to be longer. Based on the effect of the 1991 eruption of Mount Pinatubo (the largest since Krakatau in 1883), a period of years (rather than "some time") is suggested:

"Stratospheric sulfur aerosols are tiny sulfur-rich particles of solid or liquid, or a mixture of the two, which exist in the stratosphere region of the Earth's atmosphere. When present, after a strong volcanic eruption [which can "inject" gases directly into the stratosphere] such as Mount Pinatubo, they produce a cooling effect for a few years before the particles fall out, by reflecting sunlight, and by modifying clouds as they fall out of the stratosphere."

"An aerosol is a suspension of fine solid particles or liquid droplets in a gas. The sulfate particles or sulfuric acid droplets in the atmosphere are about 0.1 to 1.0 micrometer (a millionth of a meter) in diameter [100 to 1000 nanometer]."

-- Wikipedia

I should point out again that the estimate of the duration of the cooling and drought as 10 years is a conservative estimate. I am offering this information as a base condition to events involving extensive wildfires. Later chapters will point up two other periods of drought and coolness which were recorded by the people of Mesopotamia and Mesoamerica, and which can be attributed to events of 2193 BC and 1492 BC. The 2193 BC event was felt in Sumer and in Egypt as a failure of agriculture, and lasted 200 years. In Egypt the Old Kingdom came to an end; in Mesopotamia the Akkadian empire fell as agriculture was inhibited by a lack of sunlight.

The Tunguska River Event in 1908

Electric field interactions between charged objects have been witnessed by humans. On June 30, 1908, at about 7:30 in the morning, a bolide from outer space approached the Earth's surface at the Stony Tunguska river in Siberia, and exploded. Deafening explosions were heard hundreds of miles away.

[Image: Tunguska. After the Leonid Kulik Expedition.]

A shock wave traveled twice around the Earth. From 40 miles (60 km) away it was experienced as a fireball in the sky, a flash of heat, followed by a series of explosions. People were knocked down, and windows broken.

Reindeer herders 30 miles (50 km) from the center of the impact were thrown about while in their shacks by the air shock, while singed trees fell around them. There were 4 thunderous explosions, the earth shook, and a horizontal shockwave felled trees over an area larger than New York City. A flash of heat set dead tree branches and moss on fire.

But there was no impact, there was no crater, there was no meteor debris. Sixty million trees, some up to three feet (a meter) in diameter, and 15 to 20 miles (30 km) away from the center, were blown over, yet the trees in a five mile (8 km) diameter circle at the center were left standing, with only their branches removed. Trees within the central half of the area were scorched.

William K. Hartmann, in "1908 Siberian Explosion: Reconstructing an Asteroid Impact from Eyewitness Accounts" (Internet, 2010), summarizes the extent of the event as follows:

"Seismic vibrations were recorded by sensitive instruments as much as 1000 km (600 mi) away. At 500 km (300 mi), observers reported 'deafening bangs' and a fiery cloud on the horizon. About 170 km (110 mi) from the explosion, the object was seen in the

cloudless, daytime sky as a brilliant, sunlike fireball; thunderous noises were heard. At distances around 60 km (40 miles), people were thrown to the ground or even knocked unconscious; windows were broken and crockery knocked off shelves. Probably the closest observers were some reindeer herders asleep in their tents [huts] in several camps about 30 km (20 mi) from the site. They were blown into the air and knocked unconscious; one man was blown into a tree and later died. 'Everything around was shrouded in smoke and fog from the burning fallen trees.'"

-- www.psi.edu/projects/siberia/

Well, not "burning trees" by other reports, nor "blown into the air" either, as the actual accounts further below will show.

Hartmann estimates the explosive energy reaching the ground as the equivalent to 60 atomic bombs (a value of about 900 kilotons of TNT). But this represents about half of the total energy involved. He calculates the total energy at 1500 kilotons of TNT -- two orders of magnitude (100 times) greater than the Hiroshima atomic bomb of 15 kilotons. Others have estimated 3 orders of magnitude (1000 times) -- 15,000 kiloton. Some Russian researchers have estimates of less than 15 kilotons of TNT, which might actually make much more sense. I'll return to the sense of scale further below.

... description of the event

"In the settlement of N[izhne]-Karelinisk (about 200 versts [130 miles, 200 km] to the north of Kirensk) the peasants saw in the northwest, quite high above the horizon, some sort of body glowing with an extraordinarily intense (such that you couldn't look at it) blue-white light, moving downwards from above over the course of 10 minutes. The body took the form of a "pipe," that is, a cylinder."

-- Irkutsk newspaper *Sibir*, 2 July 1908.

If my sense of direction and distance is correct, then the view from Nizhne-Karelinisk was from a direction somewhat south of east from the impact area, and about 170 miles away (275 km). The object in the sky must have been huge to be seen from such a distance. But this was the coma which was seen, a shape much larger than the actual physical object. What was seen was an asteroid (meteor) going into arc mode plasma discharge ("intense, blue-white light") which soon developed a plasmasphere tail (a "pipe"). [\[note 3\]](#)

In arc mode discharge the object would have been under severe stress, since in arc mode the current can increase without limit. This would soon have resulted in the explosive rupture of the rock of the asteroid.

This was, by the way, an asteroid -- a rock or set of rocks. It has been called a meteorite, but

"meteorite" is the name for an object that enters the Earth's atmosphere and makes it to the ground. It has also been called a "meteor" or a "comet," but again, the word "meteor" is used for any object which develops a streak on entering the Earth's atmosphere (or so it is thought), whereas a "comet" is a far away object which exhibits a plasma tail. Comets are thought to be balls of ice, and their tails are thought to represent, as one website explains without blinking, "gas flying off the comet" and "ions being blown away by the solar wind."

Comets are not balls of ice; they are rocks, and thus are asteroids, although old definitions have a tenacious hold on the minds of NASA Press Release writers -- and not a few scientists. Much of the analysis of the Tunguska Event has been built around the "explosive" effects of a ball of ice in the Earth's atmosphere. [\[note 4\]](#)

The Tunguska "comet" probably did not reach the atmosphere, since it blazed for ten minutes. What was seen were electrons being released -- torn out of the silicate matrix of the rock -- in an attempt to accommodate the voltage of the intruding asteroid to the electric field of the Earth. Entering the Earth's plasmasphere, the asteroid would be at a potential mismatched to that of the Earth. The fact that the "pipe" behind (or above) the object extended a finite distance is significant in indicating how far behind the asteroid, in time and distance, the voltage equalization was. The pipe was, at any rate, not described as a smoky trail, like that of a rocket or burning object, nor as a pointed spike or a curved tail typical of far-away comets. In "ten minutes" of being propelled at an average speed of 20,000 miles per hour (32,000 km/hr), the bright object was obviously not within the atmosphere of Earth most of the time either. If it was seen approaching for ten minutes, it would have traveled 3000 miles (4800 km). The atmosphere extends about 75 miles (120 km) up.

What I would expect to happen next, as the asteroid headed toward Earth's surface at an (estimated) angle of 15 or 30 degrees (which is not material) is that after the arc mode plasma would rupture the rocks, the "blue-white" arc mode would disappear in favor of a glow mode display (because more surface area was suddenly provided). And, in fact, many observers first saw the object after hearing the first of four explosions and describe it as glowing or in flame. The color of a "flame" is not the "extraordinarily intense blue-white light" described earlier. So it was no longer in arc mode at this time.

"At the beginning of the ninth hour of the morning, local time, there appeared a fiery sphere which flew in a direction from the southeast to the northwest. This sphere, as it neared the earth, took on the form above and below of a flattened sphere (as was visible to the naked eye); approaching even nearer to the earth, this sphere had the look of two fiery columns. As that enormous mass fell to earth, there occurred two strong crashes, like thunder, but the fact that the sky was completely cloudless may serve as proof that it was not thunder."

-- M. R. Romanov, observer, 1908.

Romanov reported what was perhaps a split tail, which other observers might not have seen.

It would depend on their vantage point. One tail would consist of glowing silicates, actually leached from the asteroid ("sputtered") and strewn (electrically repelled) along the path of its trajectory. The other column would be located straight up from the asteroid and consist of electrons and ions defining a shadow of the earth's electric field -- and thus pointing away from the Earth above the incoming object. The observation may also represent the flattened sphere suddenly being blown back along its trajectory (or more likely at a right angle to the Earth's surface) on sensing the Earth's repelling electric field.

Importantly, he describes a "flattened sphere." I was actually on the lookout for a "flattening" among the eyewitness reports, for I would think that the next event in order would be a massive repulsive electric field force between the object and the Earth, which would have affected both the asteroid and the "impact location." There are three reports of a flattening. In the newspaper article quoted below it is described "as if the body spread out."

*"Nearing the ground (the forest), it was as if **the shining body spread out**, in its place there formed an enormous puff of black smoke and there was heard an extraordinarily powerful rumble (not thunder), as if from large falling stones or cannon fire. All the structures shook. At the same time a flame of undetermined form began to break out of the cloud."*

-- Sibir newspaper report.

The black cloud might have been a pulverization or breaking up of the asteroid. The black cloud would not have been a shadowing by the Sun, which at that time of day was about 26 degrees up in the eastern sky. (Sunrise at 61 degrees north latitude is at 2:38 AM at 54 degrees north of east on June 30th.) It was not observed if the Earth's surface was hit, for the impact location could not be seen (being 170 miles away, 270 km). But it is certain that the ground had been hit with a massive compressive impulse, which would translate to a flash of heat, because as the pressure of contained air goes up, so does the temperature (the Gas Law formula is $pV = nRT$). At the speed with which this happened, the air would be considered as briefly contained, that is, incompressible. The same compression, of course, would happen at the bolide, and most likely explains the "black cloud" as dust. A heat wave moves at the speed of light.

The observation of a "black cloud" matches other observations which mention that "the sky opened up." I considered this a very strange observation, and initially thought of it as idiomatic to the local Siberians who furnished the descriptions. But after repeated reports I started to understand the "opening of the sky" as expressing the notion that suddenly and briefly, and over a limited area in the sky, the stars were seen. This is to be expected as a result of an instantaneous compressive impulse, which in effect moved all the atmosphere aside. The stars were seen.

An additional impressive account of the possible disintegration of the bolide was provided by Leonid Kulik (who first investigated the site in 1921, and made additional visits up to the

1930s), as reported by an eyewitness, Semen Semenov. Again we have the suggestion of the object flattening or, as stated below, widening:

*"I suddenly saw that directly to the north, over Onkoul's Tunguska road, **the sky split in two** and fire appeared **high and wide** over the forest. The split in the sky **grew larger**, and the entire northern side was covered with fire. At that moment I became so hot that I couldn't bear it, as if my shirt was on fire; from the northern side, where the fire was, came strong heat."*

"I wanted to tear off my shirt and throw it down, but then the sky shut closed, and a strong thump sounded, and I was thrown twenty feet. I lost my senses for a moment, but then my wife ran out and led me to the house. After that such noise came, as if rocks were falling or cannons were firing, the earth shook, and when I was on the ground, I pressed my head down, fearing rocks would smash it."

"When the sky opened up, hot wind raced between the houses, like from cannons, which left traces in the ground like pathways, and it damaged some crops."

This is the third instance of a flattening or broadening of the object, here presented as "the sky split in two" followed by "the entire northern side [of the sky] was covered with fire." Again, here is a description of the sky "opening up." The same compressive forces experienced at ground level also resulted first in a compression and then an expansion of the atmosphere below the bolide, likely shattered the bolide, and brought the dust and particulate matter to incandescence. The radiant heat was felt immediately by Semenov, followed by a shove of what I will here suggest was a repulsive electric field force between the Earth and the bolide.

This would be minor compared to what would be experienced at the so-called "impact location" directly below the overpassing bolide (although he reported being thrown 20 feet). I might otherwise suggest that Semenov experienced the compression of air due to the repulsive electric field force because the narrative description implies no time distinction between the "thump" and the moment of being thrown. The flash of heat traveled at the speed of light. But the electric field force is instantaneous, although modified by the intervening mass of air. By comparison, the following "rumble" implies a separation by a distinct time period after being thrown. (This is inadvertently modified in two instances when Semenov backtracks to add details to items mentioned earlier.)

The rumble and sound like cannons being fired or rocks falling is possibly the sound of the air compressing, expanding (from being heated), and then falling back in to fill the resulting void. These are the sounds of a large object, here a mass of air, rather than the sound from discrete locations like a thunderclap. But it is possible that these rumbling sounds were associated with the compressive impact at ground level (after all, some 60,000,000 trees fell), but I doubt that such sounds would have carried well through the intervening forest of trees for the sound to arrive as soon as is suggested by the quoted text.

Semenov experienced the heat, then a shock ("a strong thump") from the compression of air, followed by the sounds from overhead, a number of them arriving at closely spaced intervals, like "rocks were falling or cannons were firing," and then an Earth tremor from the shock experienced at ground level below the bolide ("the earth shook"). The sequence of these -- the heat, the thump or jolt, rumbling sounds, and the Earth tremor -- is correct for the mechanics described above: the radiant heat pulse traveled at the speed of light, the thump and the jolt nearly so, but would have been delayed by the mechanics of compressing air (possibly this represented a shock wave from the explosive compression propagated through the air), the rumbling sounds were generated seconds later as the air at various locations collapsed into cavitating spaces, and the Earth tremor traveled much more slowly through the ground, although faster than the speed of sound in air.

... sequence of events

What had happened here in this sequence is that the voltage of the Earth and the object had been noticed by both, and both were negative. This would result in a repulsive force between the object and the Earth, which would be experienced at each end as a compressive impulse. It is this which constituted the first loud bang, the change of the object to a flattened shape, and the appearance of a black cloud.

What happened next is that the bolide, being at a greater negative voltage (charge level) than Earth, induced a positive voltage at the surface of the Earth below the object. That would have been immediate cause for a lightning strike between the bolide and Earth in an effort at charge equalization.

If the bolide came into the Earth's upper atmosphere with a coulomb charge representing a thousand billion volts difference, then after a positive voltage was induced at the Earth's surface, there would be voltage difference of two thousand billion volts.

None of this is altogether too certain, because there are numerous variations in the parameters governing the interactions, and additionally there is considerable variation in the reporting of the event. Of the physical parameters, I should point out, for example, that the electric field of the Earth is not linear near the surface. It varies locally, although generally decreasing in negative value as Earth is approached.

How the electric field of the Earth was additionally distorted at the Tunguska "impact" location is hinted at by N.V. Vasilyev, a Tunguska researcher, who, in "The Tunguska Meteorite: A Dead-lock or the Start of a New Stage of Inquiry?" (*Tunguska International Workshop*, Bologna, Italy, 1996), wrote that the "explosions" happened directly over the mouth of an ancient Triassic volcano. This would seem to have provided an electric discharge path directly to the interior of the Earth.

When the object came within this striking distance for an arc, it was hit with a thunderbolt

from Earth. This may have been relatively close to the ground. Investigators have suggested an elevation of about 5 miles (8 km) above the Earth for the altitude at which the object exploded. This is a lot. It is likely that the thunderbolt, and apparently a number of subsequent thunderbolts (identified by local observers by their flash of light and clap), broke up and disintegrated the object. At least, so it is suggested by later researchers until more recently when a theory that the object exploded by itself, for unknown reasons, came into vogue.

... energy estimates

If it is held that the bolide exploded aurally, then the researchers have to take a completely different accounting of energy levels. The devastation at ground level now has to be accounted for by an explosion five miles (8 km) above the ground. Considering that the effect of an explosion falls off as the square of the distance, the energy level attributed to the overhead explosion would have to be set at a thousand or a million times the effect felt at ground level.

In fact, Ari Ben-Menahem, in "Source parameters of the Siberia explosion of June 30, 1908, from analysis and synthesis of seismic signals at four stations" (*Physics of the Earth and Planetary Interiors*, 1975), suggests 5 orders of magnitude (100,000 times). If the explosion occurred at a height of approximately 7.5 km, then a total energy release of approximately 3×10^{23} ergs (7,500,000 tons of TNT) would be required to result in an estimated seismic (ground level) energy of 5×10^{18} ergs (125 tons of TNT).

The same holds for the scorching of the central portion of the felled trees. The scorching heat at ground level would probably be on the order of under 1000 degrees Fahrenheit (800 degrees Fahrenheit is the ignition temperature of dry wood) and be experienced for a very short duration (there is no disagreement on these two factors), but, because of the same assumption of a radial falloff, the temperature of the overhead "fireball" has been estimated at 30,000,000 degrees Fahrenheit -- hotter than the Sun. The result is that investigators are searching for physical and mechanical explosive processes far in excess of anything that is required to fulfill the conditions that were experienced.

The mainstream scientific identification of the "impact area" was initially based on the effects of an explosive shock wave from a blast at the surface of ground zero. It assumed a trajectory for the object which would have intersected the Earth's surface at the location of the "impact site." It most likely did not. It is very likely that the object overflowed the "impact zone" and landed somewhere further afield in the northwest. If it landed at all.

[Image: Downed trees at Tunguska. Image after Leonid Kulik Expedition.]

This was understood later when no impact depression was found and no remnants of a meteor. At that time it was suggested by the scientific establishment that the object had exploded while miles above the Tunguska epicenter.

At any rate, the ground was hit hard enough to cause an earthquake estimated to be the equivalent of a 5th magnitude on the Richter scale (this was before the Richter scale was adopted). This, and the subsequent travel of a blast of superheated air, are the evidence of a repulsive electric field impact force, not of a surface impact. The downward compressive impulse would have been established instantaneously, although it would take time to compress the air and then have it blast out sideways from the center. And it let up quickly after that. It also had nothing to do with a continuation of the trajectory of the object. The compressive impulse happened perpendicular to the ground, below the object as it was traveling. The heat of the shock wave would have ionized the air enough to allow an almost immediate return thunderbolt. This may have broken the object up -- but it has also been suggested that the bolide continued to travel toward the northwest.

The high temperature wave of compressed air traveled laterally along the ground away from the center singed dead pine needles, moss, and dead branches of trees (not "burning falling trees" as Hartmann wrote). The pressure of the air expanding laterally also snapped or uprooted 60,000,000 trees (some of which were dead standing trees). Once the extent of the damage became known, new causes were sought. Thus, as mentioned, the later analysis of the physics of this event envisioned a shockwave of compressed air, generated when the

comet or meteor exploded while still 3 to 6 miles (9.5 km) above the ground.

"The spectacle that confronted Kulik [an investigator in 1921] as he stood on a ridge overlooking the devastated area was overwhelming. He saw an area where trees up to three feet in diameter had snapped like toothpicks, were uprooted and strewn across the landscape."

-- Quoted from ICR, 2019.

... observations

Wal Thornhill has provided a more coherent explanation both for the brilliance of the Tunguska object and for its catastrophic explosion, writing in an essay, "Comets & Lightning Jets" (2003):

"The meteor trail acts as a giant lightning rod that connects the conducting ionosphere to the upper atmosphere. If the earth is an electrical body in an electrical solar system, it is the equivalent of a temporary short-circuit of a giant capacitor. The current flowing along the meteor trail gives rise to the unexplained brilliance and long-lasting glows of some meteors. It causes them to disintegrate like an exploding capacitor, high in the atmosphere. The Tunguska explosion was probably the most noteworthy example of the effect."

-- at www.holoscience.com/

In Thornhill's model the "meteor trail" is likely dark, consisting only of recently ionized gases of the upper atmosphere, reaching 300 miles (480 km) up into the ionosphere. [\[note 5\]](#)

Thornhill neglects the electric field repulsive coulomb force, for this so far exceeds anything that can be imagined, that it is just beyond comprehension, despite the fact that it is inherently obvious from electrical theory. It is also obvious from the 60,000,000 downed trees. Thornhill, however, also points out:

... in an Electric Universe comets are not the apocalyptic threat to the Earth imaginatively portrayed by artists. Such pictures are entirely fanciful because a comet would be disrupted electrically by a cosmic thunderbolt before it hit the Earth. The only visible evidence remaining would be an electric arc crater."

-- Wal Thornhill

The object in the sky disappeared and nothing of meteorite fragments has ever been found at the blast zone. Traces of Iridium were noted in the impact area by later researchers. Greenland ice cores show a high level of Ammonium ions for 1908:

"Precipitation that fell on Greenland during the winter after Tunguska contains a strong, sharp spike in ammonium ions that can't be explained by other sources such as wildfires sparked by the fiery explosion, says study coauthor Adrian Melott."

-- *Science News* (2010) comments on "Cometary airbursts and atmospheric chemistry: Tunguska and a candidate Younger Dryas event" by Adrian L. Melott, Brian C. Thomas, Gisela Dreschhoff, and Carey K. Johnson, in *Geology*, (2010).

Let's clear this up: There were no "wildfires sparked by the fiery explosion" -- only the scorching of dead branches and dry moss. The same repulsive force also hit the asteroid, likely shattering it, as I have suggested, and bringing the dust to incandescence. Then, as soon as the (more) negative polarity of the asteroid was sensed by the surface of the Earth, and the Earth's surface changed to an induced positive voltage, there would have followed a thunderbolt between the Earth and the object in the sky.

In fact, there were dozens. This last act would probably further reduce the asteroid, or some portion of it, to microscopic dust. The dust is the result of the destruction of silicates in providing electrons to the thunderbolt. The electrons traveled to the Earth's surface during the thunderclap. The dust remained in the atmosphere. The dust was noticed in the night skies for the following few days, causing a reflection of light from the day side of Earth to the night side. Mount Wilson Observatory also noticed the dust -- star observations were obscured for months.

The dozens of thunderbolts were recalled as "a railway upon which dozens of trains are traveling at the same time" and "an exact likeness of artillery fire was heard: 50 to 60 salvos in short, equal intervals, which got progressively weaker." This is quoted from text presented further below. They stand out from the louder single detonations. Possibly new thunderbolts started up as the bolide traveled overhead. I do not know.

... the Chucchan brothers' testimony

What is still missing is the clear identification of a cathode or anode, although I have already hinted at these. Since no obvious gouging of soil was ever noticed at the strike point on Earth, it seems reasonable to conclude that Earth was the anode for this thunderbolt. The site was not inspected until 1921. There were reports by local hunters (who ought to know) of new depressions, holes, concavities, and changes of a bog to a lake, but these were mostly ignored by later investigators, who were still looking for evidence of objects having fallen from above and entering the ground, and who spent time excavating the holes in a search of comet fragments. None were found. But the depressions and holes were a sure sign of the identity of the point of delivery -- the anode -- of massive lightning strikes between the ground and the atmosphere.

"... by 1928 when trained observers first visited the site, they found the impact site to be

pockmarked with a series of shallow, funnel-shaped depressions of variable width but not more than four or five meters [12 to 15 feet] in depth. No meteorites were discovered."

-- W.K. Hartmann, *Moons and Planets* (1973).

Of the eyewitness reports many are contradictory, confusing, and apparently recall details out of order. But the following, a recollection by Stepan Chucchan and his brother Chekaren, from an interview by I. M. Suslov in 1926 (although not published until 1967), seems to recount the final moments of the asteroid with unusual clarity. Notice that it becomes clear that the object perhaps consisted of four separate pieces, which seem to have exploded separately (this idea has become orthodoxy in the establishment analysis, by the way). A survey of felled trees near the epicenter also suggested three or four separate explosions to later investigators, or, at least, additional surface explosions of unusual directivity. The Chucchan brothers were 20 miles (32 km) away from the epicenter, and apparently to the south or south by southeast.

*"Our hut stood on the banks of the Avarkitta. Before sunrise Chekaren and I arrived from the Dilyushmo creek, where we had stayed with Ivan and Akulina [Lyuchetkan]. We fell into a deep sleep. Suddenly we both woke up at once: someone had **jogged us awake**. We heard a whistle and felt a strong wind. Chekaren yelled to me 'Do you hear how many golden-eyes or mergansers are flying by?'"*

*"We were both still in the hut, you know, and we couldn't see what was going on in the forest. Suddenly someone **shoved me again**, so hard that I hit the hut's pole and then fell on the hot coals in the hearth. I got scared. Chekaren also got scared, caught hold of the pole. We began to yell father, mother, brother, but no one answered. Beyond the hut there was some sort of noise, we could hear how the tree-trunks were falling. Chekaren and I crawled out of our sleeping bags and already wanted to leap out of the hut, but suddenly the thunder struck very strongly. That was the **first thunderclap**."*

"Golden-eyes" and "mergansers" are ducks. The first instance of being "jogged" is likely a seismic shock (via the ground) due to the initial repulsive impact (longitudinal P-wave). The second instance, "shoved me again" would then likely be the secondary seismic waves (transverse S-wave), which travel slower than the initial (primary) waves. Both of these preceded the sound of the thunderclap since seismic waves travel faster via the ground than sound travels through the air.

Twenty miles (32 km) from the impact area, the sound of the thunderclap would have taken about 90 to 100 seconds (at approximately 0.2 mi/sec - 0.3 km/sec) to reach the Chucchan brothers, whereas movement of the ground, the "jogging" and "shoving," which preceded the thunderclap, would have arrived in about 5 seconds (at about 4 mi/sec - 6 km/sec). These seismic waves might have arrived somewhat sooner or later than I indicate here -- by half or twice the time, since the velocity depends on soil conditions, but still clearly separated from

the thunderclaps.

What is amazing is that a thunderclap 20 miles away was heard as "very strongly." That is not a normal experience for hearing distant thunder. This "thunderclap" could be the sound accompanying a first thunderbolt, but more likely it represented the concussive impulse of the repulsive force between the asteroid and the ground. The order of events remains the same: the ground movement would have been felt long before the sound would have traveled the same distance through the air and would have been heard.

*"The ground began to twitch and pitch, a **strong wind slammed** into our hut and knocked it over. I was squeezed hard by the poles [boards], but my head was not covered because the roof had split [the roof was made of hides]. There I caught sight of a terrifying marvel: The tree-trunks are falling, their needles are burning, the dried ones on the ground are burning, the reindeer moss is burning. There's smoke all around, my eyes hurt, it's very hot, I could burn up."*

Possibly the "twitching and pitching" of the ground, which followed the earlier thunderclap, represented additional seismic activity. That would seem to be indicated by the fact that the trees, as the brothers reported, were falling around them at that time.

But the fact that this second set of seismic waves (if that is what it was) arrived very late -- after the initial thunderclap -- would indicate that this was perhaps not seismic, but local. I would also not associate it with the earlier thunderclap. Probably what was recorded as "movement of the ground," accompanied by a strong wind which "slammed into the hut" and toppled it, was the arrival of the compressive air burst which spread out from the center of the "impact" area and the tumultuous vibration of falling and uprooting trees.

*"Suddenly, above the mountain, where the forest had already fallen, something started to **shine intensely**, and, I tell you, it was as if a second sun had appeared; the Russians would have said 'something suddenly flashed unexpectedly'; it hurt my eyes, and I even closed them. It resembled that which the Russians call **lightning**. And immediately there were 'agdyllan,' loud thunder. That was the **second thunderclap**. The morning was sunny, there were no thunderclouds; our sun shone brightly, as always, and here there appeared a second sun!"*

"The Russians would have said" is a cultural insertion by Chucchan, since the native Evenk and Tunga tribe members attribute thunder and lightning to spirits, not to natural forces. It also speaks to the authenticity of the interview texts.

"Started to shine intensely," shows that this was not lightning, but an arc mode plasma discharge. There have been suggestions that there were two bolides. If this is true, this would be the second bolide going to arc mode on traveling into the Earth's electric field.

Stepan Chucchan at this point states, "immediately there were loud thunder." It should be

obvious that thunder would be delayed by over 90 seconds if the object in the sky was still twenty miles away, and the flashing light was a lightning strike.

The only conclusion I could reach is that this was indeed a second bolide suddenly brightening -- the second sun -- and the "immediate loud thunder" was the report of a repulsive electric field. The repulsive force would travel instantaneously and the clap would be experienced, as Chucchan states, almost immediately. This was not a thunderclap.

If it really were a thunderclap the sound arrived far too soon. This disconnection of sight and sound for these events is confusing.

*"With difficulty Chekaren and I crawled out from under the poles and the roof. After that we saw something flash above us, but already **in a different place**, and there was loud thunder. That was the **third thunderclap**. A wind flew at us, knocked us off our feet, struck against the fallen tree-trunks."*

*"We looked at the falling trees, we saw how their tops were broken, we looked at the fire. Suddenly, Chekaren yelled 'Look up!' and pointed. I looked there and there was **lightning** again, it flashed and struck again, made 'agdyllan,' thunder. But the thump was a little less than before. That was the **fourth thunderclap**, like normal thunder."
"Now I remember well that there was one more thunderclap, the **fifth**, but it was small and somewhere far away -- there where the sun sleeps at night [in the northwest]."*

Notice that the third, fourth, and fifth thunderclaps had moved further away, with the last (fifth) in the northwest, as would be expected if the asteroid (or parts of the asteroid) kept moving after being struck by lightning. These were not explosions in the normal sense. What the Chucchan brothers saw was lightning, although others (as quoted above) reported a blazing fire, the formation of a black cloud, and flames shooting out of the cloud. The Chucchan brothers were in their hut when this happened.

If the order of these recollections is correct, then the initial "shoves" and the wind which followed with the Earth shaking, was a compressive impulse between the ground and the object in the sky. The following thunderclaps, accompanied by lightning, were likely lightning between Earth and the object. The explosion of a second bolide remains as a good possibility.

The Chucchan brothers were not scorched by the heat of the shockwave which moved past them because they were still inside their hut. A herd of 600 reindeer, belonging to the Dzhengkoul brothers, and located at about an equal distance from the epicenter was not so lucky.

"In that place the seven rich Dzhengkoul brothers in those days pastured a reindeer herd of 600-700 head. The brothers were rich. On that day, [my] father went to meet the reindeer on the Ilimpo [river] (in the north). The herd was pastured between the Kimchu

river and the Polnoty (Churgim) river. On the upper reaches of the Polnoty river there was a storehouse. There was a second storehouse at the mouth of the Cheko. There, where the first storehouse was (on the Polnoty-Churgim), there everything was burnt up. Of that storehouse there remained only ashes. The storehouse at the mouth of the Cheko was thrown over (carried away) by a whirlwind. At the headwaters of the Khushmo [river] their herd was burned, the reindeer were burnt up, only ashes remained. At the mouth of the Cheko, the reindeer lay curled up, but they didn't burn (they had been stunned and they died)."

-- L. V. Dzhenkoul, interviewed by G. P. Kolobkova, 1960, recollections of his father.

... various opinions

To begin with, an exposition from the establishment:

"The meteorite did not strike the ground or make a crater, early researchers thought the object might be a weak, icy fragment of a comet, which vaporized explosively in the air, and left no residue on the ground."

"However, modern planetary scientists have much better tools for understanding meteorite explosion in the atmosphere. As a meteorite slams into the atmosphere at speeds around 12 to 20 km/sec [25,000 to 50,000 miles per hour] or more, it experiences a strong mechanical shock, like a diver belly-flopping into water."

Oh, give me a break.

"This can break apart stones of a certain size range, which explode instead of hitting the ground. Some of them drop brick-sized fragments on the ground, but others, such as the one that hit Siberia, may produce primarily a fireball and cloud of fine dust and tiny fragments."

"In 1993 researchers Chris Chyba, Paul Thomas, and Kevin Zahnle studied the Siberian explosion and concluded it was of this type -- a stone meteorite that exploded in the atmosphere. This conclusion was supported when Russian researchers found tiny stony particles embedded in the trees at the collision site, matching the composition of common stone meteorites."

-- "The 1908 Tunguska Explosion: Atmospheric Disruption of a Stony Meteorite" *Earth Science Australia* (Internet)

Let me suggest that "modern planetary scientists" *do not* have "much better tools for understanding". **They have nothing; they have absolutely nothing to base any of their scientific opinions on** and they certainly do not have even one iota of understanding. They **are as clueless**, and continue to be so, as the Evenk and Tunga reindeer herders who swore

that the Iron Spirit Birds (the Agdy) of the Storm God were at fault. The modern planetary scientists are spouting absolute nonsense in an effort to sound like they have been talking to *their* God.

Other sources relate, about the "stony particles":

"A 1961 expedition recovered soil samples that contained small spherules believed to be part of the object. The spherules would be consistent with the idea of an admixture of small grains of non-icy 'dirt' in the dirty iceberg [a 'comet'] and their spherical shape could be the result of sudden melting during the explosion."

-- Hartmann

Here we see the Tunguska object depicted by "modern planetary scientists" alternately as an icy comet, as a rocky asteroid, or as a snowball with spherical inclusions of "dirt." [\[note 6\]](#)

As Wal Thornhill has noted in his writing (<http://www.holoscience.com> (2004)), describing some other published explanation of comets:

"The ingenuity of such nonsense is breathtaking."

Significantly, Bob Kobres (of all people!), who is well known for advocating claims that all catastrophes in history are related to falling meteors, wrote the following in an essay titled "The case of carbonaceous catastrophes":

"... sometimes the weight of opinion is tilted by the scale of an assumed phenomenon. Remember that every aspect of this event is being retrocalculated; the mass and velocity of the unmeasured object can thus be diddled to account for the gauged destruction!"

"So, if there was a release of energy beyond what was produced kinetically, its contribution to the damage could well be absorbed by postulating a more massive object or higher encounter velocity."

-- [\[abob.libs.uga.edu/bobk/caseof.html\]](http://abob.libs.uga.edu/bobk/caseof.html)

This is an astute observation, which has also been voiced by Russian researchers.

As I earlier proposed, it was a rock. But what establishment scientists entirely misread is that this rock exploded electrically -- it vaporized (or at least broke up) because of the violent fragmentation which ripped apart the lattice of the silicates in order to gain electrons for delivery as a series of thunderbolts in a contact with Earth. The Tunguska "explosion" was the delivery of a massive electric field repulsive shock, followed by a series of lightning strikes from Earth.

The whole concept of a massive repulsive electric field force is totally foreign to consensus

thinking, as it is to most catastrophists. And that the Earth would protect itself by launching a lightning bolt at the intruding object is just as unthinkable. But consideration of the physical consequences of this event argues against simplistic and completely mechanical effects.

N.V. Vasilyev made note of the peculiarities of the fallen trees without being able to clear up the enigma. He writes:

"The vector structures of the forest falling on hill-sides facing the epicenter and the opposite ones are essentially different, which is in poor agreement with the assumption of the center of generation of the blast wave located high above the earth."

"Thus, the conclusion suggests itself that along with great energy release 5.5 to 8 km above the earth, there were a number of low-altitude (maybe even right above the surface) explosions that contributed to the total picture of destruction. This seems to be sustained by other data concerning in particular the configuration of the zones of dead trees ('poles') in the central part of the area of the catastrophe and deposition of aerosols immediately after the explosion."

-- [\[omzg.sssc.ru/TUNGUSKA/en/articlese/vasilyeve.html\]](http://omzg.sssc.ru/TUNGUSKA/en/articlese/vasilyeve.html)

This terse transliteration from the Russian may require a few additional words. What Vasilyev is saying here is that the pattern of downed trees, and the ones which were left standing at the epicenter (the "poles") and on the lee side of hills, cannot be the simple result of a point source explosion 5 or 8 km above the ground. He suggests therefore that there must have been other explosions at ground level. (Others have repeatedly noted this also.)

Of course this is exactly what I have here proposed. Certainly there was a down-directed force from the object 5 or 10 km up in the sky. The downward force would have been at right angle to the surface, for it would have been due to the electric field. But this force was of such an enormous compressive magnitude that the air heated up by thousands of degrees and needed to expand sideways along the ground, and in all directions away from the center.

It was this horizontal force, parallel to the ground, that snapped trees for 15 to 20 miles (30 km) in all directions. Low areas were protected where some trees were left standing, for the shock wave passed over them. The expanding air must additionally have moved chaotically, reshaping its path in meeting minor obstructions, like trees and hillocks.

Yet, despite the addition of an explosion at ground level as required by Vasilyev, the trees did not burn. They were only superficially singed. The trees were saved by the same rapidly expanding front of superheated air at ground level which initially set their dead branches and needles on fire. The explosively expanding mass of air left a vacuum in its wake which extinguished the flames of the burning trees immediately, especially near the center where the highest temperatures would have been experienced.

... duration estimates

Vasilyev sums up the recollection of the Chucchan brothers, recorded by I.M. Suslov, and quoted earlier, as follows:

"There were five explosions, the second seeming to have been the most powerful. Light flashes followed at an interval of a few seconds and were seen at different spots of the sky. The last, fifth explosion, took place far in the north, somewhere near the Taymura river. Trees began to fall and the fire began after the first explosion, while the Evenks [their tribal name] were in their huts, the latter being thrown down."

"The data communicated by I.M. Suslov are quite detailed and enable the whole phenomenon to be estimated as lasting no less than 20-25 seconds."

Perhaps in "lasting no less" we have a Russian idiom for expressing the fact that the whole incident took very little time. But as I have pointed out, the sound of an explosion 20 miles away would not be heard for 90 to 100 seconds. That is the minimum expanse of time. And the explosions repeated five times, certainly separated long enough from each other so that the Chucchan brothers could recount the lightning and thunderclaps as distinctly separate events. The thunderclaps might indeed have followed at close intervals, but I suspect they arrived at notable intervals. Otherwise the sequence of thunderclaps, lightning, and the blazing object would not have been remembered so distinctly and specifically.

What the synopsis by Vasilyev points up is the wide range of readings which have been extracted and presented as facts for the Tunguska event. Vasilyev, in following the mainstream understanding of the event, needed to have the explosions in the sky happen in rapid sequence -- "light flashes followed at an interval of a few seconds" -- in order to conform to the notion of an "exploding comet." If an exploding comet were to detonate five times at 60 second intervals (thus taking 5 minutes) it would not have made any physical sense -- especially if this had to be understood in terms of a compressive shockwave encountered by an object falling in the Earth's atmosphere.

E.M. Drobyshevski, in "Tunguska-1908 and similar events in light of the New Explosive Cosmogony of minor bodies" (arXiv.org, 2009), insists that the sounds were heard much earlier than they would if traveling at the speed of sound in air. To quote from his text:

"One cannot exclude also multiple reflections of sound from clouds, the waveguide atmospheric effects and so on."

All the eyewitness accounts, however, insist that it was a completely cloudless sky. Drobyshevski posits a "waveguide" phenomenon, caused by a "stratified morning atmosphere" due to "morning-time warming of the ground-level air mass." To quote all of his footnote 1:

"Interestingly, the more emotional perception of phenomena (primarily of sounds) by the western eyewitnesses (on the Angara river) compared with those located to the east (upstream of the Lower Tunguska river) can be assigned to the well-known waveguide acoustic effects in the stably stratified morning atmosphere; indeed, the difference in local time between these regions is 30'- 50' [30 to 50 minutes], a noticeable headway for morning-time warming of the ground-level air mass in the east."

It is in Drobyshevski's interest to suggest a very close spacing of the thunderclaps, for it would also support a theory of the aerial detonation of a bolide. I don't think Drobyshevski knows what a waveguide is, but more important, on June 30 at 61 degrees north latitude the Sun rose at 2:30 AM (local Mean Time). It wasn't morning anymore by a long shot. The bolide struck at 7:30 AM local time. The Sun had been up for 5 hours; the Sun was already 30 degrees up from the horizon. Where does Drobyshevski live?

Perhaps by "waveguide" is meant the atmospheric reflection of massively loud sounds, such as volcanic eruptions. In AD 1883 the Krakatoa volcanic explosion was heard four thousand miles (6000 km) away. This bending and the further reflection of sound waves is not the mechanism which would shorten a series of local thunderclaps for Drobyshevski.

Also suggested by others, all in an effort to bring all of the detonations together within a very short time span, is the notion of electrophonic sound, as, for example, N.V. Vasilyev in "the Tunguska Event" (<http://omzg.sscs.ru/>). This is explained as:

"... sounds produced by direct conversion of electromagnetic radiation into audible sound. In the case of meteor-related electrophonic sounds, they are heard simultaneously with the appearance of a bright meteor."

This is true for bolides exploding (destructively fracturing) above the atmosphere, and has been reported before. This is, in fact, the propagation of the electric field -- the repulsive shock mentioned above. It does not require air as a medium; the sound is a local compression of the air, and the effect is instantaneous. But to counter Vasilyev, let's now look at some of the reports of eyewitnesses. From the *Sibir* newspaper:

"The sky was cloudless, only a small dark cloud was observed in the general direction of the bright body. It was hot and dry. As the body neared the ground (forest), the bright body seemed to smudge, and then turned into a giant billow of black smoke, and a loud knocking (not thunder) was heard, as if large stones were falling, or artillery was fired. All buildings shook."

"The author of these lines was meantime in the forest about 6 verst [about four miles] north of Kirensk, and heard to the northeast some kind of artillery barrage, that repeated in intervals of 15 minutes at least 10 times."

This text was mistranslated. Rather than ten times 15 minutes (150 minutes), I have another

translation which reads, "Ten times over the course of 15 minutes." The *Krasnoyaretz* newspaper reported:

"Kezhenskoe village. On the 17th [on the old Russian calendar] an unusual atmospheric event was observed. At 7:43 the noise akin to a strong wind was heard. Immediately afterwards a horrific thump sounded, followed by an earthquake which literally shook the buildings, as if they were hit by a large log or a heavy rock. The first thump was followed by a second, and then a third. Then the interval between the first and the third thumps were accompanied by an unusual underground rattle, similar to a railway upon which dozens of trains are traveling at the same time. Afterwards for 5 to 6 minutes an exact likeness of artillery fire was heard: 50 to 60 salvoes in short, equal intervals, which got progressively weaker. After 1.5 - 2 minutes after one of the 'barrages' six more thumps were heard, like cannon firing, but individual, loud and accompanied by tremors."

If we add up the time intervals as reported above, we have perhaps 10 or 30 seconds for the first three thumps, 5 or 6 minutes of "artillery fire," then 1.5 minutes later "canon firing." The last two were reported by the *Sibir* newspaper as artillery barrage, that repeated ten times in an interval of 15 minutes. Even with large-scale observational errors, the minimum interval seems to be 6.5 to 7 minutes, the maximum is 15 minutes.

There is more. There are confusing eyewitness accounts, confusion in the direction the bolide moved, and even on the time of day (2 or 3 pm, above). As N.V. Vasilyev wrote:

"The total combination of evidence given by 'eye-witnesses of the Tunguska fall' contains in fact information on at least two (most likely more) large daytime bolides."

... mainstream opinions

Only a few scientists are willing to voice different opinions, mostly expressed as caveats. Boris F. Bidyukov, a Russian scientist, writing in "Radioactivity Paradox: Thermo-Luminescent Method" at *Tunguska Phenomenon: 90 Years of Investigations, Conference* (1999?), states:

"The efforts of researchers of the Tunguska problem are being concentrated on solving the problems connected with the necessity to remove the contradictions resulting from a number of paradoxes. Each of the paradoxes contains some logic contradiction reflecting, as a matter of fact, the state of researches at the moment."

-- omzg.sccc.ru/TUNGUSKA/en/newse/abstracts/bidyuk2.htm

Consensus opinion, as expressed by Wikipedia, commenting on the "asteroid hypothesis," sums up the set thinking:

"The chief difficulty in the asteroid hypothesis is that a stony object should have produced a large crater where it struck the ground, but no such crater has been found. It has been hypothesized that the passage of the asteroid through the atmosphere caused pressures and temperatures to build up to a point where the asteroid abruptly disintegrated in a huge explosion. The destruction would have to have been so complete that no remnants of substantial size survived, and the material scattered into the upper atmosphere during the explosion would have caused the skyglows."

-- en.wikipedia.org/wiki/Tunguska_event

I doubt almost all of this, especially since it contradicts the eyewitness reports. But the main problem here is that all of this is fantasy -- the buildup of pressures, the abrupt disintegration, the huge explosion. There simply is no such thing as a buildup of pressures and temperatures. All of this happened, don't forget, far above the atmosphere, in a vacuum where there would be no buildup of pressure or temperature.

Within the Earth's atmosphere a pressure wave (as with temperature) is represented by a thin layer of air which precedes the falling object, but never engulfs it. That defines a shockwave. A shockwave travels with an object, it does not bump into it. There would be heat transmitted to the bottom of the supposed iceball, but ice or snow is a very poor conductor of heat (compared to the aluminum shell of a space craft on re-entry).

The Tunguska event entailed a rather simple sequence of events -- as best we can reconstruct from the physical evidence, the verbal reports, common sense, and access to electrical theories. Despite blowing down sixty million trees, the Tunguska event is not a good analog model for meteor impacts.

There are very large meteorites which have done no electric field damage to themselves. The 130,000 pound Hoba iron meteorite in Namibia, Africa, seems to have landed without even making a crater. The iron Willamette Meteorite, although both ancient and not found in situ, weighs 32,000 pounds -- as much as the semi which hauled it away. All recent meteor falls have been recovered. Most are small asteroids, the size of rocks or pebbles which could be held in the hand.

[The following image and caption is repeated from Chapter 2:]

[Image: September 15, 2007, Carancas, Peru crater. After Michael Farmer.]

I have here presented the details of the Tunguska event, including the mainstream interpretation, because this information will be used as an analogy by many people who style themselves researchers, including Richard Firestone, et alii, in an article in 2007, for an "impact" and "airblast" at the beginning of the Younger Dryas. The analogy is incorrect, both in scope (I believe) and certainly in the application of the mechanics of a volatile "comet" of watery composition exploding in the atmosphere. But, of course, to stay within the limits of establishment consensus science, the researchers have no recourse except to use these stock fairytales.

The Explosion at Chicxulub

I am including information on the Chicxulub crater and the Grand Canyon (below) to give some idea of the scope of things. Chicxulub has long been held to be caused by an extra-terrestrial object, and thus popularly understood as an "impact crater" rather than the location of the anode in an extra-terrestrial thunderbolt. Chicxulub was discussed in a previous chapter.

There are "impact craters" on Earth; but only about 200 have been identified, and only a few are genuine impact craters. The Moon, Mars, and Mercury, on the other hand, are littered with thousands on thousands of craters. Almost all of them are circular, like the Chicxulub crater, and all are the marks of electric arc contacts, which will always touch down

perpendicular to a planet's surface. But the Moon, Mars, and Mercury have no atmosphere to absorb and limit the lightning strikes.

[Image: Yucatan crater, after NASA, [N. Short, rst.gsfc.nasa.gov/Sect18/](http://rst.gsfc.nasa.gov/Sect18/)]

For the Chicxulub crater we have some estimates of the energy of detonation. For the Grand Canyon I found no such estimate. But the Grand Canyon is not recognized today as having extra-terrestrial causes, despite the fact that it certainly looks like the mark of a cathode electric arc strike.

A darkness of 1500 years -- or 1000 years as the least estimates for the Younger Dryas -- is a long time. But then, compared to a local nuclear war with an explosive effect of one hundred 15-kiloton nuclear bombs, which would conservatively cause 10 years of shadow, cold, and drought, the electric field explosion at the beginning of the Younger Dryas must have represented the effect of millions or billions of nuclear bombs. The 110-mile (175-km) diameter Chicxulub "impact crater" has been estimated to represent the explosive effect of 100,000,000 megatons (10 exp 8 megatons) of TNT (Wikipedia), equivalent to 6,000,000,000 atomic bombs. I will compare this to the "event" at the start of the Younger Dryas, further below. [\[note 7\]](#)

[Image: Chicxulub below-ground crater. The small dots are cenotes (sink holes). After Alan Hildebrand, Glen Penfield, PEMEX.]

About Chicxulub, Wikipedia states:

"The impact would have caused some of the largest megatsunamis in Earth's history, reaching thousands of feet high."

"A cloud of super-heated dust, ash and steam would have spread from the crater, as the impactor burrowed underground in less than a second. Excavated material along with pieces of the impactor, ejected out of the atmosphere by the blast, would have been heated to incandescence upon re-entry, broiling the Earth's surface and possibly igniting global wildfires; meanwhile, enormous shock waves spawned global earthquakes and volcanic eruptions."

"The emission of dust and particles could have covered the entire surface of the Earth for several years, possibly a decade, creating a harsh environment for living things to survive in. The shock production of carbon dioxide caused by the destruction of carbonate rocks would have led to a sudden greenhouse effect. Over a longer period of time, sunlight would have been blocked from reaching the surface of the earth by the dust particles in the atmosphere, cooling the surface dramatically."

The aspects of "global earthquakes and volcanic eruptions" relate to a compressive impulse at an unknown location, directly before the thunderbolt. But there is something to be said for the dust, although this too would likely be due to the compressive forces, rather than the arc,

and is rather severely downplayed here. Soot from forest fires would have been lofted into the stratosphere to block sunlight, for much longer than "several years, possibly a decade" -- probably for thousands of years. This was certainly not a "greenhouse" condition.

Sean Carroll, in *Remarkable Creatures* (2009), a book on natural history, writes the following imaginative scenario in describing the Chicxulub crater in the Yucatan. It is but one sample from thousands of science writers. Carroll is a molecular biologist.

"The asteroid crossed the atmosphere in about one second, heating the air in front of it to several times the temperature of the sun."

And that is only the first sentence.

The asteroid here is coming in from directly above, perhaps so that it can make a circular hole in the ground. That is actually hard to do. The air in front of the asteroid does not heat up to "several times the temperature of the sun." The shock front temperature is not easily described from theoretical considerations, or even amenable to thermodynamic modeling. However, there is a rule-of-thumb that holds that the temperature in Kelvin can be numerically approximated by the entry speed in meters per second. As I will develop in more detail later, entry temperatures of spacecraft or bolides may rise to 7,000 Kelvin or could perhaps be as high as 70,000 Kelvin. The lower temperature is only slightly higher than the surface of the Sun (5600 Kelvin). The higher temperature is only a small fraction of the temperature of the Sun's chromosphere, which experiences temperatures of 2,000,000 Kelvin.

So where does this statement come from? I suspect it was copied from all the other literature which attempts descriptions of the Chicxulub crater. Have any of the hundreds of science writers ever checked the sanity of this, or have they all forgotten high-school physics? Here the imagination has completely overwhelmed common sense. The sense of enormity is there, but the physics is absent.

What Carroll actually meant to do here is to give us a measure of the kinetic energy dissipated on impact, some of which might result in very high temperatures, although of very short duration. At least, that is what is assumed, since no evidence of an impacting object has ever been found, suggesting that it vaporized, as for example at the 3/4-mile (1.2-km) diameter Barrington Crater in Arizona (today called "Meteor Crater").

That is not to say that there could not be some overwhelming impacts, since the kinetic energy increases linearly with the mass of the bolide. But calculating backward from craters where no meteorite was found and then assuming it vaporized, will only lead to seeding parameters of formulas which have no claim to reality. These calculations will determine the energy needed to turn a rock into a gas. Notice that here the energy is the result of an impact, not due to a "shock wave" hitting an iceball. Carroll continues:

"On impact, the asteroid vaporized, an enormous fireball erupted into space, and rock

particles were launched as far as halfway to the moon. ... Farther away, matter ejected into space fell back to the earth at high speeds -- like trillions of meteors -- heated up on reentry, and ignited forest fires across continents."

He then points up the darkness which would result, but like everyone else, the effect is minimized: "The debris and soot in the atmosphere blocked the sun, and the darkness may have lasted for months." How can a period of months account for the demise of every creature larger than a few hundred pounds? The thinking about blocking sunlight is of course influenced by the only slim facts at hand: the climatic effect after the 1883 eruption of Krakatau in Indonesia. The skies darkened worldwide for a few years (Wikipedia), yet the Krakatau eruption represented only the smallest fraction of the Chicxulub impact. As noted above, Bobcock and Toon have pointed out that volcanic eruptions produce sulfate clouds which enter and remain in the upper atmosphere for some time, but do not rise into the stratosphere. Recent estimates of the time it took for the deposition of the K/T boundary layer, based on Helium-3 content, suggest 10,000 years. That is, it took about 10,000 years for the dust, soot, and atomic products cast up into the atmosphere and stratosphere to settle out -- not "a few months."

As I have pointed out in a previous chapter, despite the consensus opinion that the Chicxulub "crater" was caused by a meteor, I will hold that this and a number of related contacts (at the same time) were electrical. The Chicxulub crater, with its smaller peripheral depressions, the cenotes, represents the Earth as the anode of an absolutely massive thunderbolt. There are exact models of this, complete with on-edge perforations, on the Moon.

The Scar of the Grand Canyon

[Image: East end of the Grand Canyon of Arizona. After Google Maps.]

I have included a few images of the Grand Canyon. These will perhaps convince the reader of the magnitude of the scar of the Grand Canyon, and the forces which might have created it. In the text further below I have some estimates of the energy involved.

We have no clear creation date for the Grand Canyon, only from adjacent lava flows some estimates of about 600,000 years ago -- at the latest. I initially thought that the Grand Canyon might represent the location of an arc following the compressive slam over the Laurentide Ice Sheet, but the dates and other facts cannot be matched.

"... geologists are divided into two warring camps. They both agree that the Grand Canyon is young, geologically speaking. The evidence has been building since the 1930's and 1940's that the Colorado river did not flow out of the Canyon nor across the ridges and valleys of Nevada/California before 5.5 million years ago."

"The first camp thinks that a proto-canyon completed most of the excavation of the Canyon first. Later, the Colorado river flowed into this pre-existing proto-canyon. The second camp says evidence for a proto-canyon is inadequate, and the whole canyon was carved quickly."

-- Amy Acheson "Grand Canyon Revisited" (*Thoth VII*, 2003)

[Image: Grand Canyon. Courtesy of Bob Ribokas, kaibab.org.]

Both Juergens and Thornhill have suggested the Grand Canyon is the scar of a massive lightning strike, where Earth was the cathode (thus Earth was the source of electrons). Much of the damage, Thornhill notes, was probably a below ground lightning response to the initial contact. A very equivalent scar on Mars, the Valles Marineris, is nearly 3000 miles long (4800 km), ten times the size of the Grand Canyon. But Mars had no atmosphere. The Earth's atmosphere would moderate an approaching thunderbolt despite the fact that this came from another planet. If it came from Saturn, the thunderbolt came from a planet 10 times the diameter of Earth and with a mass 300 times that of Earth.

On the basis of suggestions for the excavation time for the Valles Marineris (by others), I would suggest that the Grand Canyon was excavated and the material lofted up in less than 10 minutes. The thunderclaps would have echoed around Earth a number of times. The ground at the eastern end swelled and raised up, as is typical of cathode marks and can be identified as the point of initiation of the strike, making it look today as if the Colorado river flowed uphill in carving out the depression.

The Grand Canyon was the result of a cathode electric arc strike. The lightning at the start of the Younger Dryas was a series of anode strikes, actually much larger than the 220-mile (350-km) scar at the Grand Canyon and much more contained.

Where did all the excavated material go? Some probably fell back to Earth. Much of that fell away from the Canyon, as it similarly has on Mars, for it would be ionized and electrically repelled from the location of the electric arc contact. I suspect that much was simply turned to dust and is indistinguishable today from desert sands. If we go on the basis of information which I will present later, we could expect trajectories on the order of 500 to 1000 miles

(1600 km) for the removed soils. An enormous amount of dust would have entered the atmosphere, initially causing endless rains -- rains like those which the *Popol Vuh* claims dissolved the first generation of humans, the mud people. But the rains of the *Popol Vuh* date to the start of the Younger Dryas. There were no humans of our sorts 600,000 years ago, the youngest date for the Grand Canyon.

Ionized silicates and fine dust in the Earth's atmosphere might have formed the initial portion of the conducting conduit for a return lightning stroke directed at Saturn or Mars. A massive amount of nanometer particulates ended up in the stratosphere, matter especially from the fires. Such fires are recognized today by mainstream scientists, as in the recent journal papers of Richard Firestone, et alii.

The Great Lakes detonation

The tale of the cometary explosion over the Laurentide Ice Sheet in 10,900 BC started with a report on the production (in antiquity) of odd nuclear atomic particles in the state of Michigan. This was detailed in a 2001 article by Richard Firestone and William Topping, "Terrestrial Evidence of a Nuclear Catastrophe in Paleoindian Times" (*Mammoth Trumpet Magazine*, 2001). The introduction reads [reparaphrased, abbreviations expanded]:

"Our research indicates that the entire Great Lakes region (and beyond) was subjected to particle bombardment and a catastrophic nuclear irradiation that produced secondary thermal neutrons from cosmic ray interactions."

"The neutrons produced unusually large quantities of Plutonium-239 and substantially altered the natural uranium abundance ratios (Uranium-235 / Uranium-238) in artifacts and in other exposed materials including cherts, sediments, and the entire landscape. These neutrons necessarily transmuted residual nitrogen (Nitrogen-14) in the dated charcoals to radio-carbon [Carbon-14], thus explaining anomalous dates."

[Image: The Great Lakes shown as puddles at the edge of the melting Laurentide Ice Sheet; 12,000 BC and 7,000 BC. After U.S. Army Corps of Engineers.]

Firestone and Topping reported on dates from the Great Lakes region (Michigan, Illinois, Indiana, and lower Ontario), plus two sites in New York and Pennsylvania, a site in New Mexico, and one site northwest of Hudson Bay. They noted that the dates are inconsistent with much earlier dates of 32,000 BC in South America, which have become accepted since 1990. They write:

"... at the Gainey site in Michigan a 2880 bp radio-carbon [Carbon-14] date was reported, while the thermoluminescence date for that site is 12,400 years before the present. Other anomalous dates found at Leavitt in Michigan, Zander and Thedford in Ontario, Potts in New York, Alton in Indiana, and Grant Lake in Nunavut [northwest of Hudson Bay] are summarized in Table 1 [not shown here]."

"The Grant Lake Paleoindian site is most remarkable because its 160 radio-carbon years before the present age is nearly contemporary, while adjacent and deeper samples give ages of 1480 - 3620 radio-carbon years before the present."

After considerable details on Uranium 235/238 ratios, Plutonium, particle tracks in tool-grade chert (Clovis spearpoints), and excess Carbon-14 (levels above the present) -- all claimed to be due to an influx of neutrons from outer space -- the authors conclude that radio-carbon dates for the sites in Michigan, and by extension elsewhere, should be moved far into the past. That is a rather amazing and sudden backtracking for archaeology in the U.S.A.

"The 39,000 years before the present date proposed for the Gainey site is consistent with the prevailing opinion among many archaeologists about when the Americas were populated. It is also commensurate with dates for South American sites and with a Mousterian toolkit tradition that many see as the Paleoindian precursor. ... Since the Lewisville and Meadowcroft sites were likely exposed at the same time to thermal neutrons, we estimate that their dates should be reset to about 55,000 years before the present and about 45,000 years before the present, respectively."

Wow! This is a dramatic redefinition of the Indian occupation of America, something which had long been held to 12,000 BC by the North American (U.S.) archaeological community. But there is more.

The authors next suggest a "cosmic ray bombardment" from a supernova as the cause for the influx of particles and the altered radioisotopes (plus excess isotopes or elements of Beryllium, Calcium, and Magnesium in the Greenland ice cores for 11,000 BC). "Cosmic rays" are primarily high-energy protons.

"The geographical distribution of particle tracks, Uranium-235 depletion, and Plutonium-239 concentration ... are quite consistent, although the particle tracks seem to be confined to a smaller geographic area. They indicate energy released over the northeastern sector of the U.S., with maximum energy at about 43 degrees N, 85 degrees

W, the [Lower] Michigan area of the Great Lakes region."

This last would seem to indicate a very focused source of a limited diameter, even though any "cosmic ray bombardment" from afar (as suggested by the authors) would, in fact, cover a much larger circular sector of Earth before the impinging rays were no longer near vertical -- probably 25 to 30 degrees of the circumference of Earth, an area with a diameter of 2000 miles (3000 km). This is a very strange discrepancy: the external "nova event" would cover a very wide area, while the actual data is found primarily in an area of a very limited diameter - less than 200 miles (300 km).

To resolve this, that is, the fact that "particle tracks seem to be confined to a smaller geographic area," the authors imagine an additional local aerial explosion above the "smaller geographic area" -- in fact, above Lower Michigan. This becomes and remains the second causal conditions for the Younger Dryas event, the first being the incoming radiation from a supernova. There is just no other solution but to suggest two different distribution systems. This is, of course, exactly what the electrical cause for the event will also claim, but for clear reasons.

The authors conclude with a recounting of the "devastating effect on Earth," in particular the continent-wide effects, writing:

"The enormous energy released by the catastrophe at 12,500 years before the present could have heated the atmosphere to over 1000 degrees Centigrade over Michigan, and the neutron flux at more northern locations would have melted considerable glacial ice. Radiation effects on plants and animals exposed to the cosmic rays would have been lethal, comparable to being irradiated in a 5-megawatt reactor more than 100 seconds."

Then there follows a comment which is very interesting. It is known that grain cultivation was started worldwide in about 9000 BC, at the end of the Younger Dryas, when the climate improved again. The sudden appearance of maize is noted in the Maya *Popol Vuh* also.

"Massive radiation would be expected to cause major mutations in plant life. Maize probably evolved by macro-mutation at that time, and plant domestication of possibly mutated forms appears worldwide after the Late Glacial period. For example, there was a rapid transition from wild to domesticated grains in the Near East after the catastrophe."

The date for the first appearance of maize is about correct. It shows up in about 8000 BC in Central America. The authors also suggest that the history of the retreat of the Laurentide Ice Sheet, which had already experienced 2000 years of warm weather, should be revised:

"The modified dates for Paleoindian settlements suggest that the timetable for glacial advance sequences, strongly driven by conventional radio-carbon dates, should be revisited in light of the evidence presented here of much older occupations than

previously thought."

This position will be modified later. In the paper of 2007, it serves the authors (plus 23 additional authors) better to leave much of the Laurentide Ice Sheet intact -- as a landing site for a comet or comets, and in order to shove ice into the North Atlantic and initiate a thousand years of cooling.

Before leaving this topic, I should present a selection from a statement by Topping, addressing criticism ("comments") aimed at the original article in the *Mammoth Trumpet Magazine* quoted above:

"Since the inception of the investigation, the Principal Investigator [William Topping] has regarded a 'solar flare' as direct cause for the clear pattern at about 12,500 years before the present as recorded in ice and marine data, Paleo-Indian radio-carbon dates/artifacts and associated extinctions and mutations, and also sediments at depth, simply because the overall pattern suggests an 'event' of less than about 24 hours duration with primary observable effects consistent with the rotation of the earth in respect to the sun."

But he admits that Firestone's thesis may also be correct:

"Firestone may be correct in hypothesizing a supernova, and there are other possibilities as well."

It is, of course, the "other possibilities" which I am proposing here -- that the whole of the altered isotopes could be caused directly by a series of absolutely stupendous lightning strikes following the initial compressive impulse. And more. The bolts should have done damage far in excess to what is seen today at the 240-mile-long (380-km-long) gouge of the Grand Canyon.

I should also mention that his suggestion of effects "consistent with the rotation of the earth in respect to the sun" do not add up, neither for the authors nor for me. For the researchers, whatever happened over Hudson Bay, should have been followed by effects further west. But instead, it looks like there were almost simultaneous "explosions" over the Great Lakes. In actuality even less of it makes sense when the Carolina Bays on the Atlantic coast are factored in -- a topic I will cover in a following chapter.

In my sequence of events, the site of activity first moved south and east to Lake Ontario -- thus seemingly against the direction of the rotation of the Earth. This can be done if it is admitted that when the Earth was slammed near the time of the spring equinox, the Earth's rotational axis would be pointed in the trailing direction of the Earth's orbit. Tilting the axis away from the source of the impact would move the perpendicular direction to the exterior planet directly southeast to Lake Ontario.

The effect would be to have the Great Lakes move eastward by about a half time zone. The resulting gyroscopic reaction torque would then move the remainder of the Great Lakes toward the east also at considerably more speed than the normal rotation of the Earth would accomplish.

Endnotes

Note 1 --

The Younger Dryas affected different areas of the world unequally and out of sync. South America cooled far too early to match the supposed influx of meltwaters from the North American glacier into the North Atlantic, which today is held as the cause for the cooling in Northern Europe. The Arctic and far southern region of South America were less affected, as also the tropics. This suggests that the darkness was climatically distributed over the Earth.

In fact, the "disruption of the Gulf Stream," due to the supposed influx of North American meltwaters, is today dated to about 6200 BC, and lasted a thousand years, thus to 5200 BC. These dates are well after the end of the Younger Dryas. The disruption of the Gulf Stream probably represents a tidal system rotating around Earth in the North Atlantic and North Pacific as Earth drew closer to Saturn, but still positioned off center from the south pole of Saturn. This would have disrupted the northern end of the Gulf Stream. A thousand years later (5200 BC) it was over; Earth had repositioned to more or less directly below Saturn, although I have identified this as 5800 BC.

Note 2 --

Any charged object in space will attempt to isolate itself from external electric fields by forming a plasma "double layer" at the outer edges of its plasmasphere, which will isolate its own electric field from the exterior field. The largest voltage drop will be between the exterior field and the field at the interior of the plasmasphere. This boundary is called the "double layer." The double layer consists of an interchange of positive and negative ions drifting back and forth across the boundary between the exterior and interior electric field. Inside the plasmasphere there is very little voltage difference until the surface of the planet (or comet) is reached.

This is actually a very efficient means of isolation. The double layer will reconstitute itself as charges move across the voltage boundary. Similarly, the very low voltage drop inside the plasmasphere will keep like-charge ions separated, and thus maintain the low-voltage gradient.

The edges of the Earth's plasmasphere, where the double layer exists, are located some 10 to

20 Earth diameters away from Earth, thus 80,000 to 160,000 miles (250,000 km) away from Earth. (The Earth's diameter is 8000 miles, 13,000 km.) When the plasmasphere double layer is constituted, the Earth would be invisible to the electric field of Saturn, even if all of the Earth were within Saturn's plasmasphere. Gravity sees through a plasma double layer, and thus keeps the Earth from escaping to outer space.

Note 3 --

Mel Waskin, in *Mrs. O'Leary's Comet* (1985), has some comments on Tunguska. He writes:

"Since the tail of a comet always points away from the Sun, this comet's tail had to have been extended toward the west [the Sun being in the southeast at 7:30 am]. It would then be at right angles to the path of the comet's head as it entered the Earth's atmosphere. The tail would stretch westward from Siberia more than a thousand miles across Europe, producing the brightness that amazed everyone on those June nights in 1908. The tail would drift high above Earth, unable to penetrate the atmosphere."

This is all a fantasy, woven into a narrative in the imagination, and not even correct. The Sun was in the east (not the southeast) at 7am in the morning (it rose in the northeast at 2:30 AM), so that the supposed tail would actually be more or less in line with the direction of travel -- if the tail could have been seen at all. Waskin assumed that this tail was made up of "ices" so as to reflect sunlight, and only a thousand miles (1600 km) long, rather than the typical comet plasma tail which ranges to 100,000,000 miles (160,000,000 km).

The actual tail was described by observers as a "tube." It would have been formed by the shadowing of the Earth's electric field, so that the Sun at this point has nothing to do with the direction of the tail. Within the plasmasphere of the Earth the tube would point straight up from the bolide.

At least, that was my initial interpretation. But there are many observations of a tube extending from Earth up to the location of an explosion in the sky. These are usually neglected by most researchers except those inclined to UFOs and extraterrestrials with underground bases in Siberia. See for example the writings of the Russian Valery Uvarov, at [\[www.bibliotecapleyades.net/ciencia/esp_ciencia_tunguska09.htm\]](http://www.bibliotecapleyades.net/ciencia/esp_ciencia_tunguska09.htm). Uvarov quotes as a source G. K. Kulesh, who was an observer at a weather station in Kirensk, about 460 kilometers from the site of the Tunguska explosion:

On 30 June an unusual phenomenon was observed to the northwest of Kirensk that lasted roughly from 7.15 to 8 am. I did not see it myself, as I sat down to work after recording the reading of the meteorological instruments. This is what occurred (I give the gist of what those who witnessed it said).

At 7.15 am, a fiery pillar appeared to the northwest, about four sagens [over 8 meters]

in diameter in the shape of a spear. When the pillar disappeared, five strong brief bangs were heard, like cannon shots following quickly and distinctly one after another. Then a dense cloud appeared at that place.

We would have to conclude that the return thunderbolts in these instances consisted of plasma fireballs rising from the Earth, which even today are at times seen with a tubular form directed out of the Earth. Forms like this, but on a much smaller scale, have been seen at the location of genuine crop circles (See a later chapter for this). Uvarov also wrote:

"The reports of researchers and explanations of scientists speak of a single Tunguska object. Yet the eyewitness accounts of the event itself and the evidence gathered by researchers stubbornly indicate that there were several objects in the sky, following different trajectories from different directions, but most significantly moving slowly, parallel to the Earth's surface, sometimes stopping, changing course and speed -- in other words, maneuvering -- which entirely excludes the suggestion that the objects seen were comets or meteorites.

Since electric fields propagate instantaneously, the Earth would sense the field of the approaching bolide as soon as the foreign field reached a certain threshold value.

Note 4 --

It generally takes the time period of the death of the old guard before concepts admitted to orthodoxy are dropped. Meanwhile their graduate students and press release people sort of cover up the facts to make them conform to the mainstream consensus of an era, even when they make absolutely no sense.

As an example, this is an anecdote which appeared in *Aeon Magazine* a number of years ago (1998) under the title of "Solar System Studies" by Fred Hall:

"While we have never viewed asteroids and meteoroid swarms up close, we now have space probe data on comets. First a probe was renamed ICE and run through the tail of the Giacobini-Zimmer comet with interesting results. The immediate NASA report was 'no dust, a maelstrom of electromagnetic effects and a need to completely rethink our approach with regard to cometary theory.'"

"In about a week this was changed to 'less dust than expected and a somewhat surprising amount of electromagnetic effects.'"

"In about a month the news was further refined to 'the comet was a dirty snowball as had been foreseen by accepted theory.'"

Something of a similar shift in reporting happened with the reporting on the probe "Deep

Impact" aimed at comet "Tempel-1" for an impact on July 4, 2005. I gathered press on "Deep Impact" on July 4, 2005, and at two weeks, two months, two years, and five years later. The last instance was after new images had been taken of the impact site which showed nothing although NASA claims otherwise. See the Appendix "Deep Impact."

[\[return to text\]](#)

Note 5 --

See also a summary of expected activities for the event at [\[www.thunderbolts.info/tpod/2006/arch06/060202tunguska.htm\]](http://www.thunderbolts.info/tpod/2006/arch06/060202tunguska.htm) and [\[www.thunderbolts.info/tpod/2006/arch06/060203tunguska2.htm\]](http://www.thunderbolts.info/tpod/2006/arch06/060203tunguska2.htm). These basically conform to what is being presented here. I did not run into these until after writing up the information on Tunguska based on the eyewitness accounts which I had collected. These two descriptions also treat plasma as if it is a fluid being poured onto the Earth, and various effects happen within this. Electric field forces are entirely neglected.

[\[return to text\]](#)

Note 6 --

Ted Bunch, one of the co-authors of the 2007 paper by Firestone, et alii, notes the following in an email to Leroy Ellenberger, and forwarded by Leroy on April 13, 2010, *"None of the typical shock criteria are found, although magnetic spherules, Iridium-rich fraction, carbon melt spherules, and nanodiamonds are found at Tunguska."*

The next chapter will point up the uselessness of most of these particles as data. -- they point nowhere in particular. Off the point of this endnote although relevant to a later discussion, he also wrote, about the fires at Tunguska, *"No crater, but intense and directional short lived fires (flash heating). ... Computer simulations (Sandia Labs) suggest that if the gaseous jet from an aerial detonation hits the ground, the upper few millimeters may be melted/vaporized as well as flash heating of all vegetation."*

I don't doubt any of this, except for "the gaseous jet," that is just an insane fantasy, especially in the use of the definite article. The original idea of the gaseous jet scenario can be attributed to a Russian investigator, A.E. Zlobin, in 1989.

[\[return to text\]](#)

Note 7 --

A blast of 10 exp 8 megatons of TNT was the original estimate of Luis and Walter Alvarez before the Chicxulub crater was identified. It represents the dissipation of the total of all of the kinetic energy of a large incoming bolide of a diameter considerably smaller than the 110-mile (177 km) diameter Chicxulub crater.

The Laurentide Ice Sheet

Having introduced some radically different archaeological data for Lower Michigan Clovis spearpoint sites with the 2001 article by Firestone and Topping, the team reinforced itself by adding 23 additional authors, and in 2007 published, "Evidence for an extraterrestrial impact 12,900 years ago [10,900 BC] that contributed to the megafaunal extinctions and the Younger Dryas cooling." The effect -- many authors, many disciplines -- was a bombshell, despite the terseness of the paper.

The demise of the Laurentide Ice Sheet, as presented here, will follow the research and published paper of Richard Firestone and 24 other authors, presented in 2007. Although very brief, this paper will invoke the Tunguska event as a model; I will invoke interplanetary electric phenomena. The results are almost the same and indistinguishable, except for a matter of scale. And, of course, I will also hold that the 1500 years of extreme cold of the Younger Dryas was the direct result of a darkness caused by the soot of the continental fires which drifted into the stratosphere and blocked sunlight.

Firestone, et alii, will waffle, blaming the cold of the Younger Dryas at some point to the traditional theory of a "shutdown" of the Gulf Stream, as well as the stratospheric soot which blocked sunlight from reaching the surface of the Earth, but with much less emphasis on the last, with the weasel words of "these mechanisms tend to be short-lived". So, although an absolutely overwhelming catastrophe is proposed, completely obliterating all life in North America (no humans are seen in North America for the next 1000 years) and affecting almost all of the Earth, the description of damages is seriously curbed. Placing blame with the Gulf Stream "shutdown" is a throwaway comment, as I have pointed out in the previous chapter.

Only in a few instances do the authors suggest the absolutely tremendous magnitude of this catastrophe. I will do better and propose forces large enough to have shoved the Rocky Mountains off the nearby central plains. This last item is a substantial difference between my

suggested course of events and the geological analysis by Firestone, et alii.

[Image: Laurentide Ice Sheet at circa 14,000 bp; after N. Short, rest.gsfc.nasa.gov (2008)]

I have little trouble with their archaeological, chemical, and radiological analysis, except in the insistence by the researchers on intergalactic sources. The effects of the strange event at the start of the Younger Dryas are certainly within the range of expected phenomena due to an electric field interaction. The difference is primarily in the causes, but I can also much more clearly match the expected results with the scope of the data, and do so without engaging in ad-hoc qualifications to a basic and sound theory. I am using a predictable interaction between two planets when their plasmaspheres touch. It is a model developed in some detail in the 1970s, based on plasma theory developed in the early and mid-20th century, which in turn derives from the electric field theory of classical physics of the 19th century. All of the theory is still in active use today.

On the other hand, the work of Firestone, et alii, is awash in doubt when it comes to causes. This is especially to be seen in the book by Firestone, Allen West, and Simon Warwick-Smith, *The Cycle of Cosmic Catastrophes*, published in 2006. Nothing fits properly, so that there are claims to a strange collection of imagined causes. These include, starting from the initial suggestion of a neutron bombardment (2001), the following: a nearby supernova of some star (2001 and 2006), a coronal mass ejection by the Sun (2003), a comet or series of comets of unusual composition, which have included "burned out" comets, frozen dustballs "fluffier than snow," and meteors composed largely of carbon or of glass (variously in 2006 and 2007). In each case an incoming bolide explodes high above the Laurentide Ice Sheet and the Great Lakes, and perhaps penetrates the Laurentide in the Hudson Bay region. Meanwhile, Lower Michigan turns radioactive (as detailed in the previous chapter), as

happened also to the six-inch-thick layer of black algae which seems to have covered North America almost from end to end after the start of the Younger Dryas.

The data certainly cannot be ignored, and much of the processes resulting in these data, as laid out by Firestone, et alii, are certainly expected to be correct, but the ultimate causes are not, especially when they are based on the analogy of Tunguska, which is hardly properly understood today, even after the hundreds of Russian investigations. I will claim, for the start of the Younger Dryas, a very simple electric field interaction with one of the planets below Saturn. The establishment researchers claim rather a "very unusual comet" (their words) which exploded in an air blast and left no mark except for dropping tiny diamonds (nanodiamonds), magnetic iron pellets, fullerenes (buckyballs, mostly of Carbon-60), and carbon glass (Carbon-Oxygen forms). Almost all of these forms might be produced with the stupendous electric field compressive impact over a very large area, and the resultant flash of stupendous heat. But all of these molecular forms are perhaps easier created by massive electric arcs although for some of the data (particles or chemistry) I may have to invoke an atmospheric transfer from the Saturnian planet via its double layer.

The abstract of the 2007 paper by Firestone and others reads in part, [abbreviations expanded]:

"A carbon-rich black layer, dating to 12.9 thousand years ago, has been previously identified at 50 Clovis-age sites across North America and appears contemporaneous with the abrupt onset of Younger Dryas cooling. The in-situ bones of extinct Pleistocene megafauna, along with Clovis tool assemblages, occur below this black layer but not within or above it."

"In this paper, we provide evidence for an extra-terrestrial impact event at 12.9 thousand years ago, which we hypothesize caused abrupt environmental changes that contributed to Younger Dryas cooling, major ecological reorganization, broad-scale extinctions, and rapid human behavioral shifts at the end of the Clovis Period."

I'll take a check on the "human behavioral shifts." I would think that any human who witnessed the "crushing impact" would be dead, incinerated, and reduced to a vapor. In fact, the archaeological record draws a complete blank for all of North America for the next thousand years after this date. Humans came back, apparently from Central America and the Caribbean where they survived, and first show up in the Southern United States after about 600 years. They returned with a spear blade technology known as the "Folsom" point -- smaller, but based on the earlier large fluted "Clovis" points. This is the behavioral shift. The really large and sharp detachable Clovis points were no longer needed; big animals everywhere had disappeared. The smaller Mexican buffalo had started to migrate up into the North American grasslands.

The second point made by this paragraph, "changes that contributed to Younger Dryas cooling," I would also take exception to, especially in the light of the 2010 article in

Scientific American by Alan Bobock and Brian Toon, "Local Nuclear War, Global Suffering," discussed in the previous chapter. There can be little question that an "event" which burned down the entire North American continent would have caused a massive downturn in temperature because sunlight was blocked from reaching the surface of the Earth for a very long time.

"Clovis-age sites in North America are overlain by a thin, discrete layer with varying peak abundances of (i) magnetic grains with iridium, (ii) magnetic microspherules, (iii) charcoal, (iv) soot, (v) carbon spherules, (vi) glass-like carbon containing nanodiamonds, and (vii) fullerenes with extra-terrestrial helium [within Carbon-60 spheres], all of which are evidence for an extra-terrestrial impact and associated biomass burning at 12.9 thousand years ago."

Not mentioned is that the black layer includes the remains of freshwater algae. Directly after the impact it rained and rained and rained. For the authors the magnetic spheres, carbon-glass, nanodiamonds, and fullerenes are signs of extraterrestrial origins, although these carbon forms also regularly show up in rocks which have been struck by lightning, just as fullerenes are found in the soot from fires. These forms are also associated with meteorites. This is to be expected, since meteorites, as with asteroids, are but the broken remnants after interplanetary lightning strikes. [\[note 1\]](#)

"This layer also extends throughout at least 15 Carolina Bays, which are unique, elliptical depressions, oriented to the northwest across the Atlantic Coastal Plain."

As they make clear elsewhere, the "layer" **does not extend throughout** the Carolina Bays. Some of the peculiar carbon particles, mainly carbon-oxygen glass, appear randomly (and sparsely) mixed with the sands of the Carolina Bays. The Carolina Bays, a designation for a landform occurring throughout North America (but not elsewhere), is the touchstone for this disaster. These are oval shaped deposits of fine sands in sheets 6 feet to 30 feet thick, placed on older strata, with raised edges enclosing pools of water. The Carolina Bays will be addressed further below. [\[note 2\]](#)

"We propose that one or more large, low-density extra-terrestrial objects exploded over northern North America, partially destabilizing the Laurentide Ice Sheet and triggering Younger Dryas cooling."

Of course I disagree with the "explosion" of a "low-density" "extra-terrestrial" object, but notice that the effects are almost the same. The exploding object, even if large, would represent a compressive force radiating out from a point source, although rapidly lessening in effect away from the location directly underneath the overhead explosion. Since an aerial detonation is spherical in the distribution of force, the effect will fall off as the square of the distance from the exploding center. The fall-off is very considerable. This fact completely contradicts the data obtained by the Firestone group, but is glossed over.

There are serious questions (admitted also by the researchers) of what this "exploding object" would be made of, and how it would blow up. The traditional model (supposedly) for this is the uneven expansion of a rocky object (meteor) as it heats up due to air resistance. But our experience of breakups of meteors is that these happen high up in the stratosphere where there is little air resistance. We seldom hear the sound of meteor explosions.

As I have already suggested for Tunguska, the breakup and explosion happened because of the electric stresses at a molecular level experienced as the rocky object entered the Earth's electric field. It exploded electrically.

The researchers, perfectly aware of the problems associated with suggesting that a meteor blows up (for whatever reason), have instead selected a "comet" as the incoming object -- as if this would make a difference. This will do as a fantasy object, since we have never seen or experienced a snowball comet entering the Earth's atmosphere. Personally, I simply cannot imagine what would happen to such an object on approaching closer to the Earth, even if there were such things as frosty iceball comets.

This is where the researchers fall back on the traditional "air resistance" model. The snowball or iceball will explode, it is insisted upon, because it is being heated up. So the authors proceed with an "icy comet," which is flash-heated so that all the ice or water expands into steam -- suddenly. On expansion the ice or water of the comet turns to steam which takes up 1500 times the volume that the water or ice originally occupied. It might be likened to a steam boiler exploding, without the boiler or the buildup of pressure.

It is thus assumed that the "mountain sized" snowball entered the atmosphere at perhaps Mach 25 (7 kilometer/second, 15,000 mph). For an object entering the atmosphere at such a speed, heat is produced by compression of the air and a simultaneous rise in temperature at a shock front directly ahead of the object. The heat is not due to friction, but caused by the compression of atomically disassociated (ionized) air.

Would this melt the snowball? Wikipedia, under the heading of "Shock layer gas physics" ("Atmospheric Reentry"), reads:

"An approximate rule-of-thumb used by heat shield designers [of returning satellites] for estimating peak shock layer temperature is to assume the air temperature in kelvin to be equal to the entry speed in meters per second - a mathematical coincidence."

At 7 kilometer/second (7000 meter/second), the shock front would develop a temperature of 7000 Kelvin in contact with the leading edge of the mile-wide snowball or iceball. A temperature of 7000 degrees is about what a space entry vehicle experiences at its heat shield. But the maximum entry speed might be as high as 70 kilometer/second, suggesting a temperature of 70,000 Kelvin at the shock front (although such a speed would be very unlikely).

The heated air, however, largely slips past the leading side of the incoming mountain of ice, and the temperature of the air or atmosphere past the mountain and in its wake would drop radically. Even if not, would this heated shockwave be enough to have all of the snow or ice change phase to a liquid, and then change phase again to a vapor? This has to be accomplished in only a few seconds. The blazing object at Tunguska was seen for 10 minutes or more.

I sort of doubt that. The whole idea of an "explosion" of a lightweight ice or snow comet, even if of absolutely gigantic size and traveling at an astounding speed, is enigmatic. The heat of the air at the shock front mostly bypasses the snowball, just as it does with returning spacecraft.

Back to exploding an iceball. Adjustments can be made to the parameters of the imaginary comet -- the size of the incoming object, the speed at which it enters, and the angle at which it enters the atmosphere. The result is that a larger object would represent a larger explosion, a higher incoming speed would increase the shock front temperature but reduce the time to get anything accomplished, but a longer flight path would give more time to melt and vaporize the snow. And then the snow mountain would blow up, causing the blast of the detonation to impinge on the surface of North America.

As Firestone, et alii, write, *"Such airbursts effectively couple the impactor's kinetic energy with the atmosphere or surface, producing devastating blast waves."* That deserves some comment -- to be provided further below.

At this point in the paper the authors have invoked Tunguska, suggesting a precedence for the notion of exploding iceballs by analogy to the Tunguska event, where, after 100 years of investigations and research, there is still no agreement on what the object was or what happened to it.

"The shock wave, thermal pulse, and event-related environmental effects (e.g., extensive biomass burning and food limitations) contributed to end-Pleistocene megafaunal extinctions and adaptive shifts among PaleoAmericans in North America."

I do not doubt the shockwave, the thermal pulse, and the other environmental effects (barring "adaptive shifts"), for all the evidence points to the fact that something like this happened. But that is data. The assignment to an aerial detonation of a giant icy comet as the cause is only sustained by fantasy and is almost completely unlikely, except, of course, that the researchers have no recourse but to use the stock characterizations from the mythology of science.

An expanding compressive shock wave of air, which the authors suggest slammed into the Earth's surface in North America, is something different from the shock front which rides with an incoming bolide. The authors therefore elect to represent the event as an explosion, because an explosion, such as due to the rapid oxidation of volatile chemicals -- like

dynamite or Hydrogen gas -- produces a traveling wave front which expands outward from the location of the explosion. The resulting expansion is the product of the heat of the chemical reaction. This is called a detonation and consists of a rapidly expanding shell of high-pressure and high-temperature gas. The temperature and pressure of the expanding spherical surface also, I should point out, falls off very rapidly with distance.

A massive electric repulsive force has the same effect, and can better explain the burning of the whole continent. A point source, or a source of a limited size, even if miles across, would result in a radial drop-off in effect between "ground zero" and any location further out. That means that whatever the effect would be at one mile from the detonation, the effect would be one fourth at two miles, one ninth at three miles. But the effects will need to be felt well over two thousand miles (3200 km) away from Hudson Bay, even though the effects would be 1/1,000,000th at 1000 miles from ground zero.

A compressive electric field force impinging from above, over an area of perhaps 1000 or 2000 miles (3200 km) diameter, has the same results, but to a degree much greater than what can be imagined as resulting from an exploding icy object a mile or even a few miles in diameter.

Objects at the surface -- mammoths, trees, men -- would be crushed. The very surface of the Earth would be depressed, forcing up the peripheral regions in an instant rebound. The atmosphere would be compressed, and its temperature would rise by thousands of degrees, probably enough to melt rocks and make it flow as a liquid. Evidence of this has been noted by Dennis Cox, an independent researcher, for mountain ridges in the west. The heated compressed air mass at the surface would attempt to escape laterally, burning up everything in its path. This is a blast of heated air which, although diminishing with distance from the original impingement circle of 1000 to 2000 miles diameter, would sustain its extreme temperature for a "wave front" thickness of perhaps up to 500 miles (800 km). That is totally different from the thin high-temperature shell that propels away from an aerial detonation like a soap bubble. The Clovis hunters, together with any standing mammoths, would have been lofted into the air by the wind and completely incinerated in seconds to fall back to Earth as dust. Not as much as a tooth has ever been found of any of these people, only their fires and stone tools. [\[note 3\]](#)

In the text of the paper, Firestone, et alii, detail what they are adding to earlier data:

"Directly beneath the black mat, where present, we found a thin, sedimentary layer (usually less than 5 cm) [2 inches] containing high concentrations of magnetic microspherules and grains, nanodiamonds, iridium at above background levels, and fullerenes containing extra-terrestrial helium [Helium-3]. These indicators are associated with charcoal, soot, carbon spherules, and glass-like carbon, all of which suggest intense wildfires."

The magnetic microspherules and some other materials are associated with a ground impact,

not with atmospheric explosions -- à la Tunguska. They admit as much:

"Most of these markers are associated with previously recorded impacts, but a few are atypical of impact events."

"The evidence points to an extra-terrestrial event with continent-wide effects, especially biomass burning, but the size, density, and composition of the impactor are poorly understood. Even so, current data suggest that this impactor was very different from well studied iron, stony, or chondritic impactors."

I'll say.

I agree with the obvious evaluation of "continent-wide effects." Has fallout been considered? A fallout of atmospheric dust which settled to a depth of 2 inches over all of North America? Admittedly, that is a lot of dust.

"Poorly understood" is shorthand for "we don't know." The authors suggest "most likely a comet," and admit that "the current geologic and geochemical evidence is insufficient to fully understand impact dynamics." It was indeed "very different," something which I will get back to further below, and nothing is known about it -- "insufficient to fully understand."

As I started developing the text of this chapter, contrary studies came forward (which I am not quoting here). However, already a number of catastrophists have bought into the concept, and even Clube and Napier have jumped on the bandwagon. My immediate thinking was that any "impact" that could cause 1500 years of cold and darkness would have to be astoundingly large. It would not likely be an oceanic impact, for that would only have put water vapor into the atmosphere (as happened at the Exodus of 1492 BC).

What most likely happened, as I have already suggested, to cause the start of the Younger Dryas is that nanometer soot entered the stratosphere -- from the largest instantaneous forest fires ever experienced on Earth. That condition answers all the climatic requirements for the Younger Dryas, worldwide. The nearly 2000-year warming period prior to the Younger Dryas had repopulated the plains of North America with trees. There was plenty to burn. (The dry High Plains east of the Rocky Mountains did not come into existence until the catastrophe.)

The Sequence of Events

And so the orthodox paradigm is established. Hesitant tales involving exploding "ET" objects will continue to be told. If the explosion was due to electric field interactions, then the causes are straightforward and the sequence of events is predictable. What becomes then of the greatest interest here is the data which will explain the darkness. But let me first again provide an overview of how an electric field interaction with another planet would develop, with a few details added.

(1) the compressive impact

[Image: schematic of a so-called "microburst," a compressive downward-directed air mass, which is analogous of the 1000- to 2000-mile diameter externally applied repulsive force. After Fernando Caracena.]

A compressive shock is the first element of the electric contact. It is initiated as soon as the planets sense the nearly equal electric charge of each other within a common plasmasphere. The repulsive electric field force is propagated instantly. The repulsive force of the electric field exceeds the gravitational attractive force by more than a billion times a billion times a billion times a billion (10 to the 39th power).

Firestone, et alii, however, use the Tunguska event as a model for the impact of 10,900 BC. The interpretation of their data thus follows the causal lines suggested by the establishment for the enigmatic Tunguska explosion of 1908. I have provided (what I think is) a coherent analysis of Tunguska in the previous chapter. Firestone, et alii, add:

"In 1908, at Tunguska, Siberia, an object less than 150 meters in diameter, either a carbonaceous asteroid or a small, burned-out comet [what on Earth is that?], produced a less than 15-megaton airburst with an intense fireball (10 exp 7 degrees C [10 million degrees Centigrade]) that scorched about 200 square kilometers of trees and leveled about 2,000 square kilometers of forest, yet produced no crater or shock metamorphism."

"A debris shower from a heavily fragmented comet would have produced an airburst barrage that was similar to, although exponentially larger than Tunguska, while causing continent-wide biomass burning and ice-sheet disruption, but again possibly, without typical cratering."

I was surprised at the opening phrase (quoted earlier), "would effectively couple the impactor's kinetic energy with the atmosphere or surface," for this statement would not pass a high-school physics exam. But in addition, Tunguska is not a good model; a better model would be the Himalayas and the Tibetan Plateau. The Himalayas at the edge of the northern border of India form a circular arc some 1,600 miles long (2500 km), which has all the looks of the edge of a compression shock area. The Tibetan Plateau is a depression, behind the arc

of mountains, which has rebounded to a much higher elevation. Almost exactly the same form can be seen in the North American high plains and the adjacent Rocky Mountains. I will present the Tibetan electric field contact, which happened (I suspect) in the year 2349 BC, in chapter 20, "The Flood of Noah," with the details of the mechanics involved discussed in Appendix B, "Celestial Mechanics," complete with diagrams.

The details of the 2349 BC event, and a number of others, were developed long before I took it in mind to look at what all the fuss was concerning the article by Firestone, et alii, about the possible aerial explosion over the Laurentide. The date of the start of the Younger Dryas fit well with a general flight plan which I had already developed for an accidental approach of Earth to Saturn and its planets. The initial admission of Earth to the plasmasphere of Saturn and an electric field contact would have caused a tremendous interaction. The suggestion of an explosion over North America at the start of the Younger Dryas suddenly took on a sensible perspective -- sensible, that is, on my terms, not to the establishment narratives which were developed in total absence of any such notions and are hard and fast linked to fantasies of comet explosions and other articles of faith of mainstream science orthodoxy. As I have noted, this can't be helped for the researchers. They have to conform.

I am here invoking a repulsive force, which would result if the two planets were of near equal charge. Saturn would carry a much higher positive charge because it came from beyond the edge of the Solar System. To experience a repulsive force, Earth would also have been positive to a nearly equal degree, which is one possibility, but unlikely.

If Earth were negatively charged while meeting up with a positively charged planet, the whole affair should have been limited to an attractive force and an arc between the planets in an attempt at charge equalization. Thus, most likely the repulsive force was caused by Mars located below Saturn.

(2) the impact center

From the looks of the curvature of the Rocky Mountains it would seem that Hudson Bay might indeed have been the geometric center of the initial repulsive shock. The area affected probably had a diameter of 2000 miles. I should point out that the shock wave probably traveled to the west coast of the American continent at a rate of 700 miles per hour (1000 km per hr).

The 2000-mile diameter is based on the geometry of other (later) shock impulse areas on Earth, Mercury, and the Moon (which are detailed in later pages, especially Appendix B, "Celestial Mechanics"). We would expect the shock impact area to extend over about 25 to 30 degrees of the circumference of the Earth. The area where the initial shock was felt would thus have been 1700 to 2000 miles in diameter (2700 to 3200 km). The arc of the Rocky Mountains is, in fact, about 1000 to 1200 miles from the center of Hudson Bay -- the "impact" location which has also been suggested by Firestone.

A 2000-mile diameter area would have extended the reach of the shock area in the north to the edge of the Arctic Ocean, in the east to the west coast of Greenland, and in the south to below the Great Lakes. The shock would have traveled in all directions around the Earth to meet at the exact opposite location and would have compressed the Earth surface into a ringed pattern. The antipodal location is in the Indian Ocean, however. Otherwise we would have additional proof of the delivery of the shock from a signature antipodal pile-up -- as we have for similar shock locations on both the Moon and Mercury.

(3) the central area

The first effect of the compressive force would be to push the surface of the Earth down, with the result that the region outside of the 2000-mile diameter area, where the applied force would no longer be vertical, would be pushed up in rebound of the Earth's crust. The central area would thus be expected to be flat and perhaps cracked. It is, in fact, as flat as a pancake, leaving only the earliest geological strata in place on the Canadian Shield. The Canadian Shield is entirely composed of metamorphic rock dating to the Cambrian. Metamorphic rock is defined as altered through great heat and pressure. The eskers and drumlins attest to the edges of the electric field force.

(4) the peripheral mountains

The size of the area affected is determined by the addition of the parallel vectors representing the electric field of the external planet, and the spherical electric field of the Earth. This results in a considerable drop-off away from the center area which is facing the externally imposed electric field. The curvature of the Earth thus causes the applied force to change from being perpendicular to the Earth's surface to assuming an angle much lower to the surface. Rock breaks at a sixty-degree angle to an applied impact. Thus at the periphery of the impact region, the forces would act to shear mountains from their base, in effect plowing them ahead of the applied force.

[Image: Rocky Mountains viewed from the west at Salt Lake city. Public Domain.]

This is what happened to the Himalayas, and what happened to the Rocky Mountains. As the forces declined, an induced change in polarity of the Earth's surface would result in an attempt to lift the Earth's surface where the Rocky Mountains had been. This area is the western High Plains. This is completely analogous to the Tibetan Plateau northeast of the Himalayas,

(5) the center relocated

The center of the applied compressive force would move in its location because the Earth kept rotating. Additionally, because the impulse of the shock was north of the equator, at first the Earth would tilt away from the source of the external force. Thus, in this case, the center of the location which directly faced the Saturnian planet would move south.

The initial shock in 10,900 BC produced twice the torque produced by the much later shock at the Tibetan plateau, at about 35 degrees north latitude. In 10,900 BC the center of the impact area was located much further above the center of Earth, at 60 degrees north latitude. The radius arm of the torque was almost twice as large.

The initial shock would have been immediately followed by a gyroscopic reaction torque also applied about the center of the Earth. The gyroscopic reaction would attempt to re-establish equilibrium for the dislocation of the spin axis. For the case of an external torque applied above the Earth's equator (as here), the gyroscopic reaction will start a rotation of the Earth's spin axis in a counterclockwise direction as seen from above the North Pole. Thus the "west" would move to the "east" faster than the normal rotation of the Earth would do.

Where the center of the impact would move would also depend on the season, that is, in what direction the Earth's axis initially pointed. Of course we have no record of this, unlike the Himalayan impact (which we happen to know to the calendar day), although the season could reasonably be established from the likely relocation of the center of the impact area and the location of the arc.

The center of the impact would move south because the northern hemisphere of the Earth would be shoved away by the exterior force. A gyroscopic reaction torque would respond to this at the same moment, and attempt to rotate the facing Earth surface toward the east in order to cancel the disruption. Thus normally we could expect the impact zone to move south and west.

But it mainly moved south. I would suggest that the center of the impact was not the middle of Hudson Bay, but at James Bay, at the south end of Hudson Bay, somewhat east and north. I am basing this on a map of the distribution of Thorium in North America presented in the book by Firestone, West, and Warwick-Smith, *The Cycle of Cosmic Catastrophes*, published in 2006, and a year before the major paper by Firestone, et alii.

The authors Firestone, West, and Warwick-Smith draw an elliptical area as the "Thorium-free zone" as if to suggest an impact area for a bolide angling in from the northeast, but a look at their map projection graphics would instead suggest a circular area on a globe, which would include all of the province of Quebec and Newfoundland. Using a typical map projection results in a distorted surface depiction. The northwest corner of Hudson Bay is within this

area, as is the US Midwest through Ohio in a semicircle below the Great Lakes.

[*Image: Thorium in North America. (The tip of the arrow is at James Bay.) After Firestone, et al, The Cycle of Cosmic Catastrophes, figure 24.6.*]

This central Thorium-free circular area seems like the best location for my proposed compressive force. The center of this is at James Bay at the southern edge of Hudson Bay. This location, as the center of an impact force, is east of most of the Great Lakes, except for the east-most lakes, Erie and Ontario, which are almost directly below James Bay. This circular area with a center at James Bay would solve the problem of having to suggest that the Earth turned a half hour east from the meridian location of the "impact" by virtue of the fact that the position of the Earth's axis of rotation was leaning toward the trailing part of the orbit -- as happens at the spring equinox. If the Earth's axis tilted back from the impact force, it would first bring Lake Ontario into direct line with the exterior planet.

(6) the high temperature blast

Considering what enormous forces were exhibited just in the plowing of the mountains, it can be understood that animals and humans did not survive in most of North America. The sudden compression of the air would have instantaneously raised the temperature by thousands of degrees -- and incinerated everything in a continental conflagration.

The fires were confined to the west and south. To the north and east lay the remnant of the Laurentide Ice Sheet. This might have been cracked and compressed and might have been pushed aside -- plowed, like the mountains were. It would have also been affected by the

pulse of heat emanating from the center, causing melting of the top surfaces of the glacier.

The researchers have given recognition to the heated atmosphere, suggesting a heat impulse with a temperature of 1000 degrees Centigrade -- 1800 degrees Fahrenheit, enough to melt rocks. This, of course, is based on a point source for a compressive shock wave -- an explosion over the Laurentide Ice Sheet. Except in detail, it would be largely indistinguishable from a 2000-mile diameter area of downward directed force, which much better represent the heating, for it was extensively experienced at surface level -- as the data indicates.

The blast of compressed air which is suggested to extend from a point source above the Laurentide Ice Sheet would reduce the heat of the compressive impulse in relation to the distance from the center. This would differ from the case under consideration here -- an external electric field compressive force of large diameter. The roll-out of pressure from the very large "impact" zone would be horizontal and of much greater sustained magnitude. The soot fell out of the stratosphere, worldwide, over the next thousand years.

(7) cause of the later cooling

It is certain that the soot in the stratosphere not only caused the cooling, but also completed the extinction of much of the North American fauna. There is no need to invoke sudden death due to a wave of extra-terrestrial particles, even if we allow that this, or something like it, happened. The megafauna animals in North America were crushed by the initial compressive force, or instantly obliterated (gasified) by the initial blast of heat of the hurricane winds. The following darkness and the failure of plant growth for a period of 1500 years, or even 1000 years, would remove any of the remaining large animals.

Firestone, et alii, write:

"Increasing evidence suggests that the extinction of many mammalian and avian taxa occurred abruptly and perhaps catastrophically at the onset of the Younger Dryas, and this extinction was pronounced in North America where at least 35 mammal genera disappeared, including mammoths, mastodons, ground sloths, horses, and camels, along with birds and smaller mammals."

"At Murray Springs, Arizona, a well known Clovis site, mammoth bones and Clovis-age stone tools lie directly beneath the black layer where, as described by Haynes, 'The sudden extinction of the Pleistocene megafauna would be dramatically revealed by explaining that all were gone an instant before the black mat was deposited.'"

The extinctions were worldwide. But it was not due to a worldwide influx of neutrons from the far reaches of space or a blast of particles from the Sun. The extinctions, as suggested from the various time delays after the start of the Younger Dryas, were due to the shadow

which fell on the Earth, inhibiting plant growth, and starving the larger animals. Before the Younger Dryas came to an end almost all the huge animals disappeared everywhere except in the tropics, far southern South America, and far Northern Asia. Sixty genera disappeared in Asia; and as many in South America -- twice as many as in North America.

The researchers hold that the "explosion" above North America was the cause for the rapid melting of the Laurentide glacier covering Canada, the extinction of the megafauna, and the 1500-year period of extremely cold climate. Of these three, the climatological mechanics of how the cold came about -- for a period of 1500 years -- remains unexplained by them. What I have suggested is that the same carbon layer which is found on the ground and dated to the start of the Younger Dryas everywhere in North America also occurred in the atmosphere and would have levitated into the stratosphere -- a lasting shadow descended over North America, and within weeks spread throughout the world.

(8) the resulting darkness

The darkness can be held as true without question. North American Indian tribes uniformly recall the darkness at the beginning of time and the beginning of creation, even though their ancestors had experienced the shadow elsewhere than in North America. And neither had they experienced the blast. But everywhere in the world, in the mythology of people, nothing existed earlier. Dwardu Cardona, in *Flare Star* (2007), writes, "*Myths of the age of darkness surface so often among various Amerind tribes that a complete list would bore the reader to death.*" Quoting the Yuma, "*There was no sun, no moon, no stars -- just darkness.*" The darkness came at the beginning of all existence, but this was told by people who invaded the North American continent 600 to 1000 years later, for the original North American tribes, like the megafauna, had been obliterated. Cardona also quotes from Maya, Aztec, and Inca sources. They all say the same thing.

These myths, in fact, exist throughout the world. But archaeologists, astrophysicists, biologists, and geologists are totally unprepared to deal with so-called "myths" as evidence -- despite the ubiquity of this evidence among our forefathers.

(9) energy estimates

Firestone sources O.B. Toon from a 1997 article in *Review of Geophysics*, on the amount of energy involved:

"Toon, et alii, suggest that an impact capable of continent-wide damage requires energy of 10×10^7 megatons equivalent to an impact by a greater than 4-kilometer-wide comet."

An object two and a half miles in diameter (4 kilometers wide), larger than most mountains are high, is thus suggested, with an equivalent "impact" energy of 10×10^7 megatons, which

probably is meant to represent its kinetic energy. This is 10,000,000,000 kilotons of TNT, thus equivalent to 600,000,000 atomic bombs. This value is **an order of magnitude less** than the estimate for the Chicxulub event.

Toon, et alii, also suggest that explosions at an "optimal height" would cause damage "over an area the size of North America, that is, equivalent to a ground impact of 10×10^9 megatons." The value of 10×10^9 megatons in turn is **an order of magnitude greater** than the Chicxulub explosion. Thus we could probably assign an explosive value 10 times larger than the Chicxulub explosion. If these values are reasonable, or even of about the same magnitude, then, knowing the ecological damage done worldwide by the Chicxulub "impact," to which is attributed the extinction of the dinosaurs 65 million years ago, we can reflect on the damage that might have been done at the start of the Younger Dryas.

(10) fine-tuning of nonsense

The authors shun away from an exact "impact" location, because nothing has been found, yet it would have been of an enormous size (2.5 miles, 4 km, in diameter, they say).

There was no impact location. There should be something, perhaps ten times larger in area than the 110-mile (177 km) diameter Chicxulub crater, or at least as large as the 240-mile (400 km) Grand Canyon scar. Firestone suggests the Great Lakes region as the center of the impact, although later in their paper the authors add Hudson Bay. Both apparently are correct.

The Great Lakes region was not under the glacier at the start of the Younger Dryas. Jonathan Adams, in "North America During the last 150,000 Years" (Oak Ridge National Laboratory, 1998), describes the Laurentide glacier already largely in retreat:

"Just before the beginning of the Younger Dryas cold phase, continuing retreat of the ice sheets and recolonization of vegetation allowed conifer forests to return across the Great Lakes region. ... Alaska remained as Tundra, and areas most recently exposed by the retreating ice were also still Tundra."

Because the authors (Firestone, et alii) believe that only an aerial blast could be expected to leave no mark if it happened above the mile-thick Laurentide Ice Sheet, Hudson Bay has been added as an impact location. They write:

"The lack of a crater may be due to prior fragmentation of a large impactor, thereby producing multiple airbursts or craters."

(11) Hudson Bay

The critical reader will recognize this as the fine-tuning of nonsense. Having suggested that perhaps the large bolide broke up while above the surface of the Earth (*à la* Tunguska), there

is then reason to additionally suggest that the smaller parts would not penetrate the ice:

"These results [unpublished impact experiments by P. H. Schultz, one of the authors] suggest that if multiple 2-kilometer objects struck the 2-kilometer-thick Laurentide Ice Sheet at [an angle] less than 30 degrees, they may have left negligible traces after deglaciation."

"Thus, lasting evidence may have been limited to enigmatic depressions or disturbances in the Canadian Shield (e.g., under the Great Lakes or Hudson Bay), while producing marginal or no shock effects and dispersing fine debris composed of the impactor, ice-sheet detritus, and the underlying crust."

Interestingly, it seems that the most obvious cause for cooling during the Younger Dryas is dismissed. About the effect of cooling the Earth's surface due to dust in the stratosphere, the authors write, as I noted before, *"these cooling mechanisms tend to be short-lived."* The sentence continues with:

"... the [clouds] can trigger longer-term consequences through feedback mechanisms. For example, noctilucent clouds can reduce solar insolation at high latitudes, increasing snow accumulation and causing further cooling in a feedback loop."

But snow (moisture) is carried by warm air, not by cooler air. Increased glaciation was not experienced at all, anywhere on Earth, during the Younger Dryas.

This sort of less-than-thorough analysis causes more enigmas and unresolved questions than are explained. The error, as shown by the *Scientific American* article by Alan Bobock and Brian Toon, is to think that dust in the stratosphere would be short-lived. Bobock and Toon had conservatively suggested a period of 10 years from firestorms produced by the equivalent of 1500 kilotons of TNT -- 100 Hiroshima-sized atomic bombs. Coauthor to Firestone, O.B. Toon, had conservatively estimated the damage of the event of the Younger Dryas as representing 10,000,000,000 kilotons of TNT -- equivalent to 600,000,000 atomic bombs, and being "short lived." Who are we kidding here?

Firestone, et alii, instead place their bets with a 1000-year Atlantic cooling, due to the sudden influx of icebergs from the Laurentide Ice Sheet into the North Atlantic. It is doubtful, however, how much of the Laurentide still existed (this was also suggested earlier by Firestone and Topping). With the onset of the severe cold of the Younger Dryas, further melting of the Laurentide would have abruptly ceased. And sliding glaciers need to melt from the bottom in order to skid into oceans. There are no marks of "Heinrich events" recorded in the Atlantic at this time or later. Heinrich events are the dates for debris layers in the Atlantic attributed to glaciers sliding into the ocean. These suggest major dates for large-scale glacial-melting conditions. The last was 500 years before the onset of the Younger Dryas.

In fact, the "collapse of the Gulf Stream," which Firestone invokes under the aegis of North Atlantic glacial influx cooling, is today (and at the time of their paper) more properly dated to about 6200 BC, and lasted a thousand years, thus to 5200 BC. This started 3000 years after the end of the Younger Dryas. This also probably has nothing much to do with a diversion of the Gulf Stream, but more likely represents a large tidal system rotating around Earth in the North Atlantic and North Pacific as Earth started to draw closer to Saturn, but still positioned off center from the south pole of Saturn. It was the nearness of Saturn which caused the new tidal system. This would certainly have disrupted the northern end of the Gulf Stream. A thousand years later (5200 BC) it was over; Earth had repositioned to more or less directly below Saturn, although I have identified this as 5800 BC in later chapters.

The reason for suggesting Hudson Bay as an alternate to the "ground zero" of the Great Lakes is that the Great Lakes region was not covered by ice at the start of the Younger Dryas (even though depicted as such on most "historical" maps). Yet, as Firestone, et alii, have pointed out, the most likely location of a center of impact is the lower Great Lakes, in that "abundances of microspherules and magnetic grains decrease with increasing distance from the Great Lakes region [meaning Lower Michigan]." From the prospect of an electric interaction, the Great Lakes location was not the impact site -- it was instead the location of a series of anode strikes of planet-to-planet electric thunderbolts. This will be a somewhat later element of the complete interaction.

(12) changed polarity

Minutes into the repelling force, the surface of the Earth facing Saturn and Mars would have started to change polarity (becoming less negative) by induction, canceling the repulsive force, and substituting an attractive force. This would have kept Earth from entirely escaping from the Solar system, or to a much larger orbit around the Sun. The attractive electric field forces would also aid the rebound of the depressed area where the repulsive impact was first experienced, and would move the already raised peripheral region even higher. (The sequence of forces responsible for this is detailed in Appendix B.)

In fact, there is a large plateau running parallel to the Rocky Mountains, called the High Plains, and located nearly a mile (1.5 km) higher than the plain to the east. This is similar in shape and location to the Tibetan Plateau, also adjacent to an arc of shoved-over mountains. I would certainly expect a similar raised plateau east of the Rocky Mountains.

Traveling west from Chicago, you will reach a location where a five- or ten-mile incline takes you up to 6000 feet (2000 meters) above sea level. It is called the High Plains in the USA. The High Plains are much longer in the north-south direction than it is wide in the east-west direction. But it is a mile high, and distinct. The plateau extends from the east part of Colorado, at the base of the Rockies, through Eastern Wyoming, Western Kansas and Nebraska, Eastern Montana adjacent to the Rockies, parts of Western South Dakota and North Dakota, and Alberta province in Canada. The plateau includes, as noted by Wikipedia,

buttes and rock outcroppings, as if we are looking at buried mountains, which is how these mountain roots are often represented by geologists. These are the left-behind roots of the Rockies.

(13) the electric arc

As the surface of the Earth facing Mars changed polarity through induction to positive, this potential difference, aided by the ionization of the atmosphere due to the heat pulse, would have initiated an attempt at charge equalization. The location to which the center of the "impact area" had shifted would most likely have been the region of the eastern Great Lakes (as I have described).

But there is nothing seen at the Great Lakes that looks at all like the Grand Canyon. Except, of course, the Great Lakes themselves. And if the Earth was the anode in the electric arc exchange (rather than the cathode, as with the Grand Canyon), we could instead expect a series of giant conical holes as a result. [\[note 4\]](#)

The east-to-west travel of the arc must have been erratic, both at the Great Lakes as at the Grand Canyon. We would expect a general movement of the contact point of the arc to travel south, because the northern hemisphere had been hit, and the northern hemisphere as a result would be tilting away from the location of the contact. Overlaid on this movement would be a travel of the arc to the west, following the turning of the Earth to the east.

Unlike the Grand Canyon, which clearly is a cathode mark, the Great Lakes excavations clearly are anode electric arc marks. And they are gigantic! In a dry landscape an incoming lightning bolt would make a neatly carved circular or conical depression, looking like some sort of impact crater of an object headed for Earth on a trajectory perpendicular to the ground. But there is no evidence of meteorite fragments, no shocked quartz.

In the wet or frozen environment of the central flatlands of the midwest region of the USA, the results were very much like the depressions and concavities produced at the Tunguska site. Except, of course, that the scope is many orders of magnitude greater. Whereas at Tunguska the holes were 6 to 10 feet (2 to 2.5 meters) in diameter (and 12 to 15 feet deep), and some apparently much larger, the blast holes at the Great Lakes look to be 20 to 30 miles (30 to 50 km) in diameter at the bottom. This is an estimate based on what looks like the diameter of the deepest portions of the five lakes, all of which are nearly circular. To go from an area of a 10 feet diameter circle to the area of a 20 mile diameter circle, means that each of the five blasts at the Great Lakes were individually 100 million times more powerful than at Tunguska.

After the furthest east lakes (Ontario or Erie) were struck, the arc would have traveled west, or rather somewhat southwest. South because the northern hemisphere was initially moving away from the direct line of contact, and west because of the rotation of the Earth. After a

strike at Lake Erie, the arc seems to have located north to Lake Huron, and then maintained a nearly westerly direction, across Lower Michigan (where there are hundreds of deep conical lakes) and into Lake Michigan, first at the southern lobe, and then north to the Chippewa Basin, before jumping north to Lake Superior. The lineup of locations follows the same general directional changes as the rip of the Grand Canyon.

The relocation of the Earth's surface under the external force in this sequence of events can be attributed to the gyroscopic reaction torque. If the gyroscopic reaction increased the rotation of the Earth toward the east by 50 percent, the whole of the arcing would have taken a half hour.

The series of electric arc strikes at the Great Lakes suddenly moved inexplicably north from Lake Michigan into Lake Superior. This may represent the moment when the Earth's axis was being uprighted again. The change in forces from repulsive to attractive probably had started to lift the original leaning of the rotational axis away from the external force, so that the "impact center" in effect moved north (the Earth surface at the Great Lakes moved south). Allowing for a time delay due to this second gyroscopic motion, this could represent the relocation of the arc from lower Lake Michigan to Lake Superior.

The arc skipped penetration in Central Lower Michigan, perhaps because of a dome of Mississippian, Silurian, and Ordovician rock filling a lower Cambrian and Precambrian depression in that location. The arc may have played here momentarily, resulting in the later notice by Firestone and Topping of the evidence of an atomic blast. Perhaps the center of the Earth, which might have been the destination for the electric arc, could not be easily reached here. [\[note 5\]](#)

In the book *The Cycle of Cosmic Catastrophes* (2006), the authors Firestone, West, and Warwick-Smith also suggest Lake Michigan as the site of two impacts, one at the center of the lobe-shaped lower (southern) portion and one at the level of Door County in Wisconsin (the Chippewa Basin). This is based not only on the deep depressions in the Lake, but also on collapsed edges surrounding these. Admittedly the discontinuities found by seismic soundings are faultings of the edges of the depression, but, just as these can be suggested to be "the signature of impact craters," they would also result from a hole bored by a gigantic electric arc, especially, perhaps, in that the Lake almost immediately started to fill with water. Firestone, West, and Warwick-Smith qualify their suggestion for an impact crater with:

"Usually, around a true impact, we find rocks that are shocked, fractured, and deformed. But we don't think this was a meteorite impact; we think it was a comet impact or bolide explosion."

That's just total nonsense, and an attempt to have their cake and eat it too.

The Great Lakes

The Great Lakes are a geological enigma. They are some of the deepest lakes in the world, yet how they were formed has remained completely unknown. "Submerged arctic currents" of water have been suggested, or that the lakes might follow a natural crack in the crust of the Earth, dating to billions of years ago.

[Image: Relative sizes of the Great Lakes and surrounding states. After Great Lakes Information Network]

It has also been suggested, that the weight of the superimposed Laurentide Ice Sheet pushed into the ground and gouged out the lakes to a depth of 700 to 1300 feet, although glaciers never did that anywhere else in the world over the course of millions of years.

What is clear today, and acknowledged, is that there were no Great Lakes "before the end of the Ice Age [about 12,000 BC]." What has not been suggested is that the Great Lakes were created at the very beginning of the Younger Dryas (and thus after "the ice age" by 2000 years) by a series of massive electric arcs, in a matter of a half hour.

The Great Lakes are big -- the largest set of fresh water lakes in the world -- with lengths of 350 miles (560 km) for Lake Superior, 300 miles (480 km) for Lake Michigan, 240 miles (386 km) for Lake Erie, 200 miles (322 km) for Lake Huron, and 190 miles (300 km) for Lake Ontario. Compare these lengths with the 220-mile (354-km) length of the Grand Canyon.

And they are very deep. The Grand Canyon is a mile deep (5000 feet, 1600 m), but the Great Lakes include the deepest lakes in the world (except for Lake Tanganyika, 4800 feet deep, with 4000 feet of muck). Lake Superior is 1300 feet (430 m), Lake Michigan is 920 feet (300 m), and the adjacent Lake Huron is 770 feet (250 m) deep. Lake Erie is only 200 feet (65 m)

deep, but Lake Ontario is 800 feet (250 m) deep.

Of course other researchers are denying all evidence of an impact at the Great Lakes, and even suggesting that Firestone, et alii, are claiming an impact, even though the paper by Firestone does nothing of the sort and only suggests an above-surface detonation. Perhaps this is the result of cautious language and cagey phrasing, although the concept of an air blast was clearly announced. See postings at [\[cosmictusk.com\]](http://cosmictusk.com) for additional contentious claims and counterclaims.

Much of the analysis of the "event" is based on the concept of a singular event, or near identical explosive events contiguous in time. But an electric interaction involves a number of discrete phases, which result in at least two "explosions."

The first was represented by the shock of a repulsive impulse. This differs from how the researchers have understood it in being a much larger area -- certainly some 1000 miles in diameter -- rather than a point source. Except for how the shock wave would propagate and how rapidly the effects (like the blast of heated air, the compressive winds) would fall off with distance, the result of the electric interaction and the "exploding 4-kilometer diameter bolide" would match.

Except, of course, on a matter of scale. None of the establishment researchers would ever conceive that the forces involved would be so stupendous that the Rocky Mountains would have been shoved off of the high plains of North America, and piled up in the west. Yet the Rockies have all the same fresh looks that the Himalayas have, which are admitted to be recent in their location ("after the last ice age"), and were shoved over to override another set of earlier mountains. For the Himalayas a 300-million-year "subduction" of the Indian subcontinent was earlier used as a suggested mechanism. There is no continental subduction associated with the Rockies.

The second "explosion" was a thunderbolt of such magnitude that the Great Lakes were carved out of the ground in a matter of perhaps 30 minutes. The establishment arguments against this would be based on an imagined physical impact and issues like the soft or hard underground strata -- as mentioned: Silurian, Devonian rock, Ordovician shale. A lightning bolt just never comes to mind. A lightning bolt that can bore 700 to 1300 feet into the ground will not slow for Silurian rock strata. A lightning bolt answers to the form of the gouged-out lakes, which immediately filled with water from the glacier and with wet soil and muck. The lakes were not scooped out by the glacier. The lakes are all transverse to the direction of the movement of the ice, except for Lake Michigan. [\[note 6\]](#)

The Laurentide Ice Sheet, which still occupied a portion of the Great Lakes region, also would not have brought the arc to a stopping point; instead the arc seemed to have skipped around. The arc moved from east to west, as the Earth rotated to the east. Rather than moving continuously, like the trail at the Grand Canyon, the arc at the Great Lakes seems to have jumped and restarted with each of the lakes. The deep sections of all five lakes are toward the

east end and away from the center of each lake (but north for Lake Michigan). Rather than a continuous moving arc, it looks more like the arc was quenched after each of five or more excavations. The adjacent glacier, melting in the radiation of a multi-billion ampere arc, if not already liquefied by the thermal pulse of the initial shock, perhaps was the cause of that.

After each quenching the arc jumped. The path at the Great lakes is as erratic as the lower course of the Grand Canyon, which shows a constant seeking and testing for a conductive path. As the Grand Canyon shows, this has nothing to do with the hardness or durability of the underlying strata. The Grand Canyon cuts through to Precambrian rock. I would expect a similar result at the Great Lakes, although there looks to be a false start at the central portion of Lower Michigan, as I have noted earlier.

The general direction of the movement of the series of arcs was from east to west. The land surface of the Great Lakes region might have been higher than today, initially pressed up by the weight of the nearby layer of ice, two miles (3 km) thick. There was a lake, called Lake Chicago, created from melt water runoff from the glacier which occupied what today is the flat area which composes most of the city of Chicago. This should have extended all the way to the state of Michigan, but instead we find the deep southern concavity of the present Lake Michigan.

There is the possibility that the holes of the Great Lakes were not made by a single moving arc, but were made by a series of simultaneous or near simultaneous arcs. If I may be allowed to invoke Tunguska (like everyone else does), I could suggest by analogy that the Great Lakes could represent numerous simultaneously created holes and cavities representing only a few thunderclaps.

Particle Tracks

The 2006 book by Firestone, West, and Warwick-Smith reads: "*... on the flakes found further away from the Great Lakes, the tracks were at an angle.*" (pg. 14). They are talking about the tracks of charged particles into chert Clovis spearpoints and the flakes broken from these in sharpening the spearpoints.

The difference in angle convinced the authors that this could not be caused by a supernova, for the admission angle in New Mexico should have been only 10 degrees away from nearly vertical. The latitudinal difference between Lower Michigan and New Mexico is 10 degrees (43 degrees and 33 degrees). If Lower Michigan was the epicenter of a supernova blast, then a 10 degrees difference in the angle at which the particles penetrated chert could be attributed to the curvature of the Earth. But apparently the angle was considerably lower than that (closer to the ground). The authors ignore this moment of truth and end up suggesting a supernova anyway.

The ground surrounding the contact point of the electric arc would have become highly

negative by induction (with the contact point being positive). (Juergens suggested the same differentiation of positive and negative areas for an arc contact on the Moon.) The result would have been the attraction, by the ground surface, of the positively ionized materials being cast up into the atmosphere, or at least a portion of this. Near the arc column these positive materials, after being repelled straight upward but being reversed by their traversal of the surrounding magnetic field, would have ended up expanding away from each other and would likely have traveled up in a spiral.

Closer to the ground and closer to the central plasma column the ions would have been spun out at high speeds, directed down toward the ground. The rest of the surface of the Earth would also be negative (but less so), and provide attraction to materials lofted into the atmosphere at an angle.

In the 2006 book by Firestone, et alii, it is noted that the entry angles for particles which embedded themselves in Clovis spearpoints (chert) in Michigan suggested a straight down trajectory, whereas locations further away from Michigan showed progressively shallower entry angles as well as less penetration. But in both cases the penetration had to be caused by travel of these particles at absolutely enormous speeds (an estimated 10,000 kilometers per second). It certainly was not gravity which sped up the particles. This suggested to the researchers that the cause of these penetrations was a point source in Michigan, which, of course, was thought to be an exploding bolide.

[Image: Positively charged particles enter the magnetic field of a plasma column. Further magnetic field lines not shown. Not to scale; sizes and distances altered for presentation. Illustration by J. Cook.]

We can be more specific. First, what is obvious is that because of the enormous arcs at the Great Lakes region, large amounts of small-sized silicate grains would have been created, all positively charged. These would have been repulsed straight up and away from the ground,

traveling both inside the column of electrons as well as at the edges and beyond. As Juergens has pointed out (from other sources), the upward directed positive ions would have been forced out of the electron column (the plasma column) by the differential voltage between the center of the column and the outer edges of the plasma.

In plasma columns contained in glass tubing, as in a lab, the positive ions end up being dispersed to the walls of the tubing. For the situation of a plasma contact at the Moon, Juergens suggests that the surface of the Moon is the equivalent of the tubing walls, so that positive ions would be dispersed to a wide area.

Similarly for the arcs at the Great Lakes, positive ions would have accelerated upward within the electric column of the downward directed electrons, and at some point escaped, and then changed direction due to the circular magnetic field just outside of the column, to eventually be directed both away and upward at increasing speed.

The change in direction would be affected by the magnetic field surrounding the plasma stream. The billion-ampere arc would be encircled by an intense magnetic field, as all electric conductors are encircled by magnetic fields. Both the electrons headed for Earth and the positively charged particles moving away constitute a current in the same direction (up, as defined in electric theory). This defines a circular magnetic field in a counterclockwise direction as seen from above. The direction does not matter, what matters is what this field would do to any charged particles lofted into the air from the edges of the arc contact point or which escaped from the plasma column.

The ionized particles individually would constitute a current entering a magnetic field. The particles would change direction of travel. The direction of the force experienced by the particles would be at right angles both to the initial direction of travel (the current, since these are positively ionized) and to the direction of the magnetic field vector.

Particles directed upward outside the plasma column, would be diverted away from the plasma column to travel upward in a spiral. Only at the base of the plasma column would ions be sent to travel toward the Earth, and also the same force would move it away from the plasma column. The rotation of ions in the magnetic field does not change the speed of the particles, but it does radically change the direction of travel.

Thus, seen from a direction facing the on-coming "B" vector of the magnetic field, the positively charged particles would be seen to move in a clockwise direction, in large loops. This is the opposite direction from how electrons spiral tightly about magnetic field lines.

Particles exiting the plasma column at an angle (or lofted up at an angle) would experience the same forces, but, because the circular magnetic field drops off with distance from the plasma column, would negotiate a much larger loop.

Considering the volume of bedrock which was converted to silicate dust, the flying particles

must have constituted a virtual rain of materials, all accelerated initially to travel in circular loops. If the arc stopped, the ions would speed away from their circular paths, and, in the region close to the previous arc column, would approach the ground at steep angles, but at much lower angles for destinations further away from the original arc column. [\[note 7\]](#)

In traveling away from the plasma column, the attraction of the Earth's negative electric field (including the induced negative polarity) would take over at some distance away from the plasma column. The particles would speed up, accelerated electrically, and head toward the Earth's surface.

Particles headed for Earth's surface close to the original plasma arc would be accelerated straight down by the region of high negative charge just outside the plasma stream, and attain phenomenal speeds. This would account for particles deeply bored into chert at the Great Lakes region.

The situation outside the arc column is not unlike protons traveling in circles in a cyclotron (also at right angles to a magnetic field), which only gain velocity as an electric field is periodically imposed between the two halves of the cyclotron. This could have been accomplished with fluttering or interruptions of the plasma arc column.

We are dealing here with particles which are smaller than the size of sand grains, but constitute clumps of thousands of molecules, and do not carry single electric charges like protons, but multiple positive charges. Protons will not penetrate chert, or much of anything else, even at energy levels of solar protons ("cosmic rays"). Protons also leave almost no record. The charged grains, on the other hand, already accelerated by the electric field outside the plasma column, could be traveling at enormous speeds once they are released to travel toward Earth.

Another source for the deflection of charged particles might be the single electric field impulse generated whenever the arc stopped. This would be caused by the sudden drop of current in the column of the arc. The collapse of the magnetic field would cause an electric field to be generated, in a standing formation reaching from the Earth's surface to the ionosphere or beyond, plus a transverse magnetic field in the opposite direction as the circular magnetic field associated with the original plasma column. Together these would move out from the center (where the arc had collapsed) at the speed of light, as a single pulse -- a radio wave, a traveling electric field with a magnetic field at right angles.

Neutron Flux

In addition to the positively charged sand-grain sizes of pulverized bedrock, the plasma column would have drawn vast quantities of positively charged protons from the Earth. This bears on the position expressed by Firestone and Topping in their 2001 paper, which reads (as presented in the previous chapter):

"Our research indicates that the entire Great Lakes region (and beyond) was subjected to particle bombardment and a catastrophic nuclear irradiation that produced secondary thermal neutrons from cosmic ray interactions."

"The neutrons produced unusually large quantities of Plutonium-239 and substantially altered the natural uranium abundance ratios (Uranium-235 to Uranium-238) in artifacts and in other exposed materials including cherts, sediments, and the entire landscape. These neutrons necessarily transmuted residual nitrogen (Nitrogen-14) in the dated charcoals to radio-carbon [Carbon-14], thus explaining anomalous dates."

The culprit here is the neutrons, and their genesis in turn is "cosmic ray interactions." "Cosmic rays" are protons. The generation of neutrons could be explained as the process of inverse beta capture by protons -- that is, the equivalent of the addition of an electron to a proton. This can happen to protons in the nucleus of an atom, but does not generally happen to free protons unless additional energy is supplied. (Protons are Hydrogen atoms stripped of an electron.) But there is a simpler solution than a remote supernova.

Firestone and Topping here limit the neutrons as "secondary" and "thermal," that is, neutrons supposedly generated after interactions of protons with other elements and the atmosphere. "Thermal" here means that the neutrons are randomly directed with a range of low speeds.

Let me point out that the incoming stream of electrons, which constitutes a plasma flow in Z-pinch constriction, not only produces radiation in x-rays, ultra violet, and visible light, but also produces neutrons. So, for the situation of an immense electric arc, we have the protons, we have the electrons, we have the neutrons, and we have the surplus energy.

Topping again pointed up the "neutron event" in a reply to comments by John Southon and R.E. Taylor, published in *Mammoth Trumpet Magazine* in issue 17 (2002). William Topping wrote:

"'Depleted' Uranium-235 is caused by neutrons, and the excessive Plutonium-239 found in various Paleo-Indian artifacts also is attributable to 'neutrons in prehistory' considering all available evidence. The genesis of Carbon-14 is neutrons (Nitrogen-14 + n = Carbon-14), and the fact that we have hard evidence for prehistoric neutrons necessarily means Carbon-14 had to have been produced both in situ, and in the atmosphere."

The Carolina Bays

Where the arc at the start of the Younger Dryas struck, it reduced rocks and soil to the consistency of fine sand and clay-sized silicates with no particular distinguishable features, and sprayed it out into the atmosphere like a lawn sprinkler -- and likely with as much water as sand. If there was a spray to the north, it fell on the glacier. We have no record of that

except for the amount of silt left behind after the glacier melted.

[Image: Carolina Bays, Robeson Co, NC. After Virginian-Pilot,]

To the east the spray reached the east coast of the continent and the Atlantic Ocean. North of the states of New Jersey and New York there is no land record; all of the spray might have landed in the Atlantic Ocean. But south of there, and especially in the Carolinas, there is a clear record of oval-shaped depositions of fine sands in sheets 6 feet to 30 feet thick, placed directly on top of older strata, called Carolina Bays. The sand splotches are deposited in three strips near the Atlantic. These are not old strand lines.

Further south from Northern Georgia the spray would have fallen on mountains and more rugged terrain. The "Carolina Bay" forms are only occasionally recognized in Florida, Alabama, and Mississippi. The spray shows up again further west in Texas, Kansas, and Nebraska -- a state full of sand anyway (these last locations are identified in the book by Firestone, West, and Warwick-Smith). There are some 500,000 of these.

The sand includes no fossils or plant material. It is basically sterile. And on the sand layers there are giant depressed oval forms, so that together the marks look as if giant spheres of wet sand were tossed, looking like paint splatters. These forms are universally known as the Carolina Bays, even when not in North or South Carolina. Three proposed models follow.

Eyton and Parkhurst

The earliest model is by J. Ronald Eyton and Judith I. Parkhurst, and published as "A Re-evaluation of the Extraterrestrial Origin of the Carolina Bays" (University of Illinois, 1975), and archived at labob.libs.uga.edu/bobk/cbayint.html. It is amazingly insightful and coherent, even if inconclusive. They write:

"Scattered along the eastern coast of the United States from Southern New Jersey to Northern Florida are approximately 500,000 elliptical depressions collectively called

the Carolina Bays. The process or processes forming symmetrical, oriented, shallow basins of different sizes has been disputed since the unique character of bay morphology was recognized from aerial photographs during the 1930s."

"To date at least sixteen hypotheses involving terrestrial or extraterrestrial processes have been postulated as causal mechanisms. Each theory explains some but not all of the observed morphological and stratigraphic characteristics, and each hypothesis has had varying degrees of acceptance."

Eyton and Parkhurst provide details of the Bays: They are oval-shaped ellipses, but not completely symmetrical. The long axis is oriented to the northwest (in the Carolinas), with extensions of the long axes at one time thought to converge in Ohio, but today understood as coming together in Western Illinois and Wisconsin, or in Lake Michigan if allowances are made for the initial speed of the ejecta due to the rotation of the Earth -- as has been pointed out by others (discussed below).

Not mentioned or emphasized by Eyton and Parkhurst is that some of the axial directional lines of the more southern Carolina Bays do not meet in Illinois and Wisconsin, but point north instead and could even be extended to Hudson Bay with some graphical fudging (which Firestone, West, and Warwick-Smith do). In actuality, these nonconforming lines simply cross all the other Great Lakes. Carolina Bays in southern South Carolina and Georgia point directly north to Lake Erie and Lake Ontario. No one seems to have noticed the obvious.

Eyton and Parkhurst also were unaware of the distinctly shaped Carolina Bays in Nebraska, where the axial line extensions mostly intersect the axial line extensions of the Bays of the Atlantic coast and the Carolinas -- in Central Wisconsin and Northern Illinois.

The Bays consist only of shallow depressions, with a surrounding ridge of sand ("elevated sandy rims"), which is almost always somewhat higher in the southeast -- or opposite the direction from which the splashes seem to have arrived. Many Bays overlap others, without destroying the pattern of the initial Bay, a detail which seems to have utterly confounded most of the researchers (including Firestone). But if understood as aerial depositions of wet sand, it will start to make sense. All the Bays thus look equally well preserved, without regard to the age and condition of the substrate -- "equally preserved on terraces of different ages and formational processes."

As Eyton and Parkhurst summarize:

"... the remarkable regularity with which these characteristics recur suggests that further consideration of a unique, causal mechanism is warranted."

Eyton and Parkhurst then "speculate" (their wording) about a meteor on a low trajectory coming in from the northwest, and shattering over Indiana and Ohio, to send 500,000

fragments toward the Carolinas, each of which, with an additional explosion above ground, formed a Bay with its individual shockwave.

I won't even comment on the unlikeliness of 500,000 "individual shock waves." I think Eyton and Parkhurst go astray with their reliance on the supposition that there is a physical difference between asteroids (known to be rocks), meteors (thought to be rocks), and comets (thought to be snowballs). I would readily entertain their model if I still believed the totally unsubstantiated notion of comets as snowballs, dirty iceballs, or icy dirtballs. The authors also were unaware of other Carolina Bays in Texas and Nebraska (and other locations), where the long axes of the Bays point to the Great Lakes (that is, north and northeast). This largely argues against a meteor on a trajectory from the northwest.

What Eyton and Parkhurst have proposed is a model based on the supposed sequence of events at Tunguska -- a low trajectory, an aerial comet shattering, and compression shockwaves reaching the ground. Plus the later finding at Tunguska of "*spherules believed to be part of the object*" -- on the assumption that there might have been "*an admixture of small grains of non-icy 'dirt' in the dirty iceberg.*" (Eyton and Parkhurst quoting W.K. Hartmann.)

Robert Kobres's meteor

Robert Kobres, a researcher in Athens, Georgia, and a promoter of meteor impacts as the cause for all earthly catastrophes, has kept abreast of the Carolina Bays investigations by providing a collection of documents on the web. Kobres himself proposes something similar to the model of Eyton and Parkhurst, shock-induced dents in existing sand dunes.

[\[abob.libs.uga.edu/bobk/firewate.html\]](http://abob.libs.uga.edu/bobk/firewate.html).

To explain the Bays, Kobres proposes that a comet whipped past the Earth, inexplicably exchanging enormous energy, but not impacting directly to form a typical crater. George Howard (one of the co-authors of the 2007 paper by Firestone, et alii), explains Kobres's model, at [\[www.georgehoward.net/cbays.htm\]](http://www.georgehoward.net/cbays.htm), as, "*It is demonstrable that such an encounter would show [meaning "project"] an intense flash of heat onto the ground below.*"

I wonder how "demonstrable" that concept really is. I think, in fact, that it is not at all demonstrable. It is pure fantasy. It might work for a dropped bomb with a fuse set to explode it 60 feet above the ground, but the overpassing comet needs to clear the Appalachians, and then locate all the sand dunes and beaver ponds. Where did the sand dunes come from if they were clearly not beaches?

This heat, writes Kobres, would have caused moist portions in the Pleistocene landscape (preexisting springs, marshes, and beaver ponds) to explode into steam, leaving the depressions in the ground that we know today as "Carolina Bays." Kobres's only explicit reference to Tunguska is to "oval bogs" first noted at Tunguska in 1927 (by L.A. Kulik), but implicit is the notion of a comet approaching at a low angle, and an aerial explosion or at

least a change to incandescence -- a snowball in flames.

It is, indeed, difficult to imagine anything else than an impact, or, when there is no evidence of an impact, to concoct a damaging non-impact. Meteors or comets will remain in play as long as the massive forces involved in an electric contact with another planet, or the magnitude of the resulting electric arc, remain unimaginable.

Davias and Gilbride

Michael Davias and Jeanette Gilbride, in "Correlating the Orientation of Carolina Bays to a Cosmic Impact" (circa 2005), at [\[cintos.org/\]](http://cintos.org/), retain the comet, but position it on an orbit at right angles to the comets so far proposed by Eyton, Parkhurst, and Kobres. Their bolide comes from the southwest rather than from the northwest, and detonates over Lower Michigan. But they admit:

"A challenging aspect of a Carolina Bay Impact hypothesis involves the lack of an identifiable impact structure."

I'll say. That has been the problem for all researchers involved in the event at the beginning of the Younger Dryas. Davias and Gilbride feel that a geological mark of an "explosion" is to be found in the middle of the state of Michigan. But, never mind, what I want to do is to follow up on the more imaginative thinking of Davias and Gilbride. Having thought to have discovered a likely "impact" (or "launch") location, Davias and Gilbride start to calculate trajectories from a middle location of Lower Michigan to the Carolina Bays in North and South Carolina, which last is the most obvious landing place of the mudballs (which is my nomenclature) or paint spatters (which is their nomenclature) flung from Lower Michigan or somewhere thereabouts.

Let me first confirm what the reader will have already suspected: that I am in full agreement with the concept developed by Davias and Gilbride that the Carolina Bays, where they are preserved in pristine condition by having landed on a nearly flat surface, obviously are exactly what they call them, "paint spatters." This is so clear and obvious that I am immensely surprised that no one else has noted this.

Of course to be able to imagine that large globs of sand and water (at times miles in diameter) flew through the air and landed along the coast of the Carolinas (and many other locations) requires setting aside the prejudices of small scale physics which limit the imagination. But if the creation of the Carolina Bays is associated with the event at the start of the Younger Dryas (although Davias and Gilbride do not think so), then there should be very little question on the magnitude of startling effects. The event preceding the Younger Dryas burned down all of the North American continent in a single moment, as evidenced by the same archaeological "black layer" found everywhere.

The other item undertaken by Davias and Gilbride is a correction of the possible trajectories of these mudballs by taking into account the rotation of the Earth (the Coriolis effect) and air resistance. Having some idea for a location of a launch site, estimates were made by Davias and Gilbride of the flight time and from this the angle and speed at which the mudballs would approach the ground. The authors include some graphics on their website of a landing mudball and its deformation. I should explain, however, that the path of the trajectories is a completely open question, except to assume a 45-degree ascending cannonball trajectory. The path of the mudballs through the air simply cannot be known, even though this information is of great interest in determining the landing speed and approach angle of the mudballs, for these might be checked against the general looks of the impact locations in the Carolinas.

And, in fact, it is hard to believe how these objects, if simply composed of sand (soil) and water, would sustain being dropped on the ground at the speed of a landing jet liner (their estimate) and skidding to a stop at half the distance that the Carolina Bays are long. The difficulties that this has presented to the imagination has kept other researchers busy inventing "impact shocks," "secondary explosions," "strong winds," and landings at "pre-selected sand dunes" and "beaver dams." Davias and Gilbride write:

"We have heuristically and empirically identified the Saginaw Bay area of Michigan as the likely impact [launch] location. At the present time we have yet to identify adequate evidence on the ground to validate the impact identification."

For a heuristic model, the proof is in the pudding. Such is the definition of "heuristic." What we actually have here are a number of suppositions which don't qualify as evidence, yet are used to inform the whole of the model:

"Given the relatively shallow angle of incidence and the hydrated nature of a cometary impactor, the geological signature of the proposed impact structures is unconventional: both shallow and oval. Additionally, the conjecture holds that terrestrial material ejected from such an event would be distributed in a 'butterfly' pattern as a thin sheet whose surface occasionally contains 'Carolina Bay' landforms."

These are not different from the analogical suppositions underlying the previous theories. "Analogy is not proof," wrote Alfred de Grazia, "But to humans of all times, analogy *must be* proof."

The "relatively shallow angle of incidence" of the comet, has nothing to do with the "shallow and oval" impact locations. There is nothing to suggest that a low-flying comet would generate shallow oval Carolina Bays. The "butterfly patterns" and the "occasional landforms" are pure nonsense. The "occasional" Carolina Bays number to 500,000 in the Carolinas alone. I am quoting this to illustrate the desperation among researchers in attempting to find causes.

Continuing with the logic of Davias and Gilbride, they next claim that the advantage of the

"heuristically determined" new location is that loft times for the mudballs are reduced to 6 to 10 minutes, which they consider realistic in that the objects no longer have to be flung into the stratosphere, and would have an exit velocity of about 300 meters per second -- 670 miles per hour (1000 km per hr), 10 times faster than a landing commercial jet. I don't think I can follow any of the math; I'll have to trust them on that.

Mudballs and Frisbees

Regardless of the calculations of Davias and Gilbride, it seems that something has been missed. The Carolina Bays are vastly different in size one from another, and represent masses of sand differing by more than 10,000 to 1. These paint spatters were most likely not launched with a uniform force, because the heavier mudballs would have required more lift or would have fallen far short. The different sized mudballs could only land close to each other if their launching force was independent of their mass. That suggests electrostatic repulsion on individual sand grains as the driving force. For this case the acceleration into the air remains the same since the object sizes remain closely the same: they are grains of sand. It might also suggest that sand and water were launched at the same time and coalesced into spherical forms in transit.

From what is known of the forms -- that they seldom are much longer than wide, that they do not destroy prior Bays, but simply overlay them -- it should be obvious that a low angle for a final trajectory is out of the question. The 700-mile-per-hour (1000-km-per-hr) landing speed would have smeared the mudballs over miles and miles of terrain. So the simile of a landing jet airplane is just not applicable. The Carolina Bays look more like they fell from almost directly overhead, with very little in forward speed and very little in elevation. They look, in fact, as if they hovered before setting down.

The method of achieving a soft landing, which would not disturb earlier Carolina Bays, is to use aerodynamic lift. This suggests, in effect, that the mudballs reshaped in flight into saucers, so that they landed like tossed Frisbees. A sphere has almost no aerodynamic lift, but a rounded (convex) upper surface to a flattened sphere would provide the airfoil and the lift. Understood as Frisbees, the Carolina Bays could very well have flown in at a very low angle before dropping straight down at the last moment. "Settling down" would be a better description of the landings.

[Image: comparing the flight path of a ball and a Frisbee (flying disk). After Wikipedia.]

At this point something needs to be said of the amazing cohesiveness of the mudballs. These would not have survived the landings at 700 miles per hour or a fall from great heights if it were a simple mix of water and sand. I will suggest a consistency akin to bread dough or window putty.

At the location of the electric arc, dust from ground-up silicates would spread out after being lifted by repulsive electric field forces. It would spread out through mutual repulsion. Steam vapor reacts similarly, as we see in the formation of clouds under normal conditions. But more importantly, water has a valence affinity for the positively charged dust, so that the water vapor would distribute its molecules to cling to the sands.

The water which was part of the flung objects must have adhered to the sand like glue. This is explained if we consider that the sand scoured from the contact points of the arcs would have been positively charged when flung (electrostatically repelled) into the atmosphere. It is precisely under this condition that water vapor, because of its two Hydrogen molecules, would grab the sand. Each sand grain would be surrounded by clinging water, and the water would similarly cling to nearby water. It is called "hydration," and described as follows:

"When an ionic or polar compound enters water, it is surrounded by water molecules (Hydration). The relatively small size of water molecules typically allows many water molecules to surround one molecule of solute. The partially negative dipole ends of the water are attracted to positively charged components of the solute, and vice versa for the positive dipole ends."

-- Wikipedia

Sand is hardly a "solute," except for the peculiar condition in this instance of being positively charged and ground to minute particles. This also happens with clays silted from rock. Clays will hold together as a cohesive mass, capable of holding large quantities of water, but so does bread dough, which is even less plastic.

Additionally, the admixture of a very small percentage of bentonite to the sand would increase its mutual adhesion tremendously. This is the difference between sand with which sand castles can be built, and sand which will not hold together. Bentonite is a very fine clay formation, derived from a number of different natural sources, supposedly by wind and wave action. Bentonite will hold many times its own weight in water, and thus promotes colloidal suspensions and sand adhesion. The possibility that the arc created bentonite as well as sand, is likely.

"The ionic surface of bentonite has a useful property in making a sticky coating on sand grains. When a small proportion of finely ground bentonite clay is added to hard sand and wetted, the clay binds the sand particles into a moldable aggregate known as green sand used for making molds in sand casting [a foundry process]."

"... The same effluvial deposition of bentonite clay onto beaches accounts for the variety of plasticity of sand from place to place for building sand castles. Beach sand consisting of only silica and shell grains does not mold well compared to grains coated with bentonite clay. This is why some beaches are much better for building sand castles than others."

-- Wikipedia

Once the mudballs landed, the sand and water mix would start to separate as the negative charge of the Earth's surface neutralized the six-foot layer of positively charged sand and water. The ovoid would slump, the edges would spread and lift from the weight, and a pool of water would filter up to the top as the sand grains were released. The particular sequence here is speculative, of course. It only suggestively accounts for the ridges surrounding the water pools. These can be suggested if the ionic release happened quickly. The raised edge on the southeast side of the Bays in North and South Carolina could, with some fudging, be assigned to the remnant forward momentum of the Frisbee mudballs.

The process of hydration and formation into a single cohesive mass takes time, especially in that the mudballs at times were miles in diameter. It is therefore also possible that in many instances this was not accomplished in transit. This failure to coalesce to flying pancakes might result from changing conditions, or changes in the water and sand mixture. Such might explain the fact that in some regions of the USA the elliptical form of Carolina Bay is not well represented, even though axially aligned puddles exist by the thousands.

I apologize for presenting so much detail for the model of Davias and Gilbride, but it represents an ingenious attempt at a solution. I accept the Carolina Bays as mudball landing marks (the book of Firestone, West, and Warwick-Smith will suggest something very close to that), but not the other suppositions, which lend nothing of coherent or significant detail to the model and, as I probably need not point out, are again based on an analogy of what was thought to have happened at Tunguska -- a comet on a low incoming trajectory, an explosion in the air, or, in this case, a soft landing of sorts in Lower Michigan, and at that location the spewing forth of sand (assumed as the topsoil) mixed with water, and distributed in a "butterfly pattern" as per Tunguska.

An objection to the analysis of Davias and Gilbride is their suggestion of a "butterfly" distribution for the launching of the tossed mudballs. Despite the fact that Davias and Gilbride attempt to relate a "butterfly" distribution to a single particular "impact mark" on Mars, there is simply nothing to back up this notion. Firestone, West, and Warwick-Smith also attempt to relate the Carolina Bays to a few oval craters on Mars and the Moon, but also not convincingly.

Not mentioned by Davias and Gilbride is that the "butterfly" distribution first showed up in the literature of catastrophic impacts in an analysis of downed trees at Tunguska by four Russian investigators (Boyarkina, Demin, Zotkin, Fast, in "Estimation of the blast wave of

the Tunguska meteorite from the forest destruction," *Meteoritika* 1964).

I would be more comfortable in suggesting that the mudballs could have come from any of the Great Lakes, and certainly from Lake Michigan (which was Davies's and Gilbride's original selection) and from Lake Superior (another obvious choice). The only condition requisite to the formation of mudballs would be the inflow of glacial melt waters as the crust of the Earth was being drilled. At the lower portion of Lake Michigan there already existed Lake Chicago.

In addition to the axial lines (of Carolina Bays) pointing to Illinois and Wisconsin, there are a number of extended axial lines, derived initially from Eyton and Parkhurst, which cross (in small groups of two) somewhere in Canada at Hudson Bay, at about 60 degrees latitude. At least, that is the latitude at which all the researchers so far have stopped extending the lines. Eyton and Parkhurst show only three of these lines, and show them for Bays in Southern Georgia and southern South Carolina (Figure 5 of their paper).

Firestone, West, and Warwick-Smith show 11 lines extending north to Hudson Bay. But this, as with Eyton and Parkhurst's earlier map, is graphical fakery. It proves nothing except that some lines drawn from North Carolina or South Carolina will cross in pairs at Hudson Bay. Some do not cross, but might cross much further north, some will never cross. If these locations represent sources for the Bays, it should be noted that they are also twice as far away as the lines terminating in Lake Michigan.

Firestone, West, and Warwick-Smith use this graphic depiction to suggest additional comet explosions over Hudson Bay. Yet what seems to have been universally overlooked is that all the drawn lines clearly cross all the Great Lakes -- Lake Ontario, Lake Erie, Lake Huron, Lake Michigan, and Lake Superior. These lines do not need to be extended into Northern Canada. All the axial lines point to origins in the Great Lakes.

A Lot of Sand

Where did all the excavated and ground up soil and rock layers of the Great Lakes go? Probably it was ejected skyward and fell down throughout North America, to become indistinguishable from other sediment and stray material, and perhaps identified in the future as glacially caused. As Paul Heinrich (posted at <http://cosmictusk.com>, April 13th, 2010) wrote:

"I have personally seen some of the enormous amount of rock material excavated by glaciers from the Great Lakes that now comprise large parts of thick Wisconsinan, Illinoian, and Pre-Illinoian glacial tills that cover large parts of Illinois and other states."

Certainly not "excavated by glaciers," but, all the same, the material is there. So now imagine

a spray of material -- boulders and rocks initially and briefly, and then dirt, fine sand, and water -- jettisoned up at a steep angle at the points of contact of 30 mile-wide electric arcs, and spreading out to be dropped to the ground two and more states away from the Great Lakes. Anything falling on the glacier north of the contact points would disappear to future geological analysis.

The following quotation from Juergens, on the effects of an arc at an anode surface, comments on the immense destruction at the Great Lakes -- the depth of the bored holes, the disappearance of soil and the underlying rock, the dispersal of this as sand and silicate dust over a large area of North America.

"Typical anode effects of a destructive kind, leaving detectable markings after discharges are extinguished, include intense heating by streams of high-energy electrons [1], and erosion due to the leaching away of surface matter in the form of positive ions [2], as well as to the bulk extraction and removal of materials [3]."

The references: [1]: J.D. Cobine, *Gaseous Conductors- Theory and Engineering Applications* (1958); [2]: J.J. and G.P. Thomson *Conduction of Electricity through Gases Vol. 11* (1969); and [3]: E.J. Hellund *The Plasma State* (1961).

The beach sands surrounding the Great Lakes have the same source. This includes the famous Indiana Dunes. The subsoil of Chicago, miles away from the lake, is clean clear sharp sand to a depth of 20 feet (7 meters) or more. The sand is not from millions of years of wave action cleaning out and grinding soil particles to form silt, especially if it is admitted that the Great Lakes did not exist before the end of the Ice Age. This is not beach sand; it is a fine angularly-edged sand, piled up to immense depths. (During recent excavations for new buildings on the north side of Chicago I noted that the sand still carries a static charge.)

The entire process was astoundingly brief. Afterwards the Earth was shrouded by a blanket of fine carbon soot in the stratosphere, which didn't subside for 1500 years. This was the experience of the cold and shadow during the Younger Dryas. When it lifted and light returned, the Earth had drifted to a location somewhere below Saturn.

What Happened Earlier

It could thus be suggested that the earlier periods of cold (and glaciation) were due to the Earth sporadically making electric contact with the plasmasphere of Saturn, and possibly Jupiter, which was located much closer to the Sun initially. This offers a clue to the inevitability of what happened in 10,900 BC.

The evidence, already brought forward in a previous chapter on glaciation, is that prior to this time the Earth's orbit had been continuously modified over extended periods of time, and frequently abruptly. After every modification, and especially after being bounced or dragged

to a larger orbit, the orbit of Earth would probably circularize again rapidly on escaping (in a few years or decades).

[Image: Residual Carbon-14 as a fraction of total observed Carbon-14; after Firestone and Topping.]

Of some interest in this respect is a graph of Carbon-14 changes since 50,000 ya, presented in the book by Firestone, West, and Warwick-Smith (also presented with the paper by Richard Firestone and William Topping in 2001). The graph shows repeated data peaks which are mostly ignored by Firestone, West, and Warwick-Smith, except as it might seem to validate their theory of a supernova as the cause for the Younger Dryas incident.

The original data is from A.H.L. Voelker, et alii, in 1998. This is shown above, although marked up by Firestone and Topping in their 2001 *Mammoth Trumpet Magazine* article. What is being presented here is the past Carbon-14 level as a fraction of the current value.

As mentioned above, Carbon-14 excursions (peaks) are shown in the papers by Firestone, the last for 13,000 bp (10,900 BC). Nothing much is made of the date 3000 years before the 13,000 bp "event," and probably little could be made of it, except the suggestion by some that Australia experienced an extinction event. Of course the researchers want to tie the dates of some of the peaks to the arrival times of waves of particles and other things from a distant supernova, but a lot of peaks in the data are neglected.

The researchers write:

"Such sharp increases in Carbon-14 on Earth can be caused only by a sudden increase in the cosmic-ray rate or by direct deposition of radio-carbon [Carbon-14] from an

impacting body."

Direct deposition?

Neglecting the use of this data in the service of proving a supernova, I think the graph can alternately be used to suggest a number of interactions of Earth with Saturn over the course of the last 50,000 years. The graph shows a relatively quiet period of about 6000 years after a large excursion of the level of change of Carbon-14 at about 47,000 bp before the first large increase in 41,000 bp. Perhaps a slow slippage (lowering) of Earth's orbit forced Earth into repeated contacts with Saturn at 2000 to 5000 year intervals -- starting at about 41,000 years ago. Since 41,000 ya, I count 8 peaks from the graph presented as Figure 22.2 in the book by Firestone, West, and Warwick-Smith (or the 2001 paper). [\[note 8\]](#)

In suggesting a supernova as the source of the "event" at the beginning of the Younger Dryas, the authors have particularly noted the two earlier large increases in the Carbon-14 level and hold that all three events are related to a single supernova. The dates of the three events are identified by them as:

- 41,000 ya -- supposedly the arrival of initial Gamma rays, but here also called "cosmic rays," and associated surface radioactivity. The megafauna of Australia disappeared at this time (others suggest that the peak of 47,000 bp was responsible, other data points to 13,000 bp);
- 34,000 ya -- supposedly the arrival of a "shock wave," consisting of "debris" and particles, probably meaning protons, and (uncertain) radioactivity;
- 16,000 to 13,000 ya -- the event before the Younger Dryas, supposedly consisting of a barrage of shrapnel consisting of fullerenes, carbon spheres, magnetic spheres, nanodiamonds, and other things, plus associated radioactivity.

Not included in the above listings is the fact that in all three instances the magnetic field relocated toward the equator or further south or "wandered about":

"At those times [41,000 ya and 34,000 ya], Earth's magnetic field wavered and almost reversed, meaning the north magnetic pole nearly flipped down to become the south [magnetic] pole."

For the last instance (13,000 ya) they write:

"... Earth's magnetic field flickered briefly, causing the magnetic poles to wander crazily across the planet. The north magnetic pole briefly approached the equator before it recovered."

- 1 - Laschamp magnetic anomaly of ca 41,000 bp; Australian megafauna extinction
- 2 - Mono Lake magnetic anomaly of ca 34,000 bp
- 3 - Magnetic anomaly of 13,000 bp; North American megafauna extinction

It is suggested that the impinging external radiation and particles induced the change in the magnetic field. (How would this happen?) So, although the three waves of the supernova -- radiation, shockwave, debris -- were suggested as being radically different in their makeup, they each produced nearly identical results. [\[note 9\]](#)

Setting aside the imagined supernova with its three shock fronts, it could be suggested that the events of 41,000 ya, 34,000 ya, and 13,000 ya are simply excursions of the Earth into the plasmasphere of Saturn. In each case the much more extensive (larger and stable) external magnetic field of Saturn was experienced with the result that the Earth's magnetic field attempted to align with this, perhaps somewhat reluctantly because of the remnant magnetism of the crust. Thus with Earth beside Saturn, and at an equatorial level with it, the Earth's magnetic field would attempt to flip, so that its north magnetic pole would be aligned with Saturn's south magnetic pole.

In terms of absolute values of magnetism, the magnetic field of Saturn and the Earth are fairly weak, compared, for example to Jupiter. I would not have conceived of an alignment of magnetic fields as an index of where Earth would have been located with respect to Saturn, if it were not for the fact that (as will be pointed out in the next chapter) the later alignment of Uranus to Saturn's rotational or magnetic axis involved only Uranus's south magnetic pole placed directly above the north magnetic pole of Saturn (with Neptune in between).

The last entry in 13,000 ya was considerably different from the previous two (41,000 ya and 34,000 ya) where the magnetic field simply tried to turn upside down. In the last instance the field "wandered" and "approached the equator." This could be expected if the Earth was

below the equatorial level of Saturn, but still well away from its rotational axis. The Earth's magnetic field would attempt to displace itself to lying horizontally, that is, across the equator. As the Earth turned, the north magnetic pole would "wander."

It would seem that the repeated contacts between Earth and Saturn moved lower over the course of some 30,000 years -- at least, in these three instances, and as graphically represented here (and assuming there is some truth in all this). An interesting indication of this is that the presumed electric contact of 41,000 ya in Australia was below the Earth's equator, suggesting that Earth passed Saturn above Saturn's equator. There is no clear record of a land contact in 34,000 ya. But the contact of 13,000 ya, as we know, was some 60 degrees north of the Earth's equator. The passes between Earth and Saturn had progressed, very slowly, from having Earth above the equatorial level of Saturn, to well below.

The oldest records brought forward in the Maya *Chilam Balam* record seven sightings of the "stones" representing God the Father who was attempting to come into existence. Enormous spans of time are indicated between approaches of the stones, although more likely "approaches" should be understood as the time of the leave-takings of Saturn.

In the chapter "The Olmec Record of the Past," written long before the current chapter, I had suggested that the *Chilam Balam* record might go back 30,000 or 40,000 years. I would now suggest that this record starts in 41,000 BC. At that time Australia and Southeast Asia were assaulted (apparently) by an electric field contact with Saturn. The megafauna of Australia and Southeast Asia went extinct, as did the Cro-Magnon living in the west of Australia.

If this information could be correlated to glaciation and Ice Age temperatures over the last 50,000 years, it might suggest that Earth was captured and released by Saturn seven times before the last event (the Younger Dryas). The temporary capture meets the conditions suggested by Tom Van Flandern, and also follow his suggestion that such capture could be temporary -- although measured in thousands of years. In each case capture would be initiated with Earth and Saturn near the Sun. Releases would happen under the same conditions.

The last interaction with Saturn in 13,000 bp (10,900 BC) most likely represents the time when "things were put in shadow," as stated by the Quiche Maya creation epic, the *Popol Vuh*. The *Popol Vuh* promises to give an "account of how things were put in shadow" but never explicitly gets to that.

This last contact with Saturn would have happened with the Earth well below Saturn and nearly axially aligned (the axes in parallel), and the Earth's magnetic field, as implied from secondary data by Anthony Peratt, primarily in an up-down direction (see a later chapter for this).

The two dates of 41,000 ya and 34,000 ya can be checked against Ice Core Temperature chart and the Italian Bog Temperature chart in the endnotes of a previous chapter. It will also be

seen that there are eight sudden peaks in the Greenland ice core temperature after 41,000 ya (shown below), and (on another chart) five Heinrich events (marked H6 to H2) which have occurred since 40,000 ya (H1 at about 13,000 ya was originally not shown), indicating as many Canadian Glaciers skidding into the Atlantic.

[Image: Greenland ice core temperatures (degrees Centigrade) since 40,000 ya. After Gamble.]

What does this mean? If, in concert with Firestone, we can only assign three of the temperature excursions to plasma contacts with Saturn, what was behind the total of eight global climate changes, lasting 2000 years at times? Except as speculated above, I do not know. And, except for even stranger speculation, no one else seems to know.

That Earth was not entirely expelled from the Solar System with the infrequent contacts is a mystery unless we keep in mind that Saturn, being on an elliptical orbit, might have provided a constantly available source of orbital correction for Earth. Thus the cold periods of the ice ages probably do not have a single cause. They are the result of a number of rapid changes superimposed on long-term slowly repeating cycles. [\[note 10\]](#)

Endnotes

Note 1 --

The real test would be to find sources for the formation of the various carbon forms and radioactive products, which constitute the data for Firestone and the other researchers, other than extraterrestrial. I had started to do this, but did not complete the listing. Firestone admits other sources for many of the molecular products (high temperature, high pressure, electric arcing), and even lists some which would contraindicate extraterrestrial sources.

Then, in 2010 and 2011, claims to a comet impact started being disputed with a series of articles which generally took exception to the supposed comet debris (buckyballs, nanodiamonds). To be implied from this missing or incorrectly described secondary data is that perhaps there was no comet. Nevertheless, all the signs of a massive impact remain.

Since then Allen West has lost his reputation. In an article titled "Comet claim comes crashing to earth," in *Pacific Standard Magazine* (May 14, 2011), Rex Dalton wrote:

"West is Allen Whitt -- who, in 2002, was fined by California and convicted for masquerading as a state-licensed geologist when he charged small-town officials fat fees for water studies. After completing probation in 2003 in San Bernardino County, he began work on the comet theory, legally adopting his new name in 2006 as he promoted it in a popular book. Only when questioned by this reporter last year did his co-authors learn his original identity and legal history. Since then, they have not disclosed it to the scientific community."

-- [\[www.psmag.com/science/comet-claim-comes-crashing-to-earth-31180/\]](http://www.psmag.com/science/comet-claim-comes-crashing-to-earth-31180/)

That doesn't mean that West doesn't know what he is doing. The problem with this study is not West's hazy qualifications, but the fact that there never was a comet or a comet impact. The critics are pointing that out, and if they have their way, the whole of the climate change at the Younger Dryas, the extinction of the mammoths, the demise of the Clovis hunters, and all the wrong Carbon-14 dates will be thrown out also. Some of the claims quoted at psmag.com as representing the counter arguments, like "the American Buffalo survived," are just astoundingly ignorant for "scientists."

[\[return to text\]](#)

Note 2 --

These oval forms also appear near Lake Tanganyika in Africa.

[\[return to text\]](#)

Note 3 --

On molten mountaintops and ridges, see Dennis Cox, who has investigated altered landforms, presented at [\[sites.google.com/site/dragonstormproject/\]](https://sites.google.com/site/dragonstormproject/), and attributed by him to the event at the start of the Younger Dryas. Cox inadvertently adds in the later burn marks due to Mars in the 8th and 7th century BC in northern Mexico and southern USA.

See also Michael Steinbacher, "Notes Toward an Electric Catastrophist Model for Geology" (EU 2014 Conference, March 22, 2014, and [\[www.eu-geology.com/\]](http://www.eu-geology.com/)).

[\[return to text\]](#)

Note 4 --

I wrote up the effect of an arc (or as it turned out, a series of arcs) at the surmised location of the Great Lakes before checking bathymetric data for the Great Lakes. Seems that my initial guess was correct. I knew that they were deep, but they turned out to be extremely deep, and primarily consist of circular depressions -- looking like bored holes.

[\[return to text\]](#)

Note 5 --

It has to be suggested that the electric field contact happened during daylight, so that Earth would have been on an outer orbit with respect to Saturn. "Daylight" would account for the interrupted slaughter and removal (sawing off) of a single mammoth tusk which was abandoned at the edge of the ancient waterhole and swamp at the Blackwater Draw archaeological site in New Mexico. The suggestion for this coincidence is related in *The Cycle of Cosmic Catastrophes*.

[\[return to text\]](#)

Note 6 --

Bathymetry data for the Great Lakes follows, not shown in correct scale (sizes and depths are listed). All images after [\[glerl.noaa.gov\]](http://glerl.noaa.gov).

[Image: Lake Ontario; 193 miles long; Maximum depth 808 feet.]

[Image: Lake Erie; 240 miles long; Maximum depth 210 feet.]

[Image: Lake Huron; 206 miles long; Maximum depth 770 feet.]

[Image: Lake Michigan; 307 miles long; Maximum depth 923 feet.]

[Image: Lake Superior; 350 miles long; Maximum depth 1332 feet.]

The total time for the series of arcs should have been about an hour under normal conditions, since the locations span about a time zone. But the gyroscopic reaction of the Earth would have brought up the west to move faster than usual toward the east at this latitude (45 degrees north).

[\[return to text\]](#)

Note 7 --

I have since become aware of nearly the same analysis, but for tornadoes, by Peter Thomson, found at [\[www.peter-thomson.com/tornado/\]](http://www.peter-thomson.com/tornado/) and more vividly illustrated.

[\[return to text\]](#)

Note 8 --

The original data is from a paper by Antje (A.H.L.) Voelker, et alii, "Correlation of marine ¹⁴C ages from the Nordic Seas with the GISP2 isotope record: Implications for radio-carbon calibration beyond 25 ka bp" [kiloyears-ago before-the-present] (1998), *Radiocarbon* v 40.

The unexplained dip at 16,000 bp might reasonably be equated with the cold snap of the Older Dryas, thought to be only 100 to 150 years in duration, or more likely with the Oldest Dryas, an ill-defined cold period from approximately 18,000 bp to 15,000 bp.

[\[return to text\]](#)

Note 9 --

There is no thought of applying electric field theory, or suggestions that the magnetic field would have changed with a change in the magnitude or direction of an external electric field, or for that matter, an adjacent magnetic field. Electric considerations are completely absent from astrophysics. Yet what we have here (in Firestone's book) is the implicit admission that the Earth's magnetic field is influenced by something external. This is generally also not allowed in geoscience.

[\[return to text\]](#)

Note 10 --

I have seen claims by oceanographers that a Fourier analysis of the oceanic core data accurately reflects the Milankovitch climatic cycles -- the climatic response of the Earth to the inclination of the axis, the precession of the polar axis, the precession of the orbit, and other factors -- all based on current conditions. Fourier analysis is a method of resolving an arbitrary waveform (or time series) into an approximate set of sinusoidal frequencies.

"When Fourier analysis was applied to deep-sea records in 1975, it emerged that the oxygen-isotope series contained strong cycles with periods near 100,000 years, 41,000 years, and 23,000 years. These are precisely the periods expected if Earth's orbital elements (eccentricity, obliquity, and precession) govern ice-age climates, as proposed by Milankovitch Theory. Thus, there could be no more doubt that orbital elements had to be considered as important drivers of climate on long time scales."

-- [\[earthguide.ucsd.edu/virtualmuseum/climatechange2/03_1.shtml\]](http://earthguide.ucsd.edu/virtualmuseum/climatechange2/03_1.shtml)

Other researchers are far less convinced. It is as easy to say that evidence for the Milankovitch climatic cycles *exists*, as it is to suggest that it only *might* exist. The highs and lows in climatic conditions would have to appear at times equal to the sums and differences of the three cycles listed above. They do not. That is not to say that there are not some very large time cycles involved, but these would, as I pointed out in the text, change over time.

In fact, one does not need Fourier analysis to pick the intervals mentioned above (100,000, 41,000, and 23,000 years) from the data. The periodicity can be visually identified, but the intervals only approximate the current estimates of eccentricity, obliquity, and precession. The Fourier analysis also does not explain the series of cold and warm periods of the last 100,000 years and does not explain why all such variation completely disappeared from the data 10,000 years ago. Also left unexplained is the steep slope of the transitions from a cold period to a warm period and the reverse.

Recovering the Lost World, A Saturnian Cosmology -- Jno Cook

Chapter 10: The Peratt Column.

\$Revision: 42.62 \$ (peratt.php)

Contents of this chapter: [\[The Peratt Column\]](#) [\[The Opossum\]](#) [\[Nazca lines\]](#) [\[The Popol Vuh\]](#) [\[Survey of the World\]](#) [\[Ley Lines\]](#) [\[God speaks to Job\]](#) [\[The Stones at Carnac\]](#) [\[Vishnu Takes Three Steps\]](#) [\[The Heart of Sky\]](#) [\[Lepenski Vir\]](#) [\[Sheela Na Gig\]](#) [\[Fish-man Oannes\]](#) [\[Mari the Spinner\]](#) [\[Neith of the Arrows\]](#) [\[Magic Mountain Islands\]](#) [\[The Kojiki\]](#) [\[Cerberus of Hades\]](#) [\[The Phoenix\]](#) [\[Pacific Islands\]](#) [\[The Prose Edda\]](#) [\[Plasmoid dates\]](#) [\[Endnotes\]](#)

The Peratt Column

I will now answer the question of why people throughout the world would scale high cliffs to record the apparition in the south sky. People needed to find out where the sweepers and animals, which were seen traveling south along the lines of electrons, were going. The discontinuities in the electron streams looked like men with brooms or looked like animals. In fact, I will propose that most people on Earth came to the conclusion that life after death included a process of travel along these lines to the three mounds below the South Pole. It was a religious philosophy which held for 7000 years -- until Saturn in the north lighted up and a new destination was established.

In papers published in *The IEEE Transactions on Plasma Science*, in 2003 and 2007, Anthony Peratt demonstrated that about 40 percent of the millions of petroglyphs carved worldwide are representations of plasma column instabilities.

This column of plasma (consisting of individual streams of electrons in arc mode) stretched away from the South Pole, and at some distance from the pole took a turn away from the Earth's axis of rotation (apparently some 30 degrees). Three ball-shaped plasmoids in this stream were located at distances of 165,000, 190,000, and 435,000 miles (265,000, 300,000, and 700,000 km) below the South Pole. The bend in the column allowed the destinations to be glimpsed even at far northern latitudes on a daily basis. Peratt has named the visible stream of plasma the "Peratt Column." [\[note 1\]](#)

Peratt writes, "The number of millennia or centuries involved remains unknown," and offers a broad estimate of 10,000 BC to 2,000 BC. In only one instance, for petroglyphs in the

southwest of the USA, does he use a more specific date, "these objects stretched back some 7000 years in time." Thus we have one estimate here of about 5000 BC. He also notes that some petroglyphs were overdrawn or added to "two or three times." This would suggest periods of centuries.

The Peratt column developed as Earth moved from a lateral location with respect to Saturn to closer to its axis of rotation. Earth would have traveled into the lower coma of Saturn. I suspect that the edge of the coma was reached in 10,900 BC. That is the date of the impact in North America, offered by Richard Firestone *et alii* as detailed in a previous chapter.

The display of the ball plasmoids lasted for 2500 years. Only at the close of this, or later, did humanity start the construction of huge mounds and lines of standing stones in an effort to coax the return of the plasmoids. There are mounds at Carnac which date from 5800 BC. There are very large mounds elsewhere in Western Europe which date earlier than this. But it is from Mesoamerica that we receive a recorded estimate. It is the Maya stelae which suggest an ending date for the "First Creation" in 8347 BC:

*"(And then) there was an event /
(on) 4-Ahau / 8-Cumku /
were completed / 13 Baktuns"*

*"13 Baktun, 0 Katun, 0 Tun, 0 Uinal, 0 Kin,
4-Ahau 8-Cumku, was (first) seen
the image of the turtle."*

To the Maya "13 Baktun" is equivalent to "zero Baktun," where "4-Ahau 8-Cumku" are the names of the day in the Tzolkin calendar. A Baktun is a period of 400 years of 360 days, by the accounting of the Olmecs since 747 BC, but in remote antiquity the Baktuns probably just represented 400 solar years. On completing the 13th Baktun, the cycle of year counts was started over. The date of "13 Baktun, 0 Katun, 0 Tun, 0 Uinal, 0 Kin" (13.0.0.0.0 for short) has been determined by archaeologists to represent August 13, 3114 BC on the Gregorian calendar.

But it is not. This is not when the turtle showed.

To the Maya, time was cyclical, and the 5200-year (13 Baktun) cycle of years which started in 3114 BC (actually 3147 BC in solar years), is wholly equivalent to the previous cycle of 5200 years. Thus the previous cycle of 5200 years started in 8347 BC. Because the stelae had insistently mentioned either the first showing of "the turtle" ("great god lord") or the placement of "the three stones," there is good reason to suggest a closing date of 8347 BC -- 5200 years before 3147 BC.

The reason the Baktuns recycle when the 13th Baktun is reached is because the Olmecs or their predecessors first started to count years (I suspect) long before 10,900 BC, and thus

long before the ball plasmoids first showed -- as the turtle, or the three heart-stones. When the three appearances of the ball plasmoids ended, 2553 years had past, and the year count was at 13 Baktuns, in 8347 BC.

There are two inscriptions among the Maya standing stones which refer to this previous period, ending in 8347 BC; one list the Tzolkin and Haab day names of 4-Ahau 8-Zotz. (See S Morley, *An introduction to the Study of Maya Hieroglyphs* (1915))

When by coincidence the polar configuration came apart in 3147 BC, a 13th Baktun had again been reached, and a new count of years was established on the conviction that, although all other measures of time recycle on reaching a value of twenty, the Baktuns were destined to repeat when 13 was reached. (In the later Haab calendar the months recycle at 18.)

[Image: The image of the turtle, from a stela inscription; after Mayer.]

It is obvious from Peratt's descriptions that both "the turtle" and the "three stones" represent the southern plasmoid which showed long before 3147 BC. In fact, he suggests dates as early as 10,000 BC. But from the Maya, and their predecessors, we learn that the first showing of the "turtle" ended in 8347 BC -- an event which the Maya called the close of the "First Creation." From Firestone's investigation it is obvious that the ball plasmoids would have first lit up the sky in the south in 10,900 BC. [\[note 2\]](#)

Because of instabilities in the flow of plasma, the columns leading to the plasmoids at various times assumed different shapes -- most notably, the outline of a "squatting man." (It is uncertain if this involved single electron columns, or all of them grouped as one.)

[Image: Left: Peratt Column below the South Pole, a reconstruction. Right: A petroglyph rendering in Australia, dated to circa 5000 BC (but likely to be before 8347 BC). Not shown clearly in this reproduction of the ball plasmoids is what looks like a face in the center of the nearest (lower) ball plasmoid. Such details could not be seen in the northern hemisphere because of the intervening equatorial rings. After Peratt.]

This self-illuminated visual experience, never seen before on Earth, was recorded in millions of petroglyphs and pictographs (Peratt collected data on 4,000,000 petroglyphs). Many other forms taken by the lines of electrons were carved or painted in large scale on rock cliffs high above ground, and always with a view of the south or south polar regions, and often in a manner which blocked the direct view of the plasmoid, which would have been of startling brilliance -- like looking at arc welding.

An analysis of the locations, points of view, and visual elevations of millions of petroglyphs has allowed reconstruction of the shape of the entities seen beyond the South Pole. Peratt concludes that the columns of electrons were shaped (in its stable form) in the form of a tube surrounding the Earth, but not concentric with the south magnetic pole, which surprised Peratt, but concentric with the south geographic pole. Nothing of interest was seen at the Earth's North Pole at this time -- at least, so it was assumed by the researchers. There were additional shapes above the North Pole, shrouded in plasma, as we will see, which would later completely eclipse the images seen in the south.

The finding by Peratt, that this display was exclusively seen above the south polar region, has confounded Saturnian catastrophists, for it was never expected. All expectations were of a plasma display to only be seen in the north skies. From the perspective of my narrative, the display in the south came as no large surprise. It fits in well with the chronology I had already established from the forms of figurines over time in remote antiquity. The presence of Earth within the coma (plasmasphere) of Saturn, and located below Saturn, would explain the travel of massive amounts of electrons past the Earth in a northerly direction toward Saturn.

Peratt, in fact, suggests that Earth was surrounded by a tube of electron beams which converged upon itself (pinching) below the South Pole of Earth, and everywhere was in arc mode in separate bundles. Nothing is said (in the papers) of what happened to the bundles of electrons above the North Pole, although their passage past Earth is illustrated.

Some of the problems Peratt has with the form of this "aurora" -- it's centering on the geographic pole, the lack of evidence for a similar northern destination -- clearly derives from an attempt to integrate this display with the concept that, if this were an actual aurora, then the inflow of particles from the Sun should have reached Earth laterally and divided up to cause auroras at both poles. But the Sun was out of the picture at this time, electrically invisible to Earth. The gradient of the electric field exterior to the Earth pointed in the up-down direction. It was the electric field of Saturn. The source of the flux of electron-dominated plasma was clearly from the south, headed for Saturn (properly, the flow of electricity is in the opposite direction). It was not destined for Earth but it was using Earth as part of a circuit, with the plasma headed for the boundaries of Saturn's coma. This was not an aurora. [\[note 3\]](#)

Peratt has earlier stated that there was no apparent coincidence with the south magnetic pole, and also noted that the beams of electrons passed by the Earth. Peratt published before Firestone (the 10,900 BC event), so he would not know of the incineration of North America, which poured massive amounts of micro-sized carbon particles and carbon gas into the stratosphere.

This entirely explains why the beams of electrons bypassed Earth. It would have been the upper atmospheric layer of carbon which prevented the plasmastream from Saturn from reaching Earth. Plasma depends only on one or two percent ionized anions or cations in a rarefied gas atmosphere. This will be a very low resistance. It was, in fact, thought, a century ago, that plasma streams had no internal resistance. But it was established in this century that there was a resistance.

Imagine a plasma stream meeting the stratosphere where conduction was limited by the high resistance of carbon micro particles, or a carbon gas. The current would drop to zero. And not just the stratosphere, 6 to 8 miles up at the equator, but with the possibility of single particles drifting into the thermosphere, which starts at 53 miles up, and extends hundreds of miles.

The plasma stream from Saturn would normally have headed for the north magnetic pole. But it could not be reached. This was what confounded Peratt, who completely expected the streams to impinge on the magnetic poles, south or north.

Earth was avoided because even a few inches into a region with carbon atoms, even if widely dispersed, would dissipate the flow of plasma. Earth was in effect insulated and isolated, although its electric field guided the electron beams.

The beams extended 165,000 to 435,000 more miles before developing the three plasmoids as a means of gathering electrons, possibly from outside the plasmasphere of Saturn, or else at the lower edge.

The reason the beams took a turn at some location below Earth would have been entirely due to the fact that Earth was not as yet directly below the south pole of Saturn. Away from Earth the electron beams followed the electric field of Saturn.

At some point it ended altogether, after all the layer of soot in the stratosphere had slowly depleted. At this time enough light from the Sun passed through to warm up the Earth after 1500 years. But enough probably remained to keep the electron streams out for another 1000 years. It would be expected that the depletion tapered off exponentially. And thus a considerable amount would remain, and although perhaps only a minute percentage. The remaining carbon probably amounted to only a smallest fraction of a percent by 8347 BC.

Electrons would travel north, while positive ions would travel south. This bi-directional streaming of particles, by convention, defines an electric current as headed south. [\[note 4\]](#)

The visibility of the column is caused by electrons in the flow spiraling about local magnetic field lines at speeds approaching the speed of light, called synchrotron motion. This constant change in the direction of travel causes the electrons to emit radiation in radio frequencies, x-rays, ultra violet, and visible light.

In that the flow of ions and electrons was 10 to 100 times as powerful as is today experienced with auroras, it is to be expected that the Earth's magnetic field would be aligned with its rotational axis. This would certainly be the case if, as I have suggested, the Earth's magnetic field is externally induced.

The column stretching away from the South Pole included a bend at some distance away from Earth, which allowed it to be seen also in the northern hemisphere of Earth, in fact, from as high as 70 degrees north latitude. My first guess was that the bend would be based on the angular difference between where in the dome of the stars the rotational axis of Saturn pointed and where the rotational axis of Earth pointed.

Peratt suggested a bend in the stream of 10 to 15 degrees, based on his analysis of worldwide data. This does not make sense for viewing locations in the far north (70 degrees north latitude). So I am more inclined to suggest 30 degrees.

[Image: Possible location of the Peratt Column downstream of Earth. Earth's axis shown up and down for convenience. Not to scale. Illustration by J. Cook.]

The most northerly petroglyphs are at 57, 61, and 70 degrees north latitude in Western Europe (Norway). These latitudes have horizons which dip 33, 29, and 20 degrees below the equatorial plane of the Earth, and would be adequate for viewing the Peratt column if the bend in the column similarly angled away from the Earth's rotational axis by about 30 degrees. This is considerably more than the "10 to 15 degrees" estimated by Peratt.

Peratt suggests that the bend in the column would be seen as existing east of the point of view of the petroglyphs in Australia, which means it was seen in the sky above (below) South America. The ball plasmoids would have rotated into the sky on a daily basis. The orientation of the three causeways at Carnac point to a location below South America also. Additionally, implied in a later text by Peratt and W. F. Yao, "Evidence for an intense solar outburst in prehistory," in *Physica Scripta* (2008), is that the plasmoid was seen directly south in northern South America and at the Nazca lines site in Peru.

The bend in the columns of streaming electrons suggests that the Peratt column followed the magnetic field lines of Saturn to the edge of Saturn's lower coma, and changed direction near Earth to follow what would apparently be the magnetic field lines of Earth. Saturn and Earth have about the same magnetic field strength.

At this time the Earth's plasmasphere was shaped in response to the electric field of Saturn, so that an electrical shadow (tail) would extend far below the Earth's South Pole. Since the plasmasphere of the Earth was the result of Saturn's electric field, not its magnetic field, the angle of the Earth's southern plasmasphere tail would not coincide with the direction that electrons traveled along Saturn's magnetic field lines. That is why there is a change in direction of the Peratt column.

The Peratt column would thus approach the Earth's rotational axis at an inclination different from the Earth's axis, but would realign to the tubular edges of the Earth's plasmasphere, in effect realigning to the rotational axis of the Earth. The electrons were not destined for Earth and Peratt claims that they passed by Earth toward the north and south. No destination in the north is ever suggested by Peratt.

But the construction of the Carnac causeways contradicts the notion that the beams simply organized themselves into dispersed electrons in the north. One of the Carnac causeways, all of which point to the southwest, clearly places another circular shape in the north east. The other southwest-pointing constructions are not clear on this (and mostly destroyed). Book 11 of the Maya *Chilam Balam* suggests also that there were objects in the north, as does the *Popol Vuh*. More on these sources below. The object in the north, still shrouded by swirling plasma, will turn out to be Saturn.

... the Opossum

There should be tales and myths relating to the Peratt Column, even though these would date from memories of events starting 13,000 years before today. I was initially aware of only a few. But once I understood enough to identify the imagery, many other references started to turn up. Of course, any tales of a man or creature at the South Pole would tend to get lost in the plethora of myth which was to be generated by the northern polar column after 4077 BC. The Peratt Column never did anything significant, except to create giants in the sky and other forms as discontinuities of the electron beams.

One example initially stood out. It is from the Quiche Maya *Popol Vuh* document, written in the 16th century AD in Guatemala. The *Popol Vuh* is a recounting, in European script, of the tales of creation of the world and the genesis of the Quiche tribes. The authors make reference to old glyphic books still in their possession, and recount (and mix) events thousands of years old. See the chapter "The Popol Vuh," for a more extensive analysis, plus suggestions that the original records may have dated back to 41,000 before the present.

Hunahpu and Xbalanque, the twin hero characters of the *Popol Vuh*, are in Bat House in the Underworld, sleeping inside the barrels of their blowguns as protection against snatch-bats. Xbalanque inquires of Hunahpu how long it will be before dawn arrives. As Hunahpu peeks out of his blowgun, a snatch-bat removes his head. Hunahpu's head is later restored with a squash.

But that is the narrative. What is of interest is that Xbalanque next requests the delay of dawn from old man opossum, so they will have enough time to fashion a squash head:

And this is when it was trying to dawn, reddening along the horizon.

"Now make the streaks, man," the possum was told.

"Yes," said the old man. When he made the streaks he made it dark again; the old man made four streaks.

"Possum is making streaks," people say today, ever since he made the early dawn red and blue, establishing its very being.

The *Popol Vuh* is full of such explanations. The opossum would not have meant anything to me if I had not recalled that "opossum" is a North American Indian word, meaning "white beast," and if I had not seen Peratt's reconstruction of the column at the South Pole. There are 66 species of opossum in the Americas; none are white, although one species has a white face. The common North American species is gray. Opossums are American marsupials with a squat body and a very long hairless prehensile tail. As marsupials, they carry their young on their backs.

From a latitude above the equator, the White Beast would not have looked like a person with a mouth and eyes, as the Australians depicted the column (and as it was also depicted in Venezuela, Brazil, and Peru). In Southern Mexico, seen through the screen of the Absu, the Peratt Column must have looked like a white opossum, its back turned to the viewers, its long tail stretched behind it. It may even have seemed to be carrying its young on its back -- the two intermediate plasmoids. [\[note 5\]](#)

None of the opossum species is striped. So where do the stripes come from? Dennis Tedlock, translator of the *Popol Vuh* (1996), suggests it signifies the four solar-year names of the Maya calendar, which all start on one of only four day-names. He also suggests that the stripes represent striated clouds seen at dawn in the east. Both are likely to be true, but irrelevant here.

In the *Dresden Codex*, an illustration shows an opossum bringing in the new year, carried on his back like a trader's cargo.

The plasma column's discontinuities, mentioned earlier, are likely the result of Saturn's movement on an elliptical orbit which would bring it closer to the Sun and further away over the course of a year. The plasma stream would change with the changing potential of the Sun's electric field at the different locations. Actually, it is the plasma flow and the size of Saturn's plasmasphere which would change over the year. There might be a consequent response in the shape and size of the south polar plasma stream -- also the very reason for the discontinuities. Thus the look of a full-fledged white beast might occur annually, perhaps as

Saturn and Earth approached perihelion with the Sun. This might have been the first indication of a renewal of the year after 10,900 BC.

Certainly a cycle of seasonal changes would have been noticed anyway, since the Sun itself was probably dimly seen from Earth despite the enclosing coma of Saturn. Some sense of a progression of seasons must have been in effect, even without the delivery of the New Year by an opossum, since the Earth's axis was tilted (as today) to the Sun. But an annual appearance of the opossum may, in fact, be the genesis of the solidly embedded concept among the people of Mesoamerica, that time is delivered as if it were cargo carried on the back of a trader.

Peratt suggests that the streams of plasma in distinct bundles of light-emitting electrons would have continued past the Earth, on all sides, traveling from below the South Pole to the north -- and beyond. These would have been seen as brilliant white streaks against the black sky, passing overhead, but, may have been intermittent over the course of the year.

Peratt writes:

"Two egg-shaped plasmoids are found at 306,000 and 266,000 km, respectively. The farthest limit of the reconstruction (the top) is located 701,000 km [435,000 miles] from Earth. The number of Birkeland currents is 56 at the top, converging to 28 at the plasmoids and eventually converging and twisting into four large filaments. If the current oscillates or is sporadic, the four can separate back to 56 filaments. Whether 56 or 4, or some number in-between, the filaments flow over and past the rotating Earth."

-- Peratt, et alii, (2007) [\[note 6\]](#)

Specifically, the opossum makes four streaks. The *Popol Vuh* says so. If 28 bundles of the plasma were passing by Earth, then each area between the electron bundles would occupy 13 degrees, so that the region included within 4 stripes (and somewhat beyond) would be perhaps 40 degrees of the sky -- quite a broad view. This is some 2800 miles (4500 km) of the circumference of the Earth, but of a region further away from the surface of the Earth. It is uncertain if a view much beyond a width of 2800 miles would be possible, since the perspective toward the east and west horizon would condense additional streaks and the atmosphere would obscure any additional stripes.

Tedlock, and his Quiche informant Andres Xiloj, discuss the four cloud streaks at dawn in terms of red and charcoal black, but the *Popol Vuh* specifically calls the streaks of Possum as being red and blue. "Blue" is an ill-defined word in English, since, although blue is a very dark blue-purple color, in reference to a clear sky, the color cyan is meant. The Maya, during the Classical Era, developed the chemistry of a Prussian blue colorant, for which they gained some fame. Red, on the other hand, is easily produced from iron oxide or from Cochineal insects, found in subtropical America. Thus the authors of the *Popol Vuh* may have reached the conclusion that the streaks were "red and blue" on the basis of the inspection of ancient

painted codexes, which in turn had been recopied and re-illustrated for thousands of years. Peratt, however, also references the sight of intense auroras, seen in historical times, as composed of white bands on a red field. Lines of electrons in arc mode would best be described as a brilliant cyan blue. [\[note 7\]](#)

In Australia, as in Peru and Ecuador, all below the equator, the details of what looked like a face could be seen. For regions north of the equator such detail was obscured by the Earth's equatorial rings. The image was reduced to an animal shape. In Portugal and France the ball plasmoid was understood as a giant mound, and commemorated as a burial mound (but apparently initially constructed just as a large mound).

... the Nazca lines

Peratt notes that the "Nazca Lines," lines of paths of cleared pebbles running in straight lines for miles in the high plains of Peru (made by removing pebbles to reveal the lighter colored ground), can also be recognized as images of the same north-south lines seen in the sky. Surface lines like these occur at a number of other locations in the Americas. By means of an illustration, Peratt shows that only a few lines would have been seen overhead in Peru. Thus the four streaks made by the opossum probably represent the correct number seen in the sky. [\[note 8\]](#)

The Peratt column may have lasted hundreds of years or more. It completely fascinated and confounded humans, who for these reasons needed to draw representations in areas where the far south plasmoid was visible -- mostly high up on mountain cliffs with a southern view, but also on seashore cliffs. But nothing came of the Peratt Column. Petroglyphs continued to be carved and images based on what was seen may have recurred for thousands of years, but the south column did nothing more during all of its existence than brilliantly light up the skies and change shapes. Only a curious saying, based on the events of the remote past, remained current among the Maya, "Possum is making streaks."

As I mentioned above, Peratt has noted that some petroglyphs were overdrawn or added to "two or three times." The most likely reason for going to the extremes of climbing vertical cliff walls to recarve the images would be the disappearance of the Peratt column. After decades or centuries of announcing the New Year, if the column suddenly failed to appear, humans would have panicked, and climbed mountains to force the return of the Peratt column. (Peratt's paper mentions "three epochs where, in a flurry of activity, petroglyphs were recorded worldwide.") Book 11 of the Maya *Chilam Balam* claims that God expressed himself with the plasmoids and the column three times. (See the chapter "The Olmec Record.") There are three main stretches of causeways at Carnac pointing toward the southwest. The site of Lepenski Vir also went through three major remodelings over the course of its use, although this may be coincidence. (The Lepenski Vir graveyard is discussed below.)

I should point out that the giant burial mound at Carnac, and the similar mound in Portugal, probably represent the large plasmoid in the south, which were certainly used for burials at a later date, even though we have no clear ideas of their original use.

... creation tasks of the *Popol Vuh*

The *Popol Vuh* also gives an account of the first tasks to be accomplished at the very beginning of time and before any activities resulting in the creation:

*"the fourfold siding, fourfold cornering,
measuring, fourfold staking,
halving the cord, stretching the cord
in the sky, on the earth,
the four sides, the four corners, as it is said,
by the Maker, Modeler,
mother-father of life, of humankind."*

-- Tedlock, *Popol Vuh*

Here again we have "fourfold" operations, although this could refer to the survey of a rectangle. "Maker" and "Modeler" here are two of the five northern Gods responsible for creation, collectively known as "Heart of Sea, Heart of Lake." Tedlock notes, through his informant Andres Xiloj, that what is being described here is the measurement of the sky as if it were a cornfield or a house. It is also reminiscent of one of the sacred duties of even the earliest Egyptian pharaohs, the "stretching of the cord."

... a survey of the world from the *Chilam Balam*

Although very little detail has been released of the visual effects of the Peratt Column, we could make some guesses. I would propose, therefore, that the brilliant lines of electrons which passed over the Earth were stationary, that is, they followed the Earth's magnetic field lines, and thus the lines rotated as the Earth rotated; in effect they would be seen as stationary above any location on Earth. This presumes that the Earth's magnetic field was considerably different from what we experience today. It would have been elongated in the north and south axial direction.

If the stripes overhead were stationary, that would perhaps account for the fact that at Nazca people could spend the considerable time needed to clear the miles-long paths as representations of the lines. It would also answer to another recollected memory, among the Maya, of a survey of the land.

In the 16th-century Maya *Books of the Chilam Balam* there is a curious reference to a large surveying task, undertaken long ago, before the present "creation." This occurs in Book 11, titled by the translator Antonio Mediz Bolio "The Book of the Lineages" and by Ralph L. Roys as "The Ritual of the Four World-Quarters." (Both translated *The Book of Chilam Balam of Chumayel*, Bolio into Spanish in 1930, Roys into English in 1933.)

Roys holds that the opening page is missing and so he starts in mid-sentence, as follows:

"... the first man [idol] of the Canul family. The white 'guaje', the 'ixculun' (and) the gumbo-limbo [three tree species] are his little hut, ... The logwood tree is the hut [lean-to, temporary shelter] of Yaxum, the first of the men of the Cauich family."

"The lord of the people of the south is the first of the men of the Noh ["South"] family. Ix-Kan-tacay is the name of the first of the men of the Puch family. They guard nine rivers; they guard nine mountains."

NOTE: insertions [] from Roys's footnotes.

"Nine mountains," Roys suggests, is from "Bolonppel-uitz," which is, he writes, "probably a place-name in the south."

What is being described here? Let me propose that the three trees are the three visible ball plasmoids which are elsewhere identified as the "great white opossum" seen in the far south. The logwood shelter is composed of the overlaid nearby lines closer at hand, near the South Pole, from where the streams of electrons diverged to ride over the Earth. Peratt offers a convincing graphic of this, from the perspective of Peru, which indeed does look like a lean-to. The nine rivers, I would propose, are the nine rings of the Absu which were seen from the Yucatan, or anywhere close to the equator. The nine mountains I cannot place.

Bolio's translation, here rendered in English by Suzanne D. Fisher, is easier to read, but takes some liberties with the original text, as noted by others. (See the chapters "The Chilam Balam" and "The Day of Kan.") Bolio writes:

"The Lord of the South is the root of the lineage of the great Uc. Xkantacay is his name. And it is the stock of the lineage of Ah Puch."

"Nine rivers guarded them. Nine mountains guarded them."

There are no titles in the original, no punctuation, and no indication of where sentences start or end. Roys sees the present page as standing alone, and starts the translation of the following page as Book 2, under the title of "The Rise of Hunac Ceel to Power." Book 2 is a long piece, mostly coherent except for two interruptions which describe migrations of the Itza into the Yucatan in the 9th or 10th century AD (which may have been the Toltecs, but were remembered as the later Itza). Hunac Ceel is a 12th-century AD Itza ruler. Bolio, on the other hand, takes the present page to be part of the Itza history, but separates out the last page of the history of the Itza as dealing with a different topic (correctly so, I think).

I am detailing the context here because the page of the *Chilam Balam* under consideration stands out in three distinct ways from the "history of the Itza." First of all, if this description is part of the history of the Itza, it starts out far too early -- actually some 6000 years before

the Itza arrive in Maya territory, but clearly also from the subject matter: the intimations of early beginnings, a survey of the land before settlement, the list of mythological names and places (which are all puns and facetious attributions).

Second, the origin of a people is here placed in the south, in fact, beyond the nine rivers. The Itza, however, came from the north and west, from the Valley of Mexico (as did the Toltecs).

Third, as I will quote further below, the first major task was a survey of the land, but this would be a land of mountains -- the Guatemalan Peten region. The flatland of the Northern Yucatan was not occupied by humans until quite late, although certainly by Toltec and Itza times.

I will skip here a list of the directional colors and properties of the cardinal points -- east, north, west, and south, always in this order, and always assigned the colors red, white, black, and yellow in order, and jump to the survey of the land. The mention of the directional colors, and certain other details confirm to place the descriptions in remote antiquity. I have expanded on this in the chapter "The Olmec Record."

Next comes the surveyor, who probably needs to be directly associated with the great white opossum. Roys writes:

"11 Ahau was the Katun when they carried (burdens) on their backs. Then the land-surveyor first came; this was Ah Ppizte [Measuring Man] who measured the leagues. Then there came the 'chacté' shrub for marking the leagues with their walking sticks."

"Then he came (to) Uac-hab-nal to pull the weeds along the leagues, when Mizcit Ahau came to sweep clean the leagues, when the land-surveyor came. These were long leagues that he measured."

Bolio has, not altogether different:

"With the 'Eleven Ahau Katun' appears the retinue of their servants."

"And Ah Ppisté [Measuring Man] began to come. This Ah Ppisté [Measuring Man] was the measure of the earth. And then came Chacté Abán, to prepare the measurings of land to be cultivated."

"And Uac Habnal came to mark the measurings with signs of the herb; while Miscit Ahau came to clean the marked out lands and Ah Ppipsul, the measurer, came, who measured wide areas."

The names upon names should not worry the reader. Mesoamerican languages, like most American Indian languages are primarily action oriented, not time based. If an action happens, it has to be attributed to an agent. Additionally, as Roys points out, frequently the

names are just puns.

Katun 11-Ahau is the name of a double-decade period which is understood by the Maya as starting all history. All of history is always repeated every 13 Katuns, a cycle of about 250 years, where Katun 11-Ahau is always the first 20-year period in the list of 13. All events at the beginning of time, or in remote antiquity, or before there were calendars, are always placed in Katun 11-Ahau.

"These were long leagues that he measured" and "who measured wide areas" both show that the survey was no small project. I would suggest that we are looking at a recollection of the white stripes in the sky. To the later scribes of the Olmecs, and other peoples who came before the Maya, the recorded events suggested that the survey was done for humans, and possibly by humans, and was a necessary task before settlement of a land after a migration from the south. (The *Popol Vuh* will suggest a migration from the east.) To use this information as the opening page of the *Chilam Balam* would make sense, as would its use at the beginning of the history of the later Itza migration. It localizes the information from remote antiquity to the time and conditions of AD 1000 in the Yucatan. [\[note 9\]](#)

What is particularly important in the above is the "sweeping" of the lines and the "pulling of the weeds." This strange activity is duplicated in Neolithic England, as I will describe below.

... Ley Lines

There seems to have been a propensity in the Neolithic to forming long absolutely straight pathways, often over difficult terrain, going over steep hills when it would have been much easier to go around. Located along these lines are important landmarks -- megalithic monuments, churches, and graveyards. The lines became very obvious in England, where they were first reported, and have since been discovered in other parts of the world -- North and South America, Australia, Western Europe, and China (where prohibitions against straight-line paths are invoked under the Feng-shui philosophy). They are called "ley lines" today, and known as "doodwegen" in Dutch -- roads of the dead.

The first awareness, and first book on these (for England) was penned by Alfred Watkins in 1922, *Early British Trackways, Moats, Mounds, Camps and Sites* and is still clearly more meaningful than the present day submersion of this topic in New Age speculation. Of course, by the late Neolithic there no longer was any coherent reflection of the original north-south paths seen in the sky, and pathways were plotted in all directions. This is true of the Nazca lines also.

It might be suggested that the "sweepers" who cleared the lines in the sky in the text quoted from the *Chilam Balam*, above, were smaller nodules, small plasmoids, or electric discharge patterns, seen traveling along the lines toward the south. Alfred Watkins in his book writes about town names along Ley Lines:

""Broom' occurs with great persistence on leys, with its variations brom and bram. Bromley and Bramley, Bromton and Bramton, Bromfield (where is the Old Field with a number of tumuli), Broomsgreen, Broomsberrow, and the many Broomy Hills are examples. It is not confined to one form of sighting point, and I surmise (from a faint line of evidence) that a component part of our modern broom was an essential working implement of the skilled ley man, and was continued as the staff of the medieval pilgrim. Whether the plant broom was the original root word or a derivative I cannot say."

The word "broom" is a cognate of "bramble," a thorn bush. This suggests that a series of electric discharges (arcing) traveled south along the lines, looking like a moving dendrite pattern, directed toward Earth's mesosphere or stratosphere, 40 to 100 miles above the surface (65 to 160 km), and in constant motion toward the south. If the tendrils of the "brambles" were directed down from the streaks of electrons, this would indeed have looked like brooms were sweeping the lines, or, as the *Chilam Balam* has, that weeds were being removed. As a household implement, the broom probably dates from the Upper Paleolithic. [\[note 10\]](#)

... Catal Hoyuk murals

As I will point out in a following chapter, some murals at Catal Hoyuk which look like "designs" are actually depictions of "pinch instability characteristics" which Peratt has illustrated as laboratory plasma instabilities and as petroglyphs. For the Catal Hoyuk murals there are curious appendages added to the three beams of electrons (what would be the pinch instabilities). The three beams are shown as twisted cords.

At this time we have already discussed the Ley Lines, the Nazca Lines, and a number of other instances dealing with the lines of brilliant electrons in the skies. I have also suggested that the brooms of the "sweepers," which have shown up on two continents, are likely the heteromac appendages shown in the murals at Catal Hoyuk.

[Image: Vertical designs against a background of bricks at Catal Hoyuk. The designs can be identified as "pinch instability characteristics" depicted as petroglyphs by Peratt. Illustration after Mellaart.]

Catal Hoyuk dates from 7400 to 6200 BC, much later than the period during which the Peratt Column appeared, 10,900 BC to 8047 BC. The Catal Hoyuk appendages do not look much like brooms, but, as Peratt has demonstrated in his 2003 paper, a number of heteromacs which have been identified among the petroglyphs are rendered as figures with smaller figures attached. If these moved along the lines, they might indeed have looked like sweepers.

... God speaks to Job

The *Book of Job* is reputed to be one of the oldest books of the Bible. God, in a dialog with Job, speaks of the "chambers of the south," which is the Egyptian phrasing for the Duat ("mansions of the south"). He speaks also about the creation of the Earth, and asks Job, "Where were you when I founded the earth? Tell me, if you have understanding, who determined its size; do you know? Who stretched out the measuring line for it?"

Then the Lord addressed Job out of the storm and said: "Who is this that obscures divine plans with words of ignorance? Gird up your loins now, like a man; I will question you, and tell me the answers! Where were you when I founded the earth? Tell me, if you have understanding, who determined its size; do you know? Who stretched out the measuring line for it? Into what were it's pedestals sunk, and who laid the cornerstone, while the morning stars sang in chorus and all the sons of God shouted for joy?"

-- Job 38:1-8

The "pedestals" likely are the four pillars at the cardinal points which hold up the canopy of the sky. These, which I suspect are two magnetic polar plasma plumes and two similar forms in the east and west, I will elucidate in a later chapter.

... the stones at Carnac

In Brittany in France at Carnac is a series of causeways with 10 to 13 parallel lines of standing stones, dated from before 4000 BC. (The giant mounds date from 5800 BC.) There are three distinct causeways running from northeast to southwest (Le Menec, Kermario, Kerlescan), in line with each other, plus a number of others (Crucono, Saint Barbe) at right angles to these.

[Image: Carnac standing stones. After Wikipedia, public domain.]

At one end, the southwest, or at both ends (Le Menec) of the causeways there are remnants of large circles of standing stones.

The remnants of circular structures at both ends of the causeways would suggest that an additional circular object existed above the Earth's North Pole, which has not been identified by Peratt. I would suggest that this was Saturn as the endpoint for the streams of electrons. Saturn thus might have been visible at this time, as the *Popol Vuh* also claims (discussed below), although likely enshrouded in glow mode plasma.

In all there are some 4000 stones still standing in rows. Originally there were perhaps 10,000. The causeways near Carnac point toward the southwest, suggesting a contact point for a plasma stream in the mid-Atlantic (and thus to South America). The few shorter alignments,

running almost at right angles to these, point to the northwest instead -- as at Kerzerho, which likely represent the new stream of plasma seen in the northwest after 4077 BC. Kerzerho uses the largest stones.

The main Carnac causeways seem to be representations of the Peratt Column seen extending from the South Pole. The standing stones start at four rows in the northeast portion (which likely represent the view directly overhead), increasing to 11 or 13 rows in the southwest -- the southern view beyond the Earth (one fourth of a bundle of 56 streams of electrons would be represented by 14 rows). The rows of standing stones narrow at the southwest end, as if to suggest a diminishing perspective, despite the crowding from additional rows of stones. The stones also increase in height toward the southwest, suggesting a point of view elevated into the sky. The southwest end of the causeways also tends to run uphill slightly, in effect also pointing to something in the sky. Many causeways have a bend at the center, that is, they change direction slightly. The change in the direction of the electron streams of the Peratt Column happened somewhere within 435,000 miles (700,000 km) below the South Pole. The causeways point to the South Pole below or slightly west of South America.

"In South Australia, a bend in the plasma column far above the Earth was noted. Nearly normal to Antarctica, the column bends eastwards as seen from Australia and presents an increasingly "stretched" columnar profile for New Zealand and more so for South Africa."-- Peratt, et alii, (2007). [\[note 11\]](#)

The observations in Australia place the main body of the White Beast toward the east, and thus above South America. The direction of the electron streams seen in France, that is, the direction of the causeways, also points to South America. The far plasmoid of the Peratt Column was stationary with respect to the location of the planet Saturn. Only as the Earth rotated would the far end of the column alternately come into view and disappear again, nightly.

Over the course of a solar year, with both Saturn and Earth on equal but displaced orbits around the Sun (and the Earth below the equatorial of the Sun as well as below Saturn), the Peratt Column might have entirely disappeared from view in the daylight sky. Or the Peratt Column could have ceased to exist annually as the conditions of Saturn with respect to the electric field of the Sun changed on its elliptical orbit. This would not be reason enough for the constantly renewed recording of the phenomena in petroglyphs, causeways, and standing stones. I would think that only the complete disappearance of the Peratt Column for decades or hundreds of years at a time would be cause for new carvings, paintings, and constructions.

... Vishnu Takes Three Steps

There are suggestions based on linguistic analysis for the creation of the *Rig Veda* in Northeast India (Pakistan) in 1700 BC -- in the foothills of the Himalayas. Importantly, this location is also recognized for the earliest plant domestication in Asia, perhaps as early as

9000 BC. In fact, there seems to be no sign of a hunter-gatherer phase in low-land India prior to about 7000 BC when plant domestication appears in Central Pakistan, as at Mergharh in Baluchistan. The Harappan civilization of Pakistan dates to after 3000 BC. (Clyde Winters claims the Harappan civilization to be derived from southern Sahara or central Africa.) Although folklorists only begrudgingly attribute the creating of the Indian *Rig Veda* to 1200 BC, the *Rig Veda* clearly describes events dating back to before 10,900 BC.

Graham Hancock, in *Underworld* (2002), describes the following:

"In the Rig Veda, Vishnu's principal exploit, recounting and celebrated again and again, is the taking of 'three steps'. Although it is agreed that these steps must symbolize something of profound importance, scholars have as yet reached no consensus as to their underlying meaning."

Hancock then quotes from the *Rig Veda* as follows:

"I will declare the mighty deeds of Vishnu, of him who measured out the earthly regions ..."

"He who for man's behoof in his [man's] affliction trice measured the earthly regions."

Hancock continues with quoting various measures from the *Rig Veda*, attempting to segue this with the erroneous notion expressed by Giorgio de Santillana and H. von Dechend in *Hamlet's Mill* (1969) that the precession of the equinox was known since remote antiquity. (There was no precession before 747 BC.) But what is being expressed is exactly what happened: the Earth was being surveyed with cords strung through the skies -- three times. [\[note 12\]](#)

Peratt has suggested that some petroglyphs were overdrawn or added to "two or three times." The three groups of standing stone causeways at Carnac definitely suggest "three times," as does the *Chilam Balam* and this quoted passage from the *Rig Veda*.

... the Heart of Sky

The *Popol Vuh* lists two sets of creation Gods under collective names, separating the Gods of the south from the Gods of the north, and calling the southern apparitions the "Heart of Earth, Heart of Sky" while calling the northern apparition the "Heart of Sea, Heart of Lake." North and south are not identified, but it becomes obvious that the streams of electrons arriving at the plasmoids in the south connected to another entity in the north. The entity in the north is identified as Saturn and its companion planets mainly through the mention of one of the gods who is clearly identified as Quetzalcoatl or Venus from the name "Sovereign Plumed Serpent." [\[note 13\]](#)

As seen from Central America or Northern South America, Sovereign Plumed Serpent and

his companions are seen at the north horizon rotating out of the sea ("Heart of Sea") on a daily basis and rotating into the sky supported on the rings of Saturn ("Heart of Lake").

"Heart of Earth, Heart of Sky" in the south is identified as three members, Thunderbolt Hurricane, Newborn Thunderbolt, and Sudden Thunderbolt. These clearly are the three plasmoids of the Peratt column seen at the south horizon which rotated out of the land ("Heart of Earth") on a daily basis and rotated into the sky ("Heart of Sky"). The "Thunderbolt" names are appropriate for plasma displays, which will switch from dark mode to glow mode (or arc mode) suddenly. "Thunderbolt" is also appropriate, considering the arc mode bundles of electrons from the ball plasmoids, which, if they were sporadic, could be seen approaching and flashing across the sky like a traveling lightning bolt.

[The following few paragraphs are quoted from a later chapter.]

In *Maya Cosmos* Freidel and Schele present the imagery of a painted pot showing six Gods in council with a seventh older God. They are advising the seventh god to "bring into existence" and "put in order" the place called "black is its center" -- a fit description of the deep shadow at the center of the Absu which changed size and shape over the year.

[This is currently understood as the dark gap in the Milky Way by archaeologists.]

More quoted text:

This scene illustrates what the *Popol Vuh* recounts at great length, the negotiation of the southern and northern gods leading eventually to the creation of Earth and man. The negotiations in fact actually lasted about 2500 years, from 10,900 BC to 8347 BC.

[Image: A pottery Image: "Six gods and Jupiter. The text reads of an attempt to council Jupiter into the act of creation." After David Freidel and Linda Schele "Maya Cosmos" (1993).]

Additional quoted text:

The presiding elder God (God L) is easily identified as Jupiter as well as First Father. The six Gods have various names, of which some are easily identified. God "Three Born Together" is obviously the three plasmoids of the south and God "Nine Footsteps" is Mars. Others have identified the center figure of the bottom row as G-I which is Venus. Subtracting God "Three Born Together" of the south leaves five Gods all associated with the polar configuration of the north. This is the same number as listed in the *Popol Vuh* (see the chapter "The Popol Vuh" for details). These are Uranus, Neptune, Saturn, Mercury (but identified as Venus by Talbott), and Mars, all of which were easily distinguished in the earliest time before 10,900 BC, although some disappeared behind (or above) each other by about 5800 BC, and Venus probably did not exist as early as this council meeting is meant to depict. God L (Jupiter) is distinguished from the polar configuration planets, and we are given a rare insight: the suggestion that at the time of the council, even long before 4077 BC, Jupiter had been known and seen for eons, and therefore was properly represented as very old.

This illustrated pot again points up the Mesoamerican concept of the simultaneity of

time. The council of the six Gods happens after the First Creation of 10,900 BC (discussed below) as far as the narrative of the *Popol Vuh* is concerned, resulting eventually in the creation of the Sun and eventually the lighting up of Saturn. But the disposition of the dark spot in the Absu, in fact, the whole of the Absu, is not tackled until after the end of the "third creation" of 2349 BC (discussed in a later chapter). The six Gods had long since disappeared from view by that time.

[end quoted text]

The *Popol Vuh* recounts the three appearances of the Peratt Column as three attempts by the Gods at creation, the first two of which (mud people and wooden people) were failures. The third attempt, when people are made from maize-dough (or maize-mash), has to be dated to after 4077 BC (when the maize-dough mountain first showed up in the north).

... Egypt

The apparition at the South Pole can be equated with the God Geb of the Egyptians, who impregnates the Goddess Shu of the north via the bundles of electrons seen reaching the north skies beyond Earth. This would account also for the enormously long penis of Geb.

Alternately, the God in the south is Nebertcher ("Lord of the outermost limits"), residing in Nu, the waters of heaven (the Duat), who initiated creation at the very beginning of time (the primal time) by calling into existence Khepera, represented by a dung beetle. This particular interpretation is from a Ptolemaic era papyrus. But Khepera is first seen in the *Ogdoad*, a theology of 8 gods, dating from the Old Kingdom Dynasty 3 through 6 (circa 2650 BC to circa 2200 BC). The *Ogdoad* gods consist of four pairs of males and snake females, who first create light. Except that there are four groups, the remainder matches the three ball plasmoids of the south and their snake-like appendages. The pairs represented water, invisibility, infinity, and darkness -- suspected (by me) as much later metaphorical theology.

The larger southern ball plasmoid would certainly look like a beetle with its hairy legs, complete with a dungball in front of it. It is also amazing that this imagery was remembered for up to 12,000 years. Today mythologists assign to Khepera the task of rolling out the Sun on a daily basis. Representations of Khepera, as a matter of fact, show him (her) holding up or pushing the solid red ball of Ra -- which is actually Jupiter, but which represented Saturn earlier). Today's mythologists take Ra to be the Sun.

There are also a number of *Anneads*, theologies of 9 gods, which mostly duplicate the *Ogdoad* narratives. Reading Egyptian creation mythology in light of the knowledge of how, for thousands of years the sky was dominated by the ball plasmoids in the south and electrons streaming past the Earth to the north, will enlighten much of what today is considered as symbolic and metaphorical interpretations of "philosophical concepts" far beyond the reach of the Egyptians of deep antiquity -- "represent[ing] the primal, fundamental state of

beginnings," as Wikipedia has it. Realizing also that all of the southern display produced nothing significant until the goose and the egg showed up in the north, it is obvious why the earliest creation mythology is so foreshortened. Interestingly, the *Ogdoad* relates that when the gods of the south die, Ra of the north tends to their funerals.

In antiquity Khepera brought the first land into being by calling out its name. This suggests that the ball plasmoids came into being before the lines of electrons, which connected, as certainly the pre-Olmecs also acknowledged, to the first formless round mass of Saturn in the north. The "speaking" or "calling out" might be an electrophonic sound of the electron beams being established and possibly continuing to sound. An electrophonic sound is an electromagnetically generated sound heard within Earth's atmosphere of a phenomenon experienced outside the atmosphere, as, for example, the explosive electric breakup of a meteor.

... Lepenski Vir

The oldest cemetery in Europe is a site facing the raging Danube river at Lepenski Vir in Serbia, and dating from 6250 to 5500 BC in calibrated Carbon-14 dates (using the latest corrections). The dates are long after the three southern plasmoids had disappeared.

Archaeologist Dragoslav Srejovic, who first excavated the site, believed it to be a village. But the site has some major drawbacks. It is located on a shelf a few feet above the river, which at this location is a whirlpool (a "Vir"). The site is flooded twice a year.

[Image: Lepenski Vir excavation site; after Wikipedia.]

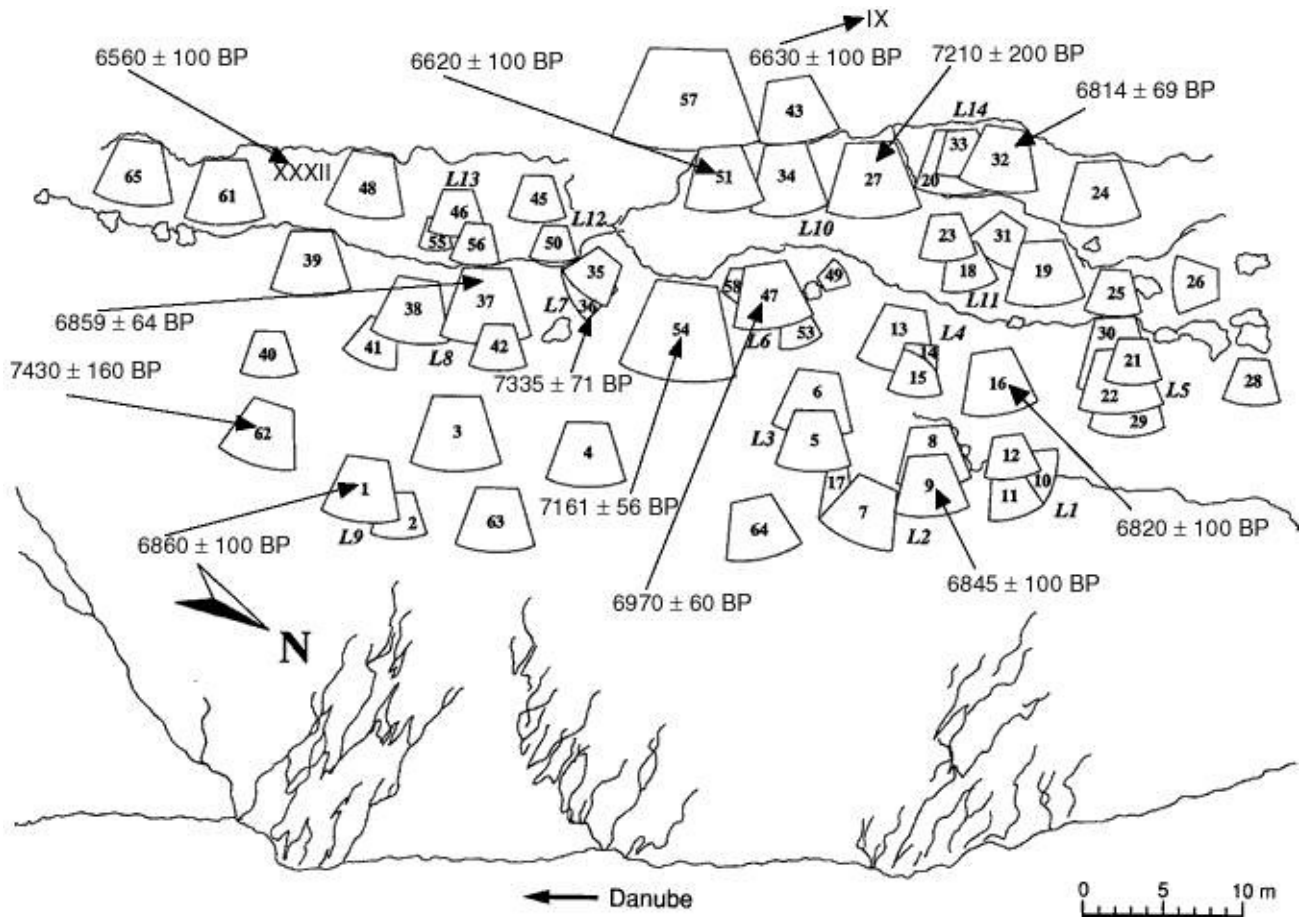

[Image: Headstones at Lepenski Vir, Serbia. After world-archaeology.com]

There are about 50 or 60 grave platforms built over the span of 750 years. The floor plans are roughly trapezoidal, and covered with calcined limestone (plaster). The structures each include a centrally located rectangular hearth, and a circular stone pit (a stone with a circular depression), and an "altar" stone which is level with the floor. The plaster floor is only an inch thick at the edges, but as much as 8 inches near the hearth, and covers all the stones defining the hearth.

The structures are 12 to 27 feet (4 to 9 meters) wide at the front and have a depth of about 9 to 20 feet (3 to 7 meters) from the front. Only the largest of these, of which there are very few, would allow walking upright past the center which was occupied by the hearth and hollowed stone. There was little room in these structures because the sides were constructed as leaning roofs, as determined by the posts-holes found in the platform plaster.

Archaeologists insist that these would accommodate five people easily, but later platforms are smaller, and none of the smaller structures would do so. It looks more like these were no bigger than what would be required to accommodate a body.

[Image: Lepenski Vir site diagram, with C-14 dates. After Radovanovic,]

I have seen book illustrations suggesting that the platforms were a village campsite (occupied for 750 years!), but most of the platforms are not large enough to accommodate even two crouching persons. It is also hard to imagine why a one-person hut would require a stone and hard plaster floor, and a central hearth which was certainly not used extensively over the hundreds of years of occupancy. The same illustration showed canoes pulled up at the adjacent beach of the Danube. There is no beach, the site is on a low cliff, and the river is all but unnavigable here because of the whirlpool.

The graves are oriented with the narrow (back) end toward the west and southwest, but a view of the west sky is everywhere restricted by high cliffs and mountains.

There are occasional skulls and bones under the stone slabs or in the ground adjacent to them. The platforms look more like exarnation floors. The platforms are thought to have been covered with thatching. They were open at the wide end and toward the narrow end, and some have a standing stone carved in representation of a fish-headed woman, naked, with clawed hands opening her vulva. At times this is reduced to just the genitalia. The standing stones at times remain uncarved. The figurative stones (and the uncarved ones) are always off-center of the structure.

The imagery here is suspected to be modeled on what is seen in the sky at an earlier time -- the Opossum of the south, the far plasmoid of the Peratt Column after 10,900 BC. The two closer plasmoids probably could not be seen from ground level. Only in one late platform are two additional fish faces added, in front of the hearth, for a total of three. The sculptures might also represent the Fat Lady in the north sky, certainly seen at earlier times, who is the model for the Venus Figurines, but I doubt that. The trapezoidal shape of the flat floor stones perhaps reflect the trapezoidal plan of many of the Nazca lines reported on by Peratt.

... Sheela Na Gig

The standing stones at the narrow end of the slabs at Lepenski Vir are the oldest stone sculptures in Europe (Göbekli Tepe in Anatolia is earlier), made by what would be postulated to be the "Original Europeans" -- preceding the "Old Europeans" identified by Marija Gimbutas and before the later Kurgan invaders (see a following chapter).

I would postulate that the farmers who invaded Europe after 5600 BC crowded the "Original Europeans" ever further westward, to end up in Western France, England, and Ireland. And, in fact, it is in Ireland, England, and Normandy that we again meet up with these images, known in Ireland as the "Sheela Na Gigs" -- carved stones set in church and monastery walls and looking almost identical to the carved stones at Lepenski Vir.

They date from at least AD 1200, but are relocated from earlier sites. This is a continuity of images spanning over 12,000 years. The concept behind the depictions, however, has been totally lost. No one knows the purpose of the Sheela Na Gigs.

[Image: preserved Sheela Na Gig, Ireland. After historicismpressions.com]

... Dilmun

The Sumerians held that the city of the Gods or the dead, Dilmun, was located in the south. (Later Babylonians held it to be an island in the north.) Dilmun is an island in the Persian Gulf, called "al-Bahrein," a name which translates as "two oceans," the meeting place of the salt sea and the sweetwater ocean of the sky.

Before 4077 BC Dilmun had probably been the island of the Gods (or the God) in the south, the ball plasmoids seen at the end of the Peratt column of remote antiquity, seen in the ocean of the Absu. Bahrein is a mountaintop rising out of the Persian Gulf. In remote antiquity a Tunnel was dug from the mainland under the ocean floor to supply fresh water to the island. It was an important place.

Ancient references to Dilmun also place it "in the east" or "where the Sun rises." Because Dilmun is identified as the land of the dead, it would be suggested that perhaps there is a very old association with the ball plasmoid at the end of the Peratt Column in the south. Then the "sun rise" would be the daily or nightly rising of the plasmoid out of the Indian ocean.

... the Fish-Man Oannes

In about 280 BC, Berossus, a priest of Babylon, brings to Greece the oldest authentic historical documents of Mesopotamia -- the *King List* and the myth of the Fish-Man Oannes, a God who preceded all the other Akkadian and Sumerian Gods. The *King List* as presented by Berossus was quoted by the Greeks of antiquity and remained the only version in use for the next 2200 years -- until the 19th century AD when cuneiform versions were found.

Oannes, related Berossus, had the face or head of a fish, and arose from the sea each day to teach mankind. This is an older mythology than the better-known tales of Marduk based on the Babylonian *Enuma Elish*, written after 1800 BC. Alfred de Grazia, in *Chaos and Creation* (1983), paraphrases Berossus from other sources:

"The Fish-Man, Oannes -- goes the legend -- came ashore among the first and savage people of Babylonia, and he taught them the human arts. He also told them the history of the world from its beginnings."

"There was a time in which there was nothing but darkness and an abyss of waters, wherein resided most hideous things...." (Another translation of the same passage says: "In the early days, before the Earth was yet made, a number of terrible beasts were the masters of the heavens.")

Interestingly, another detail is that the fish-head of Oannes was carried above his normal human head. The fish-head probably defines the middle plasmoid of the Peratt Column, where the lowest (nearest) is clearly drawn as a face in Australia and South America. At the southern latitude of Sumer the face on the plasmoid might well have been seen from under the closest rings of the Absu. The Oannes myth was Ubaid in its source, not Akkadian or Sumerian (the Ubaid culture occupied early Sumer in southern Mesopotamia). It remained in the background, for it found little duplication in other Eastern Mediterranean sources. The ocean from which Oannes rose daily is either the Persian Gulf or the Indian Ocean. It is surprising that the mythology from this era does not involve the stick-figure "squatting man," perhaps because of the location of southern Sumer at about 30 degrees latitude, except perhaps as the "terrible beasts."

The Oannes fish-man or a fish-woman occurs repeatedly among other sources, most often as a water god or goddess. Philip Coppens writes the following: [\[note 14\]](#)

"The 'Acropolis of Athens' was in ancient times known as the Cecropia, in honour of the legendary serpent-man, Cecrops, the founder and first Athenian king. Cecrops means 'face with a tail', and though often said to have the bottom half of a serpent, some sources say it was a fish-tail -- thus bearing some resemblance to Oannes of Babylonian fame. Like Oannes, Cecrops was identified as a bringer of culture, teaching the

Athenians marriage, reading and writing, and ceremonial burial."

-- [\[www.philipcoppens.com/athens_heights.html\]](http://www.philipcoppens.com/athens_heights.html)

As detailed by Joan Connelly in *The Parthenon Enigma* (2014), there were three early kings of Athens, all with tails, and all with three daughters, some or all of which were sacrificed to support Athens in conflicts with other tribes. They were named Deucalion, Cecrops ("face with a tail"), and Erechtheus. The last has a temple built to him in about 450 BC at the Acropolis. His sacrificed daughter is likely the reason for building the Parthenon ("maidens"). [\[note 15\]](#)

... Mari the spinner

Besides the inhabitants of Western France and Ireland, the Basque of Northern Spain could be identified linguistically as "Original Europeans" (see a following chapter for the "Original Europeans"). The major deity of the Basque, to this day, is the Goddess "Mari," an old woman who spins. She does not weave, only spins out threads. Her husband is a snake. She is (among other things) known as the Goddess of the oven (or hearth). Like Oannes, she is associated with wild animals. This again looks like the plasmoids and the Peratt Column in the south.

... Neith of the arrows

The Egyptian Goddess Neith, although equated at later times with Isis, is of greater antiquity than Isis and is mostly associated with the western delta region, but recognized throughout Egypt. All of the first dynasty queens take her name. She is associated with weaving (rather than spinning, and wears a shuttle as a headdress at times), creation, and water. The North African Berber nomadic civilization would explain her genesis and attributes best as the Berber Goddess Ta-Nit. In Ghana her name among the Akan is Ngame, which means "shining one" or "brightness." The Akan believe that in the beginning a Mother Goddess, visible in the sky like the moon, gave birth to the universe. As with Neith, who is the mother of Ra, she too is the Mother of the Sun. Creation was started by shooting arrows infused with life across the universe.

Among the Egyptians, Neith was described as sending sparks into the waters of Nun to create life from the inertness of the primordial waters. Nun is in the north. She is described also as the Mother of the Sun God Ra -- Saturn as the Sun. Neith's symbol is two arrows crossed like the letter X, which is true of Ngame also. In early dynasty periods, Neith was referred to as "Opener of the Ways."

The reader will recognize the "shining" and "brightness" in the sky as the southern plasmoids. Similarly the arrows and the "ways" clearly are the streams of electrons. She thus was also associated with care of the dead. We can recognize the "ways" as the electron beams

from the far south, along which the dead traveled.

It is amazing that this single Goddess can be recognized throughout all of North Africa. But as these people were all witness to the same signs in the sky, it is perhaps not so unusual.

... the magic mountain islands

In 219 BC Hsu Fu, with the blessing of the emperor of China, sets out with ships to discover, as his petition read:

"... the three magic mountain islands, Pheng Lai, Fang-Chang, and Ying-Chou, inhabited by immortals ... in the midst of the Eastern Sea.

Paraphrasing from the original Chinese source, the *Shih Chi (Records of the Grand Historian)* of circa 90 BC, a compilation of history from 2600 BC through 100 BC, Joseph Needham, in *Science and Civilization in China* (1979), writes:

"These three holy mountain isles were reported to be in the midst of Po-Hai [the near Pacific], not so distant from human habitations. ... Many immortals live there, and the drug which will prevent death is found there, but the difficulty is that ... before you have reached them ... these three holy mountain isles sink down below the water."

We know better. We know that the three islands sank below the waves on a daily basis. We know that from a perspective above the equator the islands floated in the celestial sea of the Absu, and as they sank below the waves, they in effect sank from sight below the horizon.

... the *Kojiki*

The first compilation of myths and history was made in Japan in AD 628 and published on imperial orders, and named the *Kojiki* -- *The Record of Ancient Matters*. Unlike the Chinese *Shih Chi*, this history starts much earlier. The opening lines, under the heading of "The Beginning of Heaven and Earth," identify the names of three Gods, and two additional deities born next from "a thing that sprouted up like unto a reed-shoot," at a time when the Earth "drifted about medusa-like."

"The names of the deities that were born in the Plain of High Heaven when the Heaven and Earth began were the deity 'Master of the August Center of Heaven,' next, the 'High August Producing Wondrous' deity, next, the 'Divine Producing Wondrous' deity."

"These three deities were all deities born alone, and hid their persons."

"The names of the deities that were born next from a thing that sprouted up like unto a reed-shoot when the earth, young and like unto floating oil, drifted about medusa-like, were the 'Pleasant Reed Shoot Prince Elder' deity, next the 'Heavenly Eternally Standing' deity. These two deities were likewise born alone, and hid their persons."

"The five deities in the above list are separate Heavenly deities."

-- *The Kojiki*, B.H. Chamberlain, tr., (1882)

The first three gods of the *Kojiki* have to be the three plasmoids mentioned in numerous other mythical histories, and identified as three in number by Peratt. The "next" two gods "sprouting unto a reed shoot" are likely the appearance of Saturn, the "Heavenly Eternally Standing" deity, and Uranus, the "Pleasant Reed Shoot Prince Elder" deity. The sequence suggests that Uranus appeared before Saturn clearly showed.

... Cerberus, the guard dog of Hades

Cerberus is the dog who guards the gates of Hades, letting the dead in, but not out. His name may have derived from the name of one of the dogs of Yama, and translates as "Spot." Yama is an early Vedic god of death. About the use of Cerberus in Greek literature of antiquity, Wikipedia writes:

"The depiction of Cerberus is relatively consistent between different works and authors, the common theme of the mane of serpents is kept across works, as is the serpent's tail. Most literary works of the era describe Cerberus as having three heads."-- Wikipedia

The reader will at this point recognize the three ball plasmoids as the three heads, the

congestion of lines of electrons crossing over the plasmoids as a mane of snakes, and the extended lines pointing to Earth as the serpent tail.

Hades, of course, is where the dead go.

... the Phoenix bird on fire

Slightly less easy to recognize, but of a much wider geographical distribution, are the varied stories of the Phoenix bird, who rises up from the ashes of setting itself on fire at an interval of 300 to 500 years (500 or 540 years per de Santillana, from Chaeremon, AD 30 to AD 65). The mythology of the Phoenix occurs in Egypt and in the Eastern Mediterranean, in Arabia, Persia, India, and China (but not in lands below the equator). It is always a bird, at times a very large bird or a bird of prey, and generally with a long tail. It is colored cyan.

This suggests that the Phoenix, as the ball plasmoid, moved into position, that is, it lowered from the location of Earth (or likely, further north) to a position below the South Pole. The reverse of this might be the equivalent of setting itself on fire. On collapsing, which apparently happened periodically, the southern plasmoid would move north, past the Earth, and briefly engulfing the Earth in the process. The travel from the south and the travel to the north would be seen, for these entailed vast distances. The movement close to Earth and past Earth would not be seen since this happened likely at speed of 1000 miles per second (1600 km per sec). The Earth is 8000 miles (13,000 km) in diameter.

The *Popol Vuh* specifically notes that the three gods of the south visited the five gods of the north three times to undertake negotiations concerning creation. This would be the three collapses of the southern plasmoids.

In the Eastern Mediterranean the name "phoenix" is the color purple (as the Phoenicians were also associated with). Purple or violet is the color of the light of an electric arc.

There will be many other Gods and Goddesses of antiquity all identifiable as the ball plasmoids -- with snake tails, snakes for hair, and in families of three. Medusa the Gorgon is one of three sisters, has snakes for her hair, and could not be looked at -- not because the viewer would turn to stone, but because of the blinding brightness.

... the Pacific Islands

The date of 5000 BC given by Peratt, or even the range of "10,000 BC to 2,000 BC," contradicts what we think we know of the colonization of the islands of the Pacific. There is not a single sign of human occupation on any islands east of the Solomon Islands before 1200 BC. After 1200 BC, Fiji, Samoa, and Tonga are reached, but the Cook, Society, and Marquesas islands are not reached until AD 600. Hawaii is settled later and Easter Island not until AD 900. There are no signs of humans on any of the Central or Eastern Pacific islands except for one thing: the thousands of indelible petroglyphs dating from 12,000 years ago -- left behind by an earlier population which had been swept off the islands *en masse* in 3147 BC and again in 1492 BC. The petroglyphs appear by the thousands throughout the Pacific islands, including Hawaii and Easter Island. In later chapters I'll discuss the flood of 3147 BC and the compressive electric field impact of 1492 BC in the Central Pacific.

... Muspelheim from the *Younger Edda*

The *Younger Edda*, written in Iceland in about AD 1200, and passed on through the 15th century, in a number of copies, relates also the bright lights of the far south. The original text is probably Danish, and we know from Peratt that the plasmoids of the south were seen at a north latitude of 70 degrees in Norway, north of Iceland and well north of Denmark. Speaking of existences before the Earth was created, the *Edda* reads:

"Many ages before the earth was made, Niflheim had existed, in the midst of which was the well called Hvergelmer, whence flow the following streams..."

This is followed by a list of 12 names. The reader at this point will recognize that Niflheim, "Mist Home," as Wikipedia obligingly translates, is Saturn enshrouded yet in mists, and from it flow what looked like some 12 streams, headed south as the only direction away from north. These were probably 14 streams, and as such were the electron beams from Saturn headed south past the Earth and to the ball plasmoid below the South Pole. Only the inhabitants of the far north would have noticed that the "rivers" started from a location above the pole. That Niflheim was in the north, the remainder of the paragraph makes clear (not quoted here).

The *Edda* continues with a description of the southern ball plasmoid:

"Still there was before a world to the south which was called Muspelheim. It is light and hot, and so bright and dazzling that no stranger, who is not a native there, can stand it."

The *Edda* continues with a description of the course of the streams to the south, and how they frosted up and overlaid each other "clear into Ginungagap" -- where the last name translates as "the yawning abyss." To certify the identity of the Abyss with the Absu -- the equatorial

bands -- the *Edda* continues:

"But the south part of Ginungagap was lighted by the glowing sparks that flew out of Muspelheim. ... And when the heated blasts from Muspelheim met the rime [of the rivers], so that it melted into drops, then, by the might of him who sent the heat, the drops quickened into life and took the likeness of a man, who got the name Ymer."

[Image: Petroglyphs of plasmoid streamers forming into the image of the "squatting man" giant; after Peratt.]

Ymer was the first giant. The *Edda* continues with the generation of additional giants, the creation of a celestial cow, which formed four milk streams, and much else, mixing events separated perhaps by hundreds or thousands of years into a single creation epic with many additional details, all before the creation of the Sun, the Moon, and the stars. Much of this can be located in time or associated visually with the expected looks of the skies after 10,900 BC, but that is not my purpose here.

... dates for the plasmoid

Dates from these sources, unfortunately, are almost entirely missing, and Peratt has yet to publish any estimates of dates. Only Book 11 of the *Chilam Balam* suggests a date of 8347 BC as a ending of the "first creation" -- where the "first creation" has to be recognized as the first blazing of the three ball plasmoids. This most likely started in 10,900 BC.

This measure is based also on the coincidental interruption of the count of years at 13 Baktuns in 3147 BC, when Mesoamerica claimed the end of a "second creation." Thirteen Baktuns before 3147 BC brings us to 8347 BC. Thus the first episode (10,900 minus 8347) lasted 2553 years.

The other significant indication, long overlooked, is the fact that any number of Maya stelae, which proudly display their important local event dates, start out by first introducing the "start of creation" with:

"13 Baktun, 0 Katun, 0 Tun, 0 Uinal, 0 Kin, 4-Ahau 8-Cumku, was (first) seen the image."

At times the reference is simply to "an event" or the fact that 13 Baktuns were completed. At times only the day names of "4-Ahau 8-Cumku" are used. Some stelae reference the setting in place of the three celestial hearthstones, an event which could also describe the aftereffect of the fall of the Absu in 2349 BC (end of the "third creation").

But a number of stelae spell out what the "image" was -- it was the "image of the turtle" which was first seen at the start of creation. I should point out also, that sculptures of turtles are frequently seen in the archaeological sites along the Pacific coast of Guatemala, many of which predate the first Olmec sites of Mexico. What these turtles symbolize has remained obscured to archaeologists.

The Maya conflated the end of "first creation" (8347 BC) with the end of the "second creation" (3147 BC), as is typical for a people who considered time -- or the effects of time -- as repeating. Under this condition the first appearance of the turtle is the first appearance of the southern plasmoid. We have nothing concrete to suggest the first appearance of the three plasmoids except two things: First, that directly after 10,900 BC Earth was in electrical contact with Saturn -- as shown by the destruction of North America. Second, that the Maya and others in Mesoamerica recognize the completion of event, not the start. Thus 8347 BC (13 Baktun before 3147 BC) was likely the completion of the first creation.

I think we can thus place the first showing of Peratt's southern plasmoid in 10,900 BC with some confidence. In the iconography of the Maya, the "turtle," which appeared in 10,900 BC, at the time of the (start of) "first creation," is often combined with the appearance of Jupiter ("Hun-Nal-Ye") as the "First Father" at the time of (end of) the "third creation" in 2349 BC. The "third creation" was probably the most important event of the past to be endlessly celebrated in Mesoamerica. It was understood that, just like the second and third southern plasmoids would seem to have appeared out of the carapace of the "first turtle" sometime after 10,900 BC, so the First Father was known to have risen out of a split turtle carapace in 2349 BC (representing the gap in the Absu at the time of the equinox), assisted by Hunahpu and Xbalanque (displaced from the era of the 7th century BC). This scene is repeatedly shown on bowls and vases.

As I will expand on in following chapters, in 4077 BC Saturn went nova and lit up to be the "sun" for the next thousand years. Before that time Saturn had already connected to Earth with streams of electrons -- rather than bypassing Earth.

... the End of the Peratt Column

After 4077 BC Earth would be (more or less) below the south pole of Saturn, and as Saturn went nova, a plasma column would start up, now in the north, with its top seen rotating around the North Pole. When Saturn went nova, the shroud of plasma in glow mode disappeared at the same time. For people of the northern hemisphere Saturn and its satellites would be plainly visible, and this certainly did not require a perspective high up a mountain cliff. Many of the earlier images might recur. The images, again as discontinuities in a plasma column, would mostly be the same. I suspect, however, that this configuration remained consistently in place. It did not disappear periodically. The very obvious result was that they were not carved and painted as the Peratt Column in the south had been.

Although I suggested "a thousand years later" above, this is not at all certain. The standing stones at Carnac take a sudden and radical turn in the direction in which they point, from southwest to northwest, with the construction of two shorter causeways. This would have happened perhaps sometime after 4077 BC. The continuity of construction would make sense if there were also periods of time after 4077 BC when the blazing of Saturn was interrupted.

Endnotes

Note 1 --

Anthony Peratt, "Characteristics for the Occurrence of a High-Current, Z-Pinch Aurora as recorded in Antiquity," (Institute of Electrical and Electronics Engineers, *Transactions on Plasma Science*, 2003), and "Characteristics for the Occurrence of a High-Current Z-Pinch Aurora as Recorded in Antiquity Part II: Directionality and Source" (IEEE *Transactions on Plasma Science*, 2007).

The first paper matches some 84 categories of petroglyphs in form to known instabilities of laboratory produced plasma streams. The second paper records the universal southerly field of view for the petroglyphs and the minimum elevation required for observation.

What size were the ball plasmoids? The *Chilam Balam* notes that they (or it) measured "a handspan," which could represent the width of the first two plasmoids or the third and largest plasmoid. The first two plasmoids were widely suggested to be heads or faces; the third plasmoid was more likely held to be a headdress.

"Kin Pauahtun [Kan Pauahtun, the wind-god of the south] was their priest. He commanded the numerous army which guarded Ah Hulneb [the Archer] at Tantun in Cozumel, (also) Ah Yax-ac [first turtle], [a] chinab [a handspan measure], and Kinich Kakmo [fire macaw]."

The word "chinab" is capitalized in the translations of the *Chilam Balam* books done by Ralph Roys and Antonio Mediz Bolio, making it look like part of the previously identified entity. A handspan measures four or five degrees in the sky at an arm length. That's really big -- it is visually ten times the diameter of the Moon today.

The first two plasmoids are at 165,000 and 190,000 miles (265,000 and 300,000 km) from the South Pole. (By comparison, the Moon is located 250,000 miles away from Earth.) Multiplied by the arctangent of 5 degrees makes the second plasmoid twice as wide as the Earth. If the handspan applies to the third plasmoid located 435,000 miles (700,000 km) from Earth, it would represent an object more than four times the width of the Earth **[435000 * atan(5/deg) = 37864 miles]**. The Earth is 8000 miles wide.

[\[return to text\]](#)

Note 2 --

The "first creation" can be distinguished from the "second creation" ending in 3147 BC and from the "third creation" ending in 2349 BC. This last event is the Christian "flood of Noah." The information of when the turtle first showed or when the three stones were placed would have been from of the record of remote antiquity, from Olmec sources, since the Maya

themselves were mostly invisible before about 500 BC.

Note 3 --

In a presentation co-authored between A. Peratt, M.A. van der Sluijs, and D.A. Scott, and presented at the *American Physical Society*, April 16, 2005, there is an additional clue that this is not an aurora, but something immensely larger. The talk (and paper) is titled "Evidence of an Influx of Interstellar Plasma from Archaic Z-Pinch Recordings." The use of the word "interstellar" in the title takes it beyond any effect generated by the Sun.

However, in a publication co-authored with W. F. Yao, "Evidence for an intense solar outburst in prehistory," in *Physica Scripta* (2008), Peratt and Yao claim petroglyphs in Venezuela as representing "*mankind's visual observations of ancient aurora as might be produced if the solar wind had increased at times between one and two orders of magnitude, millennia ago*," after a suggestion by T. Gold in 1962.

Although hinting that this might represent a coronal mass ejection 10 to 100 times as strong as has ever been experienced in recent times, neither the missing evidence nor the logic stand up to such a peculiar and long-lasting event. The use of the simile "as might be produced if" cannot be neglected. Yet by the time the authors reach the "conclusion" of this paper, the "coronal mass ejection" is held as fact.

Peratt and Yao also discuss the Nazca lines. Like Ley Lines, the Nazca lines (discussed in the text) were overdrawn for thousands of years after they no longer showed in the sky, and today are aligned to all points of the compass.

[\[return to text\]](#)

Note 4 --

In "Evidence for an intense solar outburst in prehistory," in *Physica Scripta* (2008), Peratt and Yao also describe the phenomenon as, "*an intense Z-pinch whose relativistic electrons were directed towards Antarctica and hypervelocity protons [traveling] towards the Arctic.*" In both cases these were directed from the space away from Earth.

Recognize that the direction of the electrons, "directed towards Antarctica," (that is, north bound from the ball plasmoids) and protons, "towards the Arctic" (that is, south bound from Saturn), would be correct if Saturn came in from the far reaches of outer space at a coulomb charge much more positive with respect to the Sun's electric field.

[\[return to text\]](#)

Note 5 --

Typically a "face" is found on decorated objects south of the equator, like the mug below.

They are distinguished from other paraphernalia by the snake hair.

North of the equator the details of the plasmoid would have been obscured by the Earth's equatorial rings. The Olmecs, or their predecessors, would report on different images -- a turtle, an opossum, and three stones on fire.

[Image: Plasmoid face and engraved cup from Peru; after Peratt and Yao.]

[\[return to text\]](#)

Note 6 --

The wording is not completely clear. I presume the references to 56 and 28 Birkeland currents relates to what existed in space, below the South Pole of Earth (up in the sky), and the reference to four streams relates to what was seen overhead at any location on Earth. This is congruent with the four stripes of the opossum, and also with the construction of the causeways in Carnac, which number 10 to 13 parallel rows, but start at four rows in the northeast.

Additionally I assume that "the filaments flow over and past the rotating Earth" does not mean that the Earth rotated within the filaments, but that both rotated together. This seems to imply that the filaments away from the Earth (below the South Pole or above the North Pole) also rotated with the Earth's magnetic field lines. But this might not be true.

The breakup of any plasma stream of considerable magnitude into 56 or 28 bundles is an inherent feature of plasma. It can be seen in lab experiments as well as at the stellar level. (See, for example, images of a nova event of 1987, listed as SN1987A, which by 2003 clearly shows a ring of 28 bright spots -- where the telescopic image is aimed directly into the flow of plasma exiting the star.)

[\[return to text\]](#)

Note 7 --

The red background is from excited low-level Oxygen molecules at altitudes in excess of 300 miles (500 km) above the Earth.

[\[return to text\]](#)

Note 8 --

The Nazca lines, and other sets like this in North America, England, and China, have been augmented with additional lines and figures into historical times. It is obvious that the original meaning of the lines was lost over the last 10,000 years. But everywhere they are still associated with the dead.

[\[return to text\]](#)

Note 9 --

There is a similar mention about measuring the land in Book 11 of the *Chilam Balam*. Book 11 details the world before the creation of God the Father, and ends with a paragraph which clearly describes the creation event of 4077 BC, Saturn going nova. The mention of the White Beast, rendered totally obscure through an effort to Christianize the original text, reads as follows (from Roys):

"Bolay [beast] was the name of the serpent of the second [other] heaven. He was in the dust at the feet of [that is, below] Sustinal Gracia [sustinal grace, Saturn in the north], as he was called. Then Lonmias was formed. The sharp stone was his stone within the night. Zihontun was his stone, when these stones were fixed in their places."

"Three times they were set at the foot of Sustinal Gracia. These stones were born, they were beneath the one stone, the mighty pointed stone [Saturn], the stone column, the mighty pointed clashing stone. They were manifested [shown or seen] all over the world (by) God the Father, the first ruler."

-- Roys (1933)

The count of stones "below" Saturn, that is, at the other end of the sky, are three: Bolay, Lonmias, Zihontun. They were set "three times."

Bolio's translation abbreviates the sense of "three times" with:

"... the three Stones that were to be seated at the feet of the Sustinal Grace. The stones that were born were beneath the First Stone. And they were equal sisters."

-- Bolio (1930)

"Bolay" is a Mayan word meaning "beast," reminiscent of the "White Beast" -- Opossum. Bolay is identified as a serpent in Roy's text.

[\[return to text\]](#)

Note 10 --

The occurrences of "fractal, dendritic structure(s)" in compressed streams of excited electrons is mentioned by Peratt, attributed to A. B. Kukushkin and V. A. Rantsev-Kartinov, in "Self-similarity of plasma networking in a broad range of length scales: From laboratory to cosmic plasmas," in *Review of Scientific Instruments* (1999). The patterns are identified as "heteromacs." Peratt notes that "heteromacs can include filamentary, cellular, and bubble-like clusters." These would certainly qualify as looking like people and animals moving toward the grave mound in the far south.

See also [\[www.pauldevereux.co.uk/\]](http://www.pauldevereux.co.uk/) by Paul Devereux on Ley Lines.

[\[return to text\]](#)

Note 11 --

That would make the bend in the column appear above the south Pacific, and somewhat west of South America. The oldest giant statues of Easter Island (west of South America at 110 degrees longitude), all placed in a line just south of the Rano Raraku quarry, face to within 20 degrees of south.

[\[return to text\]](#)

Note 12 --

Graham Hancock, in *Underworld* (2002), attributes the flooding of the coastal plain of India to glacial meltwaters after about 10,000 BC. This seems far too early for hewn stone structures and walls. I would suggest the flood of 3147 BC.

[\[return to text\]](#)

Note 13 --

I do not think Venus made an appearance before 4077 BC. But both in the *Popol Vuh* and in depicted mythological subjects, the Maya, because of their well-established concepts of a repeating cycle of time, tended to lump together events from distinct eras. It is more likely that the planet identified as "Sovereign Plumed Serpent" is Mercury. Both would have looked the same with their comas, except for the magnetic field of Mercury which shaped the incoming plasma stream from Saturn. The retelling of creation was from graphical codexes, as the authors make clear. Because of these records the Maya and their predecessors seldom made mistakes in the recounting of ancient history.

[\[return to text\]](#)

Note 14--

From Wikipedia, as a single example among hundreds:

"In Irish mythology, Danu ... is the mother goddess of the Tuatha de Danann ('The people of the goddess Danu')."

"The [name] is of Proto-Indo-European age, and seems to have denoted a water goddess in origin. A goddess Da-nu is attested in the Rigveda, and also the river names Danube (Latin: Danuvius), Dniestr, Dniepr and Don derive from the name."

"The Rigvedic Danu was the mother of a race of Asuras called the Danavas. A shortened form of the name appears to have been Da-. This form survives in Greek as Damater (Demeter, "mother Da"), in origin also a water goddess. The Proto-Indo-European da-nu probably meant 'fluvial water, running water'"

Interestingly four adjacent north-south rivers, flowing into the Black Sea, are each named after Danu, as if representing the four electron beams.

[\[return to text\]](#)

Note 15--

There was no flood of Deucalion, only rain as confirmed by most legends. That matches the conditions reported both in the *Popol Vuh* and by archaeologists for the period directly after the compressive slam at Hudson Bay in 10,900 BC -- the start of the Younger Dryas cold snap.

Connelly dates the prehistoric events to 1200 BC, which is the establishment estimate for the fall of the Mycenaean Greek culture and the start of 700 years of Greek "Dark Ages." But the sacrifice of Erechtheus's daughter (or daughters) dates not to 1200 BC, but to the time of the last collapse of the three southern plasmoids in 8347 BC, and thus some 8000 years before the building of the Erechtheion and the Parthenon.

AU == 93,000,000 miles.

Recovering the Lost World, A Saturnian Cosmology -- Jno Cook

Chapter 11: Time Line and Gimbutas.

\$Revision: 42.43 \$ (gim.php)

Contents of this chapter: [\[The Hypsithermal\]](#) [\[Chaos and the Birds\]](#) [\[The Saturnian Planets\]](#) [\[Venus Figurines\]](#) [\[Neolithic Figurines\]](#) [\[Objections to Gimbutas\]](#) [\[Endnotes\]](#)

The Hypsithermal

From about 7000 BC (when the shadowed skies of the Younger Dryas had cleared) the Earth experienced a climatic condition known as the Hypsithermal (also called the Holocene climatic optimum). Warmer conditions prevailed everywhere. The Hypsithermal lasted to about 3000 BC, followed by a similar mild climate extending to about 2000 BC.

What had ensued was a truly strange situation. Earth's orbit was entirely below Saturn's orbit, and thus below the Sun for all of Earth's year. At first, this would have involved the relocation of the Earth some 10,000,000 miles (16,000,000 km) or more below Saturn and below the equator of the Sun. The Sun would not be at one of the two centers of the ellipse which normally defines a planet's orbit. The Sun would remain above the equator as the Earth traveled on an orbit below Saturn. The northern hemisphere would have received more sunlight year-round. The world would not have been exposed to the drastic changes in seasons we experience today. Thus, as the shadow of the Younger Dryas lifted, the climate would have improved. But not everywhere: the southern hemisphere would have remained in a fall and winter condition. [\[note 1\]](#)

The Hypsithermal is somewhat of an anomaly, for if Earth were only a few million miles below Saturn, there would have been only a few degrees difference in the dislocation of the Sun from the equator. But instead we see an apparent northerly relocation of climatic zones on the order of 10 to 15 degrees of latitude. This can be found from climatic descriptions during the initial few thousand years of the Hypsithermal. This presumes that the Sun stood some 10 or 15 degrees higher in the sky, so that the tropic zone in Africa was defined as the region of the Southern Sahara. To achieve this condition, the Earth would have had to have been some 10 or 11 million miles (16 million km) below the orbit of Saturn, a considerable amount. This might have been an initial condition at the start of the Younger Dryas. As time went on, the Earth would have lifted in latitude with respect to Saturn, so that by 4077 BC

the separation might have amounted to only 2 or 3 million miles.

[Image: Saturn with Mercury, Mars, and Earth. Illustration by J. Cook.]

At the time of this writing I had already posited the movement of planet Earth from a location at an equatorial level of Saturn (or somewhere adjacent and below) to a position considerably below the south pole of Saturn, which would have changed the northern climatic zones. I then happened on Charles Ginenthal's essay "The Extinction of the Mammoth" (1997) and at once realized that the evidence he presented matched my expectations for the climate on Earth during the period after Earth had moved in its orbit below the Sun after 10,000 or 9000 BC. [\[note 2\]](#)

Ginenthal deals mainly with the Arctic climate, which, after 9000 BC, warmed enough that trees and grasses grew in the Arctic region and the polar and subpolar lands were populated with herds of mammoth and other large animals (rhinoceroses, horses, beavers, 12 species of elephants). The preceding ice ages had ended about 2000 years before the Younger Dryas and before it got cold again, and the Arctic had consisted earlier of frozen ground covered at best with tundra, as it does today.

There are parallel changes in the Earth's climate during this period, often presented as global, although they clearly are not global. Climatic changes have been studied in the context of today's condition, and it has thus assumed that the changes represent a general warming of the whole Earth. Investigations have also mainly concentrated on the northern hemisphere and the tropics. All of the available data on the climate during the Hypsithermal can be accounted for by understanding that, with the sun now continuously high in the skies of the northern hemisphere, the "tropic" zone moved north. I would estimate that the tropic zone moved between 10 and 15 degrees of latitude north. Thus the Southern Sahara received the moisture usually reserved for the tropical zone, a dry zone developed at about the level of the Northern Sahara and further north into the Mediterranean region, and the temperate zone

moved up into the sub-arctic regions. [\[note 3\]](#)

[Image: Winter and summer during the Hypsithermal. Illustration by J. Cook.]

Data from the Hypsithermal period, in fact, indicates that the tropical regions of Africa and South America (the Amazon region) received between 30 and 70 percent less rain than today. However, most of the Sahara bloomed, except the far northern portion, with large lakes and flowing rivers, and was populated by a great variety of tropical animals (and humans). The period is known today as the "Green Sahara" period, starting in about 8000 BC. [\[note 4\]](#)

The Levant fell in the dry zone and was completely depopulated for periods of hundreds of years. Southern Europe fared only a little better. Northern Europe, Asia (Siberia), and Northern America (Canada) experienced a temperate climate which extended into the Arctic.

All the northern glaciers melted rapidly, except for the glaciers on high mountains. These mountain regions include all of Greenland, the mountains in the south of Alaska and Western Canada, some mountain regions in the far north of Norway, and some of the high Alps. The glacier in Antarctica did not melt, not just because Antarctica is mountainous, but because the South Pole remained in almost complete darkness.

Chaos and the Birds

The frequent depiction of seated birds in late antiquity (8300 or 6000 BC to perhaps as late as 4077 BC), culminating in the seated falcon on top of the Egyptian sereks -- the name labels

of the pharaohs.

Perhaps even long before 10,900 BC, Saturn would have been seen starting to drift toward the north side of the sky, from above the Earth's equatorial, to eventually be seen rotating in a 5 degree circle around the celestial North Pole. "Revolving without cease," as more than one creation myth records. The visual effect of this, at any rate, would have been to see a large object travel from east to west across the sky on a daily basis for thousands of years before 10,900 BC, and certainly thereafter. This is the Egyptian Horus the Hawk, as a seated bird seen in profile -- not with spread wings. We would expect many representations in miniature forms, and in fact there seems to be millions of seated bird forms throughout the world, some of which can be fairly closely dated. [\[note 5\]](#)

As Earth came closer to Saturn, the distinct form of a hawk would have been replaced by a swirling clouded sky. (The coma of Saturn may have come and gone periodically.) As Earth took up a station below Saturn, the "egg" (or first probably the duck, as the Egyptians identified it) appeared in the fluffy cloud above the north horizon. It has been noted repeatedly in mythological sources that the egg "rotated without cease." This describes the path of the egg in the sky, not its rotation about itself, which probable could not be discerned. This condition would have lasted some 700 years, says the *Kalevala*.

As the Finnish *Kalevala* records:

*"Ilmatar, the virgin of the air,
leaves the loneliness of the sky
and moves down to the sea,
where the wind impregnates her.
She drifts upon the waters for 700 years."*

The same ceaseless rotation is recorded for Saturn, after it lights up in 4077 BC, in Vedic and Mexican sources. The Maya *Chilam Balam* states:

"He shall walk abroad giving the appearance of one drunk, without understanding."

The drunk walk is best explained by suggesting that, although Earth was located below the pole of Saturn, the rotational axis of Earth and Saturn did not coincide. Thus from Earth's perspective, Saturn wobbled about in the sky on a daily basis. The Quiche Maya *Popol Vuh* maintains a daily rising and setting of Saturn out of the sea. Ilmatar also is noted as moving in a giant circle. The interaction of the magnetic fields of Saturn and Earth might have been sufficient to eventually move the spin axis of Earth to be coincident with the spin axis of Saturn. However, this apparently never happened. What seems more likely is that Saturn, Mars, and Earth all had the *same period of rotation* before 3147 BC.

After Earth joined Saturn on an elliptical orbit, the planet Jupiter would have been seen periodically in the night sky, as when Earth was on the part of the orbit which took it inside

the orbit of Jupiter. Jupiter, when it was seen in the sky, remained at the level of today's ecliptic, although, as seen from Earth, this would have been in the skies well above the equatorial. Jupiter would have looked like a Moon, a full lighted (or nearly so) round globe, somewhat smaller than the Moon looks today. Since Earth traveled below the ecliptic, Jupiter would have looked like an egg. When Earth was outside Jupiter's orbit only the lower portion of Jupiter would be seen (in the day sky), consisting of two upfacing horns like cattle. This last image is the "bull of heaven." [\[note 6\]](#)

There are ample sources in mythology which confirm this confusion of Jupiter with the Moon. Hesiod, one of the first writers in Greek, in circa 650 BC places the genesis of the Moon even before that of Venus and Mars. The actual Moon's birth, from out of the bloodied foam of the "sea" where the genitals of Uranus ("father sky") had been tossed, happened in 2349 BC, when the Absu turned blood-red, and the Earth moved out to the orbit of the Moon. Hesiod wrote that the genitals of Uranus "were swept away over the sea a long time." Egyptian myth also talks of the loss of the genitals of Osiris directly after the collapse of the Polar Configuration. Similarly, the semi-historical script at the Temples of the Cross in Palenque, Mexico, in AD 700, notes that the Moon was born before the beginning of the current era, before 3114 BC. This last, however, was Jupiter seen in the neighborhood of Earth and about the size as the later Moon. This is also what Hesiod has reference to.

The Saturnian Planets

This model of planetary interactions, as it has been developed thus far, is obviously speculative. The locations and orbits are imagined possibilities, constrained by the laws of physics, and matched against the very few pieces of data we have from the past (which are all too easily misunderstood). The plasma interactions, even if they did not happen exactly as suggested here, were real, nonetheless. This model would exist entirely within the imagination, one among other cosmological postulates, if it did not lead directly to the imagery Talbott took as evidence for the Saturnian Polar Configuration, and the prior work by Santillana and von Dechend.

Talbott's Saturnian Polar Configuration was, as a matter of fact, largely ignored for some 20 years, mostly because no physical system seemed to answer the demands of the imagery. But since the involvement of Thornhill in the 90's, much has changed. Despite objections from some astrophysicists, a model held together by electric conditions works to explain Talbott's imagery. That is not to say that there have not been many other alternative models suggested.

I should also point out that Anthony Peratt's investigations of petroglyphs worldwide, the results of which were presented in technical papers in 2003 and 2007, largely substantiated the positioning of Earth in the lower coma of Saturn in the period of 10,900 BC to 8347 BC (my dates) -- substantiated, that is, by the scenario developed here, not by Peratt. The information on petroglyphs was presented by Peratt as a massive aurora, although "aurora" represented a simile with admitted discrepancies, as he has noted.

Meanwhile, the *imagery* of the polar configuration itself has remained unchallenged and the documentation has been continuously expanded with information from additional sources. In fact, this imagery worldwide stretches back in time to 6000 or 7000 BC, and ultimately into the European Upper Paleolithic of 40,000 BC.

Venus Figurines

Throughout the Upper Paleolithic and the Neolithic, from about 40,000 years ago, Saturn was seen by humans and recorded in sculptural artifacts, the so-called Venus Figurines. These were carved by the thousands during the Upper Paleolithic, and in hundreds of millions in the Neolithic. These hand-held sculptures were carved, I should point out, by the same people who decorated their spear-throwers with realistic representations of horses, deer, fish, and birds. In Western Europe these same people decorated 300 caves with images of herd animals, but not a single realistic representational painting or carving of a human -- the only exception in all this being the grossly fat or distorted Venus-Figurine sculptures.

What was seen in the skies during these 40,000 years was not just the planet Saturn, but a grouping of four (initially) planets stacked one above the other -- Uranus, Neptune, Saturn,

and Mars, from top to bottom. This stack stood "upright" in the skies, so that each of the planets traveled on a nearly identical orbit around the Sun. [\[note 7\]](#)

How did these planets become grouped together? Since all indications are that Saturn had been on an elliptical path close to the Sun for perhaps as long as ten million years, sooner or later Saturn could have swept up the other planets traveling on close orbits around the Sun. I am, in fact, suggesting that this happened over the course of the last two and a half or three million years. There are no human witnesses before that time, and even before about 34,000 years ago there were no reliable artists recording strange objects in the skies.

The other planets would be electrically attracted to Saturn as soon as their plasmaspheres touched -- because all the Solar System planets were effectively negative in relationship to the large positive charge of Saturn. This condition would soon be acted upon with a charge equalization in the form of a thunderbolt -- of which the earth shows a number of instances, among them the Grand Canyon, the Mediterranean Sea, and a series of lakes and deserts stretching across Asia.

It is not at all clear how these extra planets could remain in subpolar or suprapolar locations with Saturn, except to suggest that each formed its own protective plasmasphere, and thus became electrically isolated from Saturn. Despite the isolation, a flow of plasma (electrons) would still spread over the outer surface of the plasmasphere of the secondary planets and made its way to the planets via their magnetic poles.

As suggested in Appendix B, "Celestial Mechanics," Neptune was probably located 800,000 miles (1,300,000 km) above Saturn, and Uranus was located another million miles further above. Mars was below Saturn some distance, but I have no reasonable estimate of the distance. These separation distances can be found with good accuracy from today's orbital inclinations.

Late in 2009 I finally realized that there were two planets below Saturn and above Earth, and could identify the additional planet between Saturn and Mars as Mercury. David Talbott had held this as a condition of the polar stack, but had identified the planet between Saturn and Mars as Venus. (He has also remained unaware of the planets above Saturn.) My objection to identifying the lower in-between planet as Venus is that Venus was always depicted outside of Saturn with a plume-like connection to an equatorial or polar location. At one time Talbott had also identified Venus as circling Saturn at the edge of its ring system or beyond. I certainly agree with this. I would suggest from this, and from the extreme surface temperature of Venus, that it was created in the plasma outpouring of the nova event of 4077 BC.

Introducing Mercury into this configuration at a later date solves numerous problem conditions which would otherwise remain mysterious. I will touch on these as required in later text and later chapters. But at this point I should at least suggest that I think Mercury only became part of the stack of planets late during the Magdalenian period (17,000 to

14,000 ya).

Mars was probably located very close to Saturn initially and would have moved away by a few million miles by the time the first Venus figurines were carved (detailed below), for the feet of the figurines are located an appropriate distance below the trunk. If Mercury indeed was added to the polar configuration late, then it would need to have been inserted between Saturn and Mars.

[Image: left: Saturn with Neptune, Uranus, and Mars enclosed in plasma; right: Venus of Willendorf; Venus after a photo by Don Hitchcock. Illustration by J. Cook.]

The shaping of Saturn's electric field by its magnetic field might have been sufficient to relocate each of the planets into positions above or below Saturn's poles. Neptune traveled directly above Saturn, with its spin axis aligned with Saturn, and its south magnetic pole facing Saturn's north magnetic pole. Above this traveled Uranus, tipped up at 10 degrees from the horizontal so that its upper geographic pole (which is the magnetic south pole) was located directly above Neptune's north magnetic and geographic pole. The other pole, away from the centerline of Saturn and Neptune, tilted down 10 degrees. This downward tilt will show up in the tipped-down heads of millions of "Venus figurines" throughout the world over a period of more than 25,000 years.

The magnetic alignment had nothing to do with holding the planets in position, as might be suggested from the fact that the magnetic poles attracted, rather than repelled in this alignment. It probably has more to do with shaping the flow of plasma from planet to planet, and thus the electric fields experienced by each of them.

The planets were surrounded by a glow mode plasma, due to the attempt at charge equalization by Saturn with its surroundings. The magnetic fields shaped the coma, forcing a pinching of the glow mode plasma in the gaps between the planets.

Seen from a low angle Saturn and its three planets (at the Gravettian, 28,000 to 24,000 years

ago) would look like a fat woman. Saturn and its bulky coma constituted the belly and buttocks. The connecting coma surrounding Neptune, accentuated by toroidal belts surrounding its equator, providing the imagery for two large breasts. Although these planets rotated, the image of two bulbous breasts would remain the same, as did the view of the fat belly. The head was modeled by Uranus, which, because it rotated in the plane of the ecliptic (Uranus lies nearly on its side), did not seem to move except as a single rotation (as part of the figure) during the course of the Saturn's path around the Sun.

The Venus of Willendorf represents the archetype of Venus Figurines. Although it was found during excavation for a railroad bed, it was instantly dated to 28,000 years ago from its form. The face, typically, is covered with hair, with the head tilted forward. The hair is an outstreaming of plasma in glow mode from the north magnetic pole of Uranus. The 10-degree forward tilt of the head remains as a distinguishing feature for nearly all of the Venus-figurines for the next 25,000 years.

The legs are formed by a stream of plasma to Mars, far below Saturn, but the feet are never shown (or broken off as on the Willendorf Venus). The plasma stream to Mars may have been bifurcated, which would make the dual streams look like legs. The coma at Mars is of a much smaller dimension, not only because Mars is small compared to Saturn or the other planets, but because Mars has no magnetic field nor any exterior layer of liquid or gas, and thus could not support much of a coma.

How large was the image of the Saturn configuration in the sky? All the figurines are of a dimension which can be easily held in the palm of a hand, 3.5 inches high. Held at arm's length such a figurine can be compared to Saturn as seen in the sky. The Saturnian planets would be about 29,000,000 miles (47,000,000 km) away under the condition of comparing the hand-held figurine to a stack of planets at least 2.8 million miles high. [\[note 8\]](#)

Time line

The progress of the location of Earth with respect to Saturn can be traced through the approximate dates of various forms of the millions of figurines over time. In the diagram below I have schematically placed Earth at various locations further away and closer to the Saturnian planets, and at various levels, in order to represent the view of Saturn from Earth. An important consideration is the foreshortening which at times condenses widely spaced planets to a view where they are effectively lumped together.

[Image: Saturn depicted at various vantage points during the Upper Paleolithic and the Neolithic. The view is edge-on to the orbits. Illustration by J. Cook.]

The series of positions shown above is not the path of planet Earth. There were probably periods of thousands of years where Earth's orbit did not come anywhere near Saturn. Only the last few positions (4 to 8) were sequential, even though these were spaced over 4000 years. It is also important to realize that Saturn was only seen in the skies periodically. Only since about 9,000 BC was Saturn seen continuously. If the sight of Saturn had the constancy of the Sun, there would have been no record made at all. The shapes mentioned here are described in more detail further below.

The end-points should be obvious. In the remote past Earth saw Saturn from a considerable distance, and probably only periodically. The slow progression of changes in the relative distance between Earth and Saturn ends with Earth positioned somewhere below the rotational axis of Saturn. Intermediate positions must follow the sequence of depictions of Saturn which can be ascertained archaeologically from the shape of the figurines, and at least

approximately dated. [\[note 9\]](#)

Although the diagram above was made from archaeological considerations only, it would be of interest to compare this with concurrent glaciation and climatic conditions. Additionally, the data derived from an investigation of some 4,000,000 petroglyphs worldwide by Anthony Peratt, published in 2007, fits the archaeologically based chronology presented here. My chronology was originally derived from a website in Turkey. Overall it has held up well.

- **(1) 40,000 years ago:** The "cup and tail" marks are found inscribed on rock faces worldwide. These are impossible to date accurately, but seemed to have appeared at various times between 40,000 and 20,000 years ago.

I have personally wondered at these worldwide incised "cup and tail" marks -- the earliest and one of the simplest rock carvings. This is a nearly closed inverted "U" shape, with a line scribed out of the center into the space outside the cup. When oblong-shaped rather than circular, these are often called "vulva" marks. Why would people, on every continent, carve the same figure on rock walls and horizontal rocks, and in such great profusion?

The ubiquitous cup and tail carvings predate any other depictions of remote antiquity and are found absolutely everywhere throughout the world. These point to an earlier time long before the Earth was captured by Saturn. The marks look like a distant planet in arc mode plasma discharge to a small planet below its south pole.

This most likely was Saturn in plasma contact with Mars below, as it certainly was at a later date. I am suggesting this because most of what I have seen of the cup and tail marks have the tail pointing straight down or at a small angle, but never directed up or horizontal. If the tail had represented a cometary-like plasma tail, it would have faced away from the Sun, and been seen sideways in the sky.

As seen and depicted, the imagery would define the mark as coming out of the cup. Thus we are looking at a far distant view of a plasma (coma) surrounding Saturn with a brilliant "tail" extending to Mars below. The same arc mode extension to Mars would especially be noticed against the dark night sky, of course. [\[note 10\]](#)

- **(2) 28,000 to 24,000 years ago:** This is the era of the classical Venus Figurines of the Gravettian period of the Western European Upper Paleolithic: a Fat Lady, footless and faceless. For some six to ten thousand years following this period, these disappear from Western Europe. The painted caves of Southwestern Europe, by the way, date from 32,000 years ago. The initiation of new caves never let up during all of the time from 32,000 ya through about 10,000 ya. [\[note 11\]](#)

The Cro-Magnon first show up in Europe 35,000 ya in Carbon-14 dates, which is 45,000 ya in calendar years (Romania). The finds at Cro-Magnon in France were dated (Carbon-14) to 28,000 ya. It is these people who have provided the first records of what the Fat Lady in the

sky looked like (and who decorated the limestone caves). It is followed shortly (more or less) with the start of the last significant glaciation, from 27,500 ya to about 14,500 ya. This suggests that Earth might have been carried along by Saturn for an extended period of time. Possibly during a very long portion of this Saturn simply could not be seen because of an enclosing coma which also enveloped Earth.

The images of women simultaneously steatopygic and pregnant, or at least with body parts which jut out horizontally below the belly or trunk, suggests one or two planets off center below Saturn. As I suggested earlier, the rotational axis of the Earth probably never lined up with the rotational axis of Saturn, even though the interaction of the two planets lasted thousands of years. This would be true for other planets also.

What is seen in some of these images (but obviously not all of them), I suspect, is a planet which had recently been captured into a subpolar orbit and which would not assume a symmetrical location with respect to Saturn for thousands of years. I would assume that this was Mercury. I would also suggest that at this time Mercury would likely still have had a substantial atmosphere, and thus be capable of sustaining a coma. [\[note 12\]](#)

[Image: Three figurines from the Western European Gravettian culture, 27,000 to 24,000 ya. In buff or amber limestone; left to right: 3.5", 3.25", and 1.75" high. After Denis Vialou, Prehistoric Art and Civilization (1996)]

- **(3) 17,000 to 14,000 years ago:** The figurines reappear in the Magdalenian period. They are elongated and distorted, although they still basically look female. To achieve this look, Earth had to be in an orbit such as to bring it nearly level with the Saturnian stack, thus showing the true separation between the planets.

After 14,000 ya (12,000 BC) the glaciers retreated, although they did not disappear. Earth did get considerably warmer. Then in 10,900 BC Saturn passed Earth at a position somewhat below its equatorial level, and Earth received a tremendous electric field shock which destroyed most of North America. North America burned down and the large grazing animals

disappeared worldwide. This started the 1500-year extreme cold and shadow period of the Younger Dryas, lasting to about 9,000 BC. During this period Earth ended up located somewhere below Saturn. Because of the shadowing cover of dust in the stratosphere, it would not be until well after 9000 BC before Saturn would reappear, and then Saturn was mostly obscured by its coma.

The figurines of the period after 10,900 BC are likely to be representations of what was seen in the far south. What we have in this period from many sources is a god with the head of a fish, or a head with the body of a snake. The descriptions are found everywhere in the world among the earliest mythologies -- China, the Eastern Mediterranean, Greece, Western Europe, and South America. These are the ball plasmoids described in the previous chapter.

"The 'Acropolis of Athens' was in ancient times known as the Cecropia, in honour of the legendary serpent-man, Cecrops, the founder and first Athenian king. Cecrops means 'face with a tail', and though often said to have the bottom half of a serpent, some sources say it was a fish-tail -- thus bearing some resemblance to Oannes of Babylonian fame." -- Philip Coppens

For locations below the equator, where the Absu did not obscure the ball plasmoids, this became a smiling face surrounded with sun-like rays or snake hair.

- **(4) after 9,000 BC:** After about 9,000 BC, as Earth started to move more directly below the center of Saturn, the imagery depicting a Fat Lady in the sky again becomes important, with the number of sculptures increasing.

By about 9000 BC the carbon material had cleared out of the Earth's stratosphere. The result was that Earth became the sources of electrons for Saturn and Saturn may have been more clearly seen. Now it appeared in the north skies all the time, although likely enshrouded by plasma in glow mode.

After circa 6,700 BC squat figurines appear, for now the Earth has moved to a location directly below Saturn. In Catal Hoyuk, in Anatolia, male figurines were created at earlier times, but after 6,700 BC no further male figurines are formed. All the figurines are equipped with breasts. Because of the lower perspective on the Saturnian planets, the figurines become fat and seated. The legs are lost as the coma tail extending to Mars disappears at times against the main coma of Saturn.

At this period in time the glaciers are gone, having melted a thousand years ago, by 8,000 BC. From 7,500 BC the climate in Europe warms because of the relationship of the northern hemisphere to the Sun.

- **(5) after circa 5,600 BC:** Even the perspective of a seated woman is almost entirely lost, and the figurines start to become entirely abstract over the next 1500 years. Earth was within the lower coma of Saturn at this time.

There are many abstract forms found which can reasonably be dated to this period. They look like snow men, or have headless body shapes with long necks. Possibly these represent the southern plasmoid of the "Peratt Column" rather than Saturn in the north, although we could be viewing these as inverted.

The shape in the north would not be seen clearly when the layers of plasma in glow mode obscured the view. At this point we have recollected descriptions, but no figurines.

- **(6) after circa 5,200 BC:** What is now experienced is only a white cloud in the north skies, endlessly revolving about the Earth's polar axis. There are recollections of a tail extending to Earth from the cloud. But, again, most descriptions are as likely to be of the earlier southern ball plasmoids instead. Nothing of interest was happening in the north. The tail of these hurricane-like forms extending from the south is the "Peratt Column."

Cardona notes that this apparition was known as "Hurricane" in Central America and the Caribbean. But the *Popol Vuh* makes it clear that "Hurricane" is one of the three Gods comprising "Heart of Earth, Heart of Sky" in the south, where the other two are called "Newborn Thunderbolt" and "Sudden Thunderbolt." "Hurricane" is actually known as "Thunderbolt Hurricane."

"Thunderbolt Hurricane comes first, the second is Newborn Thunderbolt, and the third is Sudden Thunderbolt. So there were three of them, as Heart of Sky."

-- *Popol Vuh*

- **(7) after circa 5,000 BC:** In the north a giant circular shape shimmers through the mist, or through the plasma streaming to Earth (or past Earth). Some people see this as a duck, other see the shape of an egg. This is the coma directly surrounding Saturn, or Saturn and Uranus. It is likely that the white and smaller shape of Mercury represented the egg, set against the lower edges of Saturn.

The bird shape (duck or goose) derives from the fact that Uranus was offset from the rotational axis of Saturn but connected with a long stream of plasma to its south magnetic pole (which is the north geographic pole of Uranus). Seen from below, as the Earth approached a position below Saturn, Uranus would have been seen on the right upper side of Saturn. The connecting neck of plasma is attached to a round head, slightly broader, with a beak-like protrusion at the other pole of Uranus. I am basing this primarily on the early iconography of the Eastern Mediterranean, as presented by Marija Gimbutas (detailed further below).

Seeing a bird form in the north proved that the giant bird, which had been seen spiraling to the north over the last four or five thousand years (or perhaps for a longer period), was now stationed above the north polar region. More on this particular topic in a later chapter.

- **(8) In 4077 BC:** The bird of creation has laid an egg, smaller than the surrounding coma, and initially white, but this turns to yellow or gold as the egg "breaks open" - a nova event for Saturn.

I suggested above that Mercury with its coma might have been understood as the egg. But when Saturn went nova, it was as if the egg appeared out of the large shape of the duck or goose body. When Saturn went to arc mode discharge in 4077 BC, all of its glow mode and the surrounding coma collapsed. Only the much smaller golden sphere remained in the north sky.

In the north, Mercury (with a coma supported by its atmosphere) and Mars below Mercury appeared clearly, although Mars would have appeared only as a small dot against Mercury or Saturn, and frequently offset from the axis of Saturn and Earth. Uranus appeared to one side, disconnected from Saturn except for a remaining plume of plasma -- originally its neck, but now its hair. [\[note 13\]](#)

Changes

A warmer climate is noted in archaeological records worldwide after 4077 BC, over and above the warming after 9,000 BC, the Hypsithermal.

"Radio-carbon dating and analysis of pollen in buried soils, has shown that the environment of lowland Britain changed around 4,250-4,000 BC. The change to a grassland environment from damp, heavy soils and expanses of dense forest was mostly brought about by farmers, probably through the use of slash and burn techniques, although environmental factors may also have made a contribution." (Wikipedia)

The same change is noted elsewhere, as, for example, in the archaeology of North America. It is an indication of a completely new era in the history of the Earth and its humans, known as "The Era of the Gods."

As I noted above, only after 9000 BC, at the end of the obscuring dust in the stratosphere, did the figurines again proliferate, eventually reaching into the millions on millions worldwide. Below, I will start with the collection of Neolithic imagery of the Northeastern Mediterranean region gathered by Marija Gimbutas for the period of 7,000 to 3500 BC, and then this discussion will move backwards in time: Over the next two chapters I will start with a suggestion of imagery of the Lower or Middle Paleolithic (500,000 to 2,500,000 years ago). Then to cover the European Upper Paleolithic (10,000 to 40,000 years ago) to discuss cave art and early figurines in Europe, followed by the narrow transitional period represented by Catal Hoyuk in Anatolia in 7400 to 6200 BC.

Neolithic Figurines

Of great importance in the field of artifacts and dateable archaeology in the Neolithic is the voluminous collation of archaeological findings collected and interpreted by Marija Gimbutas for the Balkans, Macedonia, Minoan Crete, and Anatolia. The dates of her studies range from 7000 BC to 3500 BC. [\[note 14\]](#)

I cannot adequately summarize Gimbutas's research here. Gimbutas presents pottery which shows motifs of eggs, dual eggs, snakes, water signs, birds, the double axe, and whorls. The last two are similar to the designs of the megalithic art of far-western region of Europe at the later dates of 3000 to 2400 BC. Animals are also depicted with the pottery decorations -- the domestic animals of Europe rather than the Mesopotamian and Egyptian lions and griffins. [\[note 15\]](#)

Of special interest are the numerous figurines described by Gimbutas. Almost every one of the 100,000 small hand-held figurines of the period 7000 to 3500 BC is female, naked, and obese (or pregnant), especially among the earlier examples. Only in infrequent instances do faces appear incised on the figures, or are there hints of ornaments or clothing. In later forms they are often shown with outstretched arms (and legs), long phallic necks, and heads with "bird masks." They are shown at times giving birth or with children.

Gimbutas points out the obvious -- that the Venus Figurines were not new to the farmers of the European Neolithic (7000 to 3600 BC), but carried on the tradition of the 3000 or so female figurines of the Upper Paleolithic (40,000 to 10,000 BC) of Europe. Figurines have been found by the hundreds of thousands throughout Europe, and in the Neolithic expand to millions on millions throughout the world. The figurines were first produced in about 27,000 BC. They disappear from the archaeological record of Western Europe for some 10,000 years, and reappear again after 18,000 BC, long before the appearance of the related artifacts in Gimbutas's collection. [\[note 16\]](#)

The images are understood by Gimbutas as representing the Mother Goddess. However, they are congruent with the later "Polar Configuration" imagery depicted in the Middle East and Egypt.

I think the Venus Figurines of the Upper Paleolithic, consistently naked, fat, female, faceless, and footless, and later similar naked female figurines of the Neolithic, describe Saturn in glow level plasma discharging to a set of planets -- two above and two below the poles of Saturn. A plasma discharge in glow mode will form a bubble much larger than the object that is discharging, and will look like a physical connection between close planets, which consists, however, only of an enclosing bubble of charged particles for each planet, with a pinched condition in the region between the planets.

The head with the missing face, often shown with what looks like braided hair covering the face, is a glow level plasma discharge from Uranus located above Neptune, but offset so that the head looks to be nodding forward. This is a consistent feature of the figurines.

In the later period of the Magdalenian the planets above Saturn seems to have moved further apart, elongating the necks of the figurines. This change in how the figurines looked is likely due to a change in perspective. At some time Earth passed through a position at an equatorial elevation to Saturn.

The "bird mask" faces of Gimbutas are likely the plasma discharge to Saturn, via Neptune, which started at a location about 10 degrees above the horizontal (not at the bottom) of Uranus directly above Neptune, with a much lesser secondary flow from the opposite horizontal location of Uranus, thus forming the bird beak of the long-necked figurines.

Today the magnetic pole of Uranus is located nearly perpendicular to the plane of the ecliptic, and thus perpendicular to the axis of rotation. This is an enigma for astrophysicists, who maintain that the magnetism of a planet is internally induced by a differential rotation of the core material. Plasma theorists maintain that the magnetic fields of planets are externally induced by the electric field of the Sun. I see no reason for the magnetic poles of Uranus not to have been aligned closer to the axis of rotation during the time it was within the sphere of influence -- the electric field -- of Saturn.

Uranus today still lies on its side with its poles placed 10 degrees above and below the horizontal (above and below the plane of the ecliptic). The plasma flow to Saturn would start mainly at the south magnetic pole of Uranus, which was the pole closest to the rotational axis of Saturn and Neptune, and is today identified as the north geographic pole of Uranus -- angled 10 degrees above the horizontal. Thus the main flow of plasma, the "neck," would connect to a "head" which was tilted downward by 10 degrees and pointed away from the "body" of the coma of the other planets.

Since Uranus lies on its side and its axis of rotation points along the plane of the ecliptic, the "head" of the figure in the sky would seem to rotate only very slowly, once with each rotation of the Saturnian planets around the Sun. It was as if she was standing still in the sky.

Along with the bird mask face another peculiar feature of the figurines worldwide is the slit eyes which almost all of them have, even at locations thousands of miles (or continents) apart, and which carry through enormous spans of time. It is inconceivable that this feature, which spans all the continents and tens of thousands of years, would be a worldwide graphic convention.

The first clear instance of slit eyes actually dates to the Upper Paleolithic, a figurine excavated in Moravia at Dolni Vestonice (Dolní Věstonice) dated to 30,000 to 24,000 ya. Slit eyes are still being added after 3000 BC, and represented by the millions upon millions of figurines.

It is likely that one or more of the satellites of Uranus, which would revolve around Uranus in a circle at almost a right angle to the horizontal, managed to extend beyond the enclosing plasma coma. The four outer satellites of Uranus are large, and rotate at periods of a few

(Earth) days to thirteen days.

The outer and largest satellite, Oberon, orbits at 600,000 km from Uranus, far outside of the rings. At a rotational period of 13 days, Oberon would be visible for about three days in any quadrant of its rotation. This still does not constitute a "slit," nor would it represent two eyes. The slit might be a trailing plasma of Oberon, perhaps shadowed by the Sun, as Oberon and its tail broke through the enclosing coma at one quadrant. We can assume a bilateral symmetry for the coma, so that if this happened in one quadrant, it would be repeated at an adjacent quadrant (seen at the upper left of the face, then seen at the upper right quadrant). The "front" of the "face" of Uranus could only be viewed for a few weeks during the Earth's solar year, so that the existence of two eyes might have to be an assumption made by humans on the basis of profile viewing of the planet. The partial visibility of Oberon has implications for the size of the coma surrounding Uranus.

The legs with the missing feet describe a plasma stream reaching to Mars far below the south pole of Saturn. The large belly or buttocks is probably the coma surrounding the planet Saturn. The large breasts are the left and right extremes of a similar plasma toroid surrounding Saturn or (more likely) Neptune.

All four or five planets together would always be seen as a standing figure in the ecliptic of the sky, and, in effect, standing still because the beak of Uranus always pointed in the same direction of space. The ecliptic would wobble throughout the year and daily (as today), and the figure would seem to move up and down in the sky over the course of a year. Except when near the horizon, where the ecliptic dips below the equatorial seasonally, the figure would always be nearly upright -- like the "face" in the Moon today.

The power of seeing an image of a woman in the sky during the Paleolithic and early Neolithic, seen periodically rather than continuously, must have made an enormous impression. Humans anthropomorphized what they saw. Humans saw the Fat Lady approach and move through the night sky -- perhaps to deliver babies -- then disappear and return again in a year, or, at an earlier time, in decades, or a thousand years. The bird figure of the Neolithic, with the rounded body and the long neck and single leg, remains in European iconography as the stork which delivers babies.

During the early Neolithic, this image was seen more frequently, although probably still unpredictably. If it had been seen all the time, or with predictable movement, it would have had no more psychological impact than the ever-present Sun and Moon, neither of which have ever generated much in imagery or myth. The Sun is stable, and the Moon moves regularly. But Saturn as a figure in the sky would move unpredictably. The figure might have moved from the daylight skies to the night skies over the course of the year (or some inexplicable period) and certainly would move further up or down in the sky with the change in the respective orbital locations of Earth and Saturn.

The persistence of the imagery into the early Neolithic (when the location of the figure had

more or less stabilized) and the subsequent proliferation of reproductions may be due to the culture specific to the first Neolithic farming communities. If the early farming and gathering communities were run by woman (as seems likely), the Fat Lady might have been their emblem and symbol. [\[note 17\]](#)

After 10,900 BC, with the onset of the Younger Dryas, there was nothing to be seen in the skies because of the shadow of that era.

When the skies cleared considerably in about 9,000 BC, there again was little to see except endless swirling skies. Then, after about 5800 BC, the Earth had fallen into an orbit below Saturn and seemed to have moved closer. This in effect obliterated the figure in the sky, replacing it by a swirling cloud, which eventually transformed into a giant white bird (and later an egg) rotating above the horizon in the north. Because Uranus did not line up with Saturn, it was seen past the edge of Saturn as the head of a bird, and the whole was recalled in the artifacts and pottery decorations of some people as the image of the Goose of Creation.

What is amazing is that in Eastern Europe and Anatolia, the figurines shifted effortlessly from the naked fat woman to a bird-masked figure (as it did in Japan), despite a definitive lack of anything of form in the skies for a period of a few thousand years. It is possible that between 10,900 BC and 8347 BC the southern ball plasmoids substituted for the Fat Lady (resulting in a spate of snowman figurines). And if today we possess 100,000 recovered figurines for a portion of the Eastern Mediterranean, then there were likely millions more originally. That would constitute a social force, like a religion, which determines its own continuity.

In 4077 BC Saturn went to arc mode discharge to Earth and the imagery in the sky changed. Saturn went nova -- that is, it underwent a mass expulsion (creating Venus and possibly the rings), and switched to arc mode plasma discharge. The Earth now became the main contact point for the plasma discharge, via Mercury and Mars. Earth was a newcomer to the group, and a fresh object to steal electrons from. [\[note 18\]](#)

There now appeared a whole new set of images in the sky, but many of the figurines and related artifacts, while still replicating the earlier iconography, are now embellished differently. The figurines have added outstretched arms, perhaps representing a depiction of the rings of Saturn. Conservative as humans are, the new images only reinforce old established interpretations. The persistence of Goddesses (as opposed to Gods) lasted well into the Classical era (thus lasting some 6000 years to the start of our era), even when nothing in the sky looked at all like the Fat Lady anymore. The idea of a Goddess as the generatrix of humanity is expressed by the priests of Sais who talked to Solon -- as reported by Plato.

Actually, the figurines stopped development after about 4000 BC. (There were some worldwide exceptions.) They either became reductively abstract or realistically humanized. By 3000 BC production of the figurines had stopped almost everywhere in the world, except

in a few locations where they take on the status of amulets. Crete was still manufacturing the figurines wholesale in 1500 BC, as tourist souvenirs -- acceptably slimmed down and painted.

Objections to Gimbutas

Gimbutas traced the Earth Goddess imagery forward to the Goddesses of Classical Greece: Hekate, Artemis, Demeter, and the warrior Goddess Athena. The multiplicity of Goddesses in Classical times and the variation of local names suggest that the prototype Goddess existed since very early times. Despite the variety of names, the rituals and mystical associations remained constant over large geographical areas.

The earlier status of the Goddesses was not easily lost. Goddesses remained in the pantheon of early antiquity and in some cases retained their primacy. Athens claimed the warrior Goddess Athena as its own. Isis remains the most popular Goddess of Egypt, and her worship and veneration carries over into Roman times. (The imagery reached India and eventually China.) The succession of the Egyptian pharaohs continued to be matriarchal. However, many of the goddesses who might have been the supreme deities of earlier times are found to be married to male gods by classical times (as Gimbutas notes).

The advent of male gods, says Gimbutas, happens following the invasions of the Kurgan "Indo-Europeans" from West Central Asia after 4300 BC. This was a male-dominated nomad society, based on herding. These Indo-European invaders did not displace the original Europeans, but they brought many changes -- warfare, the feudal system, male domination, male deities, and probably new languages. The second or third wave of invaders apparently brought the horse. With nothing to trade, the later Kurgans herders developed an economy of piracy and raiding. [\[note 19\]](#)

Many critics have seen Gimbutas's theories as an affront to their closely held views of prehistory and the primacy of males, especially her suggestion that a peaceful matriarchy was displaced by a war-like Kurgan overlord patriarchy. The implication of Gimbutas's work was that the sculptures, figurines, model temples, and pottery decoration were the exclusive domain of women, and further, that the small farming communities were run by women.

I doubt if we can conclude that a matriarchy existed on just this basis, even with the many remnants of matriarchy still extant today. Any mix could have been possible. We are seeing remnants of emblems, not the underlying philosophy or practices of a culture. Our Western Christian culture is based on a sacrificed God, yet little could be made of our icons and emblems if viewed in the archaeological context of a far-distant future if these icons were the only evidence of our culture. [\[note 20\]](#)

My disagreement with Gimbutas centers on her insistence in seeing nearly everything as symbolic, "... prehistoric art was symbolic art." I insist that prehistoric art was

representational art. "Breasts symbolize the nurturing and regeneration of life." Breasts were shown because that is how the model for the figurines was seen in the sky. To her credit, but perhaps to bolster her thesis, Gimbutas also insists that the naked figurines were not meant as erotic depictions. Art historians have pointed out that there are no erotic images to be found anywhere in the world until well into the first millennium BC.

If Gimbutas's "cult of the Goddess" was generated by images in the sky then it was not a reflection of life, but a response to a whole other domain -- which today we blithely identify as "spiritual" -- although in fact it was not a manifestation of the "spiritual" but a response to the "actual." And we have no idea what the response was. We simply do not know if the object or person in the sky was thought to need placation or worship.

Endnotes

Note 1 --

About the Holocene climatic optimum, Wikipedia reads, "While temperatures in the Northern Hemisphere were warmer than average during the summers, the tropics and areas of the Southern Hemisphere were colder than average."

Today the Earth is 5 million miles (8 million km) closer to the Sun during winter in the northern hemisphere than in the summer, but that has little to do with the climate, although distance from the Sun is a factor.

The seasons of the Earth are determined primarily by the inclination of the spin axis. During the Hypsithermal period, with the Earth below the Sun year round, there would be relatively little change in the angle of the Sun in the sky. Thus summer lasted year round.

As Earth started to draw closer to Saturn after about 6000 or 5000 BC, the climatic zones relocated to their proper place on the globe. The Nile filled with water again, and the Nile valley was occupied again.

The continuation of the mild climate after 3147 BC was primarily due to an orbit which was much closer to the Sun than today. The further extension of a milder climate to 2500 BC (others claim 2000 BC or even 500 BC) may have ended with the advent of the darkness of 2193 BC -- a 200-year shadow condition like the shadow of the Younger Dryas period.

Note 2 --

See Charles Ginenthal, "The Extinction of the Mammoth" (*The Velikovskian*, V3, No 2 and 3, 1997, available as a reprint), which lists a compendium of sources on the effect of the

Hypsithermal in the subarctic regions. Ginenthal, however, is out to prove the extermination of the mammoth in Siberia in conformity to Velikovsky's claim that this happened, and happened only once, in 1500 BC. The evidence is thus selective, and in places Ginenthal is more interested in disproving established data, as, for example, in bringing in evidence of discrepancies in Carbon-14 dates.

Ginenthal writes about glacial till deposited in the North Atlantic, called Heinrich layers, which have been identified as debris of land glaciers as they skidded into the ocean. The Heinrich layers represent melting conditions for land glaciers. Ginenthal asks: "... why are there no such layers [of deposited continental debris] in the oceans in the southern hemisphere closer to Antarctica?"

He answered his question with, "The ancient ice cap in Antarctica did not exist at this time." That is one answer, but, in fact, the Antarctic glacier most likely existed. There is no evidence that the Antarctic glacier ever melted (in the last 120,000 years). The South Pole was in almost total darkness during the early Hypsithermal, and thus we should not expect glacial melting. And the South Pole is very mountainous, a geology which always retains glaciers. The most recent Heinrich layer in the North Atlantic (named "H0") dates from about 12,000 ya, well before the start of the Hypsithermal.

The mammoth, and other large grazers, including dozens of species of elephants, rhinoceros, giant beaver, and billions of trees were destroyed in 3147 BC, when high tides (probably from the south initially) swept inland and rolled broken carcasses and splintered trees to the Arctic ocean basin. The mammoth herds re-established themselves over the next two thousand years, as did the plants, for the climate had not degraded all that much. There was a considerable change in climate circa 2200 BC, however, when the Hypsithermal ended and the effect of the long Arctic night was felt again. This may very well have been the effect of the interaction with Venus in 2193 BC, when the skies darkened due to dust in the stratosphere (it ended the Akkadian Empire and the Egyptian Old Kingdom also). But the final change in the climate of Siberia -- a return of frozen ground and a cover of Tundra -- probably happened in 1492 BC, when the mammoth herds were subjected to a catastrophic winter condition, lasting more than a year as the Earth nearly tipped over. Directly after, the Earth's orbit became some 30 percent larger, a value close to what we experience today.

[\[return to text\]](#)

Note 3 --

I estimated 10 to 15 degrees from climate data. Ginenthal estimates 13 degrees, also based on climatological considerations. He presents this in terms of the rotational axis of Earth being inclined only 9 or 10 degrees to the orbital plane of Earth, rather than the 23.5 degrees experienced today. The two estimates are equivalent except that, under my proposal, the Arctic land region would have long summers and experience less of the dark Arctic winter. Under Ginenthal's proposal the South Pole would also have been lit by the Sun. Under my proposal the Antarctic region would remain completely in the dark for 3000 years. But of

southern land regions, even the tip of South America, which is at 50 degrees south latitude, would not experience continuous darkness.

[\[return to text\]](#)

Note 4 --

The period is also known as the Holocene wet phase, which allowed reoccupation of the desert area west of the Nile valley (and south of the Mediterranean) after 9000 BC, a region where no one had earlier lived for a thousand years. The Nile valley itself was unoccupied from about 9000 BC to 6000 BC. It has been suggested that the Nile was reduced to a trickle during this time, the result of less rain falling in Central Africa and Ethiopia. The Nile normally fills a very deep and narrow gorge, apparently created 5 million years earlier, when the Mediterranean had dried up.

Note 5 --

The book "North American Indian Stone Bird Effigy; Field Guide, Finding and Identifying" (2010), by Dennis Moore, presents a collection of Paleoindian artifacts of a central region of the state of Michigan. This area was occupied by hunters (presumably using the Clovis spearpoints) after the Laurentide Ice Sheet melted in this location in about 13,000 to 12,000 BC. But then in 10,900 BC the electric field impact force centered on Hudson Bay brought all life to a halt.

Reoccupation took a thousand years and was by a different people. The stone artifacts found at this location represent a snapshot of the last few thousand years of a chipped-tool (Mousterian) tradition. The sitting stone bird forms are found above the sand fill deposited after 10,900 BC in Michigan, and thus likely date to after 9000 BC, that is, after reoccupation of the region when the cold snap of the Younger Dryas had ended.

Moore's collection of stone bird effigies are crude and unfinished except for hammering and chipping, and the scoring of lines. This is unlike the "birdstone" Neolithic artifacts of later dates which are found south of the Great Lakes and along the east coast, which are shaped by a neolithic grinding process.

The scored lines drop down from the eye of the birds. It most likely is the plasma trail of Oberon, one of the satellites of Uranus as it broke through the coma weekly. Slit-shaped eyes are ubiquitous among the Venus figurines also, often making them look like they have the faces of snakes.

Note 6 --

*[Image: Distances between the orbits of Jupiter and Earth in circa 10,000 ya.
Illustration by J. Cook.]*

The distance between the orbit of Earth and the orbit of Jupiter when Jupiter was outside the orbit of Earth is from information developed in Appendix B, "Celestial Mechanics," and based on an average orbit of Earth of 225 days (at 0.72 AU) and an estimated eccentricity of 0.25.

With Jupiter at 0.7 AU from the Sun, the Earth (with Saturn) would be at 0.54 AU at its closest distance to the Sun. The difference is 0.16 AU. The angle subtended by Jupiter, as seen from Earth, can be found from the arctangent and is 0.34 degrees, a little smaller than the angle subtended by the Moon: **$\arctangent(88700/ (.16 * AU)) = .34 \text{ degrees}$**

Note 7 --

I apologize to the reader for presenting conclusions (such as the planets in the Saturnian stack) long before all the details on which these are based can be presented and especially the details which will establish them as certain. But bear with me, all the data will be presented over the next 34 chapters and 15 appendixes.

[\[return to text\]](#)

Note 8 --

The ratio is from similar triangles, as follows: A distance of 3 feet (1 meter) for holding a 3.5 inch (9 cm) high figurine; the actual distance to Saturn to the actual height of Saturn, where I am assuming the two planets above Saturn occupied 1.8 million miles (2.9 million km) as detailed in Appendix B, and I am allowing another million miles from Saturn to Mars: **$(\text{distance to Saturn}) / (3 * 12 ") = (2.8 \text{ million miles}) / (3.5 ")$**

Distance to Saturn = $(3 * 12 * 2.8)/(3.5)$

Distance to Saturn = 28.8 million miles

[\[return to text\]](#)

Note 9 --

Book 11 of the Maya *Chilam Balam* details seven sightings of Saturn, which must have been separated by spans of time of 3000 to 8000 years. The recap of the original book, written in the 16th century AD, complains of the vast in-between periods where nothing happened. One translator (from the Mayan) suggests that the seven "stones" are described as "on fire."

Corresponding to similar periodic peaks in the changes of the levels of background Carbon-14, this would take the Mesoamerican record back to either 38,000 or 41,000 before the present. A record like this is not as radical as it looks, for the decoration of European limestone caves similarly dates back almost that long, and continued with the same aesthetic for some 20,000 years, until Southern Europe turned to a desert, and the Cro-Magnon population moved away.

I should point out that any tribal people who kept records of events would, after some thousands of years, recognize the repeating nature of the events. These would certainly stand out from all other mundane and contemporaneous events, and it is likely that only these were retained. There was little else to record or talk about for thousands of years. In that Mesoamerica and the prior people where not invested in kings or heroes but remained an egalitarian society, they did not take notice or record kings or heroes. Book 11 interprets the oldest records only in terms of the eventual birth of a Christian "God the Father" from the stones in the sky. This long period is equivalent to the seven days of creation of the Bible.

[\[return to text\]](#)

Note 10 --

The tail is thus an electric arc from Saturn which struck the northern hemisphere of Mars, lasting from before an estimated 30,000 years ago. The arc must have been absolutely gigantic, for it completely etched away the northern hemisphere of Mars to a depth of three miles (5 km), leaving only a smooth surface. (The Grand Canyon of the Colorado is one mile deep.)

It is quite possible, however, that this region was occupied by an ocean -- signs of which have been detected. If there had ever been any life on Mars it would have been completely obliterated during the 30,000 years of the electric arc (described by humans, as I'll detail later), a condition which may, in fact, have extended much further back in time. Boiling off an ocean would have caused gigantic billows of steam. As these likely condensed to rains everywhere else on Mars away from the northern hemisphere, there should be evidence of torrential floods and water damage. Except as this evidence is confused with the much later damage from electric arcing, this is indeed the case.

The cup and tail marks (some of which appear in European caves dating to 32,000 years ago) should not be confused with the concentric circles (often also with a tail emanating from the center) and swirls found inscribed on megalithic constructions after 3100 BC. The concentric circles are a phenomenon of burning gases entering the stratosphere or upper atmosphere of Earth. These have been identified from rocket launches in the 1960s. More details on this later.

[\[return to text\]](#)

Note 11 --

The archaeological record of Eastern Europe (at Dolni Vestonice in the Czech Republic) looks as if there were a continuity of figurines through the 10,000 year hiatus of Western Europe, although many of the archaeological dates, determined early in the 20th century, and without the aid of Carbon-14 methods, may not be all that accurate.

The chart "Fraction of Global Radiocarbon" which covers the period of 50,000 ya to today, was presented in an earlier chapter (Chart due to A.H.L. Voelker et alii, 1998, and presented by Firestone and Topping in 1991). I pointed up three peaks of excess levels in Carbon-14 (above the current value) as possible contacts with Saturn, especially since the Earth's magnetic pole changed location, either turning upside down or "wandering" about. In two instances these dates were also related to massive extinctions of megafauna.

On the chart below some 7 or 8 peaks can be counted. These have been numbered in correspondence to the seven attempts, listed in Book 11 of the Maya *Chilam Balam*, to have God the Father be born from the rocks in the sky -- which were periodically seen (the 8th attempt is not counted as completed in antiquity, and not numbered by me).

[Image: Fractional global radio-carbon since 50,000 bp. After Firestone; from A.H.L. Voelker (1998).]

If we can suggest that the peaks in Carbon-14 levels represent electric field contacts with Saturn (or close sightings), then it is clear that there is a period of approximately 8,000 years where nothing was seen of Saturn and Mars. This 8,000-year period, from circa 24,000 ya to circa 17,000 ya (5 to 6), coincides with the period of the absence of Venus Figurines. See Chapter 31 for estimates of intervals.

[\[return to text\]](#)

Note 12 --

The Maya *Popol Vuh* identifies five planets in the north during this time, calling one of them "Sovereign Plumed Serpent" which will be recognized as the Mayan name for Venus -- which it is not. At the time of the narrative, the era before our creation (4077 BC), Venus did not exist yet. Shrouded in a white coma, Mercury could have easily passed for the later Venus.

[\[return to text\]](#)

Note 13 --

That there were two smaller planets below Saturn may have been remembered and indicated with the construction of the gigantic Avebury henge in England (1400 feet, 450 meters, in diameter). There are two smaller circles inside the henge.

[Image: Avebury henge, artist reconstruction looking northwest, after drawings by William Stukeley (circa AD 1720). After Alan Sorell.]

The two smaller circles are offset about 10 or 20 degrees from the north cardinal direction (NNW and SSE), as is the entrance of the larger circle at the SSE edge. With the exception of Stonehenge and nearby Durrington Walls, no other henge (that I have been able to ascertain) has these details. Stonehenge has two small mounds in approximately the same locations, but closer to the edge of the original circle of 56 holes. Stonehenge was thus likely modeled after the somewhat earlier Avebury henge. The structures within the henge area of Durrington Walls are less defined, but the locations are approximately the same.

If these two circles represent two planets below Saturn, then one of them is much too large, for Mars is not likely to have supported a large coma, on the order of 10 or 20 planet diameters, although Mercury, because it likely had an atmosphere, probably would have. The fact that these "planets" are offset from each other is not a conceptual problem if Mercury indeed was a late addition to the stack of planets.

Additionally, if the henge was modeled after the looks of Mars descending during the later period when Saturn still stood at the north horizon, Mars might have been enclosed in a plasma connection in glow mode which reached to Earth, and thus would have looked much larger, especially on a close approach to Earth. This assumes that the iconography of the Egyptian White Crown is a nearly accurate depiction of what was seen in the sky. The White Crown is discussed in a later chapter.

The two circles could be dismissed as some symbolism which is obscured to us, except for the fact that the causeway leading out toward the southeast and the additional henge of the Sanctuary at its terminal are accurate. The causeway out to the southwest to the vicinity of two long barrows, is a poor memory of the conditions before 8347 BC, however. These last are models of the earlier "burial mounds" in the south sky, and apparently predate (circa 3600 BC) Avebury henge. Whoever constructed Avebury backfilled the burial mounds and blocked their entrance (in circa 2200 BC).

Ron Wilcox, at www.archtext.co.uk/onlinetexts/britains_past, suggests that the use of West Kennet barrow ended in 3625 BC. The dates of construction for Avebury are as yet uncertain. Archaeologically it is held to be constructed only very late, 2,900 to 2,600 BC, but other dates place the earliest carbon traces of the ditches (which are cut into a chalk base) at 3,400 BC. The Avebury form and the related causeways, including the one to West Kennet mound suggest it is either very old, or recalls much older forms.

Note 14 --

See Marija Gimbutas, *The Civilization of the Goddess, European Neolithic Communities, 7000 to 3500 BC* (1991), and a number of other books through 1999. Since Gimbutas read a dozen European languages, she was able to muster resources which remained unavailable to other researchers.

[\[return to text\]](#)

Note 15 --

Along with seeing an upturned crescent on Jupiter after about 9000 BC, when Jupiter was inside the orbit of Earth and with Earth below the "ecliptic path" of the planets Jupiter and Saturn, Jupiter would have been seen as a brightly lit disk, similar to the full Moon when the orbit of Earth would place it inside the orbit of Jupiter. Because of Earth's lower position with respect to the Sun (3 million miles, 5 million km), the lighted half of Jupiter would have looked like an oval (an egg shape) rather than a circle, since a portion of the upper and lower part of the lighted hemisphere of Jupiter would not be seen.

Jupiter was at that time on an orbit somewhat less than Earth's current orbit. Saturn and Earth were most likely on an elliptical orbit which alternately moved inside and outside of Jupiter's orbit. Because of its travel on its outer orbit, the lighted face of Jupiter would not have had the distinct phases like the Moon does today.

Additionally, when Jupiter was seen through the obscuring equatorial rings of the Earth, refraction of the light would have created large adjacent left and right crescents. This easily accounts for the prevalent double axe imagery (the labrys) of the early Neolithic which shows up in Gimbutas's collection of images.

[\[return to text\]](#)

Note 16 --

Figurines occur in Europe, throughout Asia, Africa, and in Central and South America. Japanese Dogu figurines of the Neolithic, also naked and female, have the same flat-faced bird-beak features as many Eastern European figurines. Figurines are found in the Mexican Neolithic to about 2500 BC. These are also naked and female, and have been described as having "strange hair-do's."

As I have stated, in Western Europe the Venus Figurines are first seen in 29,000 to 21,000 BC (centering at 27,000 BC), and then disappear until the period of 17,000 to 14,000 BC. If it were not for this enormous gap in time (much longer than all of recorded history) I would have never made an association between the image in the sky and the small hand-held figurines. It is inconceivable that these figurines would not disappear from cultural transmission during a period of 10,000 years, unless the nearly identical icons had a source other than age-old memories.

[\[return to text\]](#)

Note 17 --

Other reasons for the proliferation of the figurines in the European Neolithic are that there were more people, and pottery and baked figurines were being made at that time. Because

these people were farmers, there were now agricultural settlements, which resulted in the concentration of archaeological artifacts. Farmers arrived in Central Europe after about 5500 BC. The arrival of farmers (and herders) in Macedonia, Greece, Italy, and Spain was earlier.

I would not propose that the early figurines were "fertility symbols" as many others have. Foraging humans of the Upper Paleolithic didn't need or want fertility, especially if traveling in hunting groups. It is more likely that the figurines represent an "infertility" symbol -- a prohibition against coitus unless commanded by the Fat Lady in the sky. That would have served women better throughout the Paleolithic and early Neolithic.

Perhaps the arrival of the Fat Lady announced the time for reproduction and child bearing. Then the infrequent appearances of Saturn might account for the slow rate of growth of farming communities before 3000 BC -- as indicated by the length of time some early villages remained the same size.

[\[return to text\]](#)

Note 18 --

With a change to arc mode the resistance drops. Once in arc mode, additional current decreases the resistance, so that the change to arc mode in effect represents a run-away condition.

Uranus visually disappeared behind Saturn as the Earth moved closer to the center of rotation of Saturn. (Uranus fits exactly above Saturn, even though offset from the center of rotation.) In very early (and predynastic) Egyptian iconography Uranus shows up as the captive held by his hair who is about to be clubbed by the pharaoh. He is placed on the lower right side of the image, so at the lower left of the pharaoh (grabbed with the left hand). In actuality Uranus had disappeared from view (the *Chilam Balam* records Uranus sinking into Saturn), and the imagery of being clubbed would be legitimate of describing Uranus's fate. It is presented in the past tense.

[\[return to text\]](#)

Note 19 --

It was Gimbutas who developed the idea of the Kurgan invasions. She dates these to three periods, 4400 - 4200 BC, 3400 - 3200 BC, and 3000 - 2800 BC. Indo-European speakers may have occupied a large region of Central Asia. I think the Indo-European languages were probably first introduced by the invading Neolithic farmers from the Black Sea region, called "Old Europeans" by Gimbutas, heading directly west into Central Europe, rather than by the later Kurgan herders. This happened probably soon after 5600 BC, and included migrations into Italy and Spain.

Tribes speaking an Indo-European language reached as far east as the western borders of China. The Kurgan invasion north into Russia, Germany, Lithuania, Latvia, Britain, and

Ireland happened separately from the first wave which, like the earlier farmers, also headed west into Europe. There are later Indo-European incursions (after 2500 BC) into India from Central Asia, followed by entry into Persia (apparently from India), and into Greece by people who are linguistically closely related to each other, but less so to other, older Europeans.

[\[return to text\]](#)

Note 20 --

See Cynthia Eller *The Myth of Matriarchal Prehistory* (2000). But like Gimbutas, Eller argues from the symbolic (that is, metaphorical) meaning of artifacts rather than their basis in representing an aspect of reality, and imposes modern attitudes on a radically different people and era. However, I agree with the following (I have broken up a long paragraph, below):

"This symbolic code [she is talking about scratches and scrawls] leads feminist matriarchalists to speak as though there were no relevant difference between the essential focus of religion in Siberia in 27,000 BCE and Crete in 1500 BCE. They usually treat all of prehistoric Europe and the Near East as if it were a single cultural complex, viewing cultural variations as an epiphany of the multiplicity of the goddess rather than as evidence of distinctive religious beliefs or systems of social organization."

Eller makes the case that these few artifacts cannot be extended to institutions or religious practices of which we know nothing. Her statement, above, certainly represents the strongest claims against a unified prehistoric religion or mentality. But on the other hand, it is precisely the existence of a single worldwide phenomenon that produced the remarkable similarity of imagery, not just from Siberia to Crete, but from end to end on every continent, and strung out over a period of 30,000 years. The spectacularly consistent iconography, which may have expressed widely divergent religious beliefs and practices, takes its unity from actual celestial events.

[\[return to text\]](#)

Special thanks to E Boettger for suggesting that I add these chapters before the "Era of the Gods."

Calculations are in Unix bc notation, where ^ denotes exponentiation; the functions a(rctangent), s(ine), and c(osine) use radians; angle conversions to radians or degrees by the divisors rad=.0174 and deg=57.2958; other functions are shown as f(); tan()=s()/c()

Contents of this chapter: [\[The Hand Axe\]](#) [\[Lascaux\]](#) [\[Catal Hoyuk\]](#) [\[Endnotes\]](#)

The Hand Axe Revisited

Having suggested in the previous chapter that Saturn appeared (and was recorded) in the Upper Paleolithic and in the Neolithic as a composite set of four (or five) planets, it is time to extend this idea backwards in time with some additional well-founded speculation.

[Image: Cutting pebble, naturally backed end scraper or cutting tool, Acheulean hand axe. All from the Oldowan culture, Africa. Shown in order of historical development. After Jacquetta Kawks, "Prehistory" (1965)]

As I mentioned in a previous chapter, the Acheulean hand axes of the Lower Paleolithic (from roughly 1.5 million ya to 40,000 ya) -- which had appeared over the course of more than a million years in Africa, Europe, and Western Asia -- look so much alike that they seem to have been manufactured from blueprints which were universally available for a million years. I will now suggest that this blueprint was seen in the skies near Earth, and, in fact, the model object was seen launched through the skies, just as hand axes were meant to be thrown.

What hints at this is the off-center location of the almond point of the Acheulean hand axe,

clearly shown above. The offset serves no purpose in its use, yet it is always there. It looks like we are seeing Saturn (with Neptune?) and Uranus locked in the usual position of having their magnetic poles located together, so that an extensive coma, enclosing both, is rounded at the bottom, peaked at the top, and offset in one direction. The rotation of Uranus in the plane of the ecliptic would cause the figure in the sky to look three-dimensional yet flattish. All sides of it would be seen over the course of a year or with a number of passes.

Homo erectus did not add or subtract anything from the original design. The sharp edges on all sides of the hand axe were the inadvertent result of chipping the stone to shape. The large size was mandated by what was seen at arm's length, which suggests that Saturn and Uranus were seen relatively close to Earth, although it is more likely that instead we are seeing a much more extensive coma. The centers of the two masses constituting the Acheulean hand axe, the rounded main portion and the peaked upper part, are in the same proportions as the much later body and head of the Venus figurines.

What argues against Homo erectus having thought up, designed, and tested this assault weapon on his own, is not only the small size of his brain, but also the fact that no further inventions were ever made. When Homo neanderthalensis appears, a million years later, he develops stone cutting tools in the blink of an eye. [\[note 1\]](#)

Homo erectus kept the off-center almond point dictated by the original blueprint, but also kept the unwieldy size. A hand axe of half the size would have weighed one quarter as much, could have been thrown further and more accurately, yet would have done nearly the same damage. Did anyone ever think to test this idea? Did any Homo erectus ever think? Homo erectus did, however, have the mammalian facility for imitation, and the cultural structure to spread this idea everywhere. At least, everywhere in the world where antelopes congregated at watering holes. (The tool is missing from the jungles of Eastern Asia.)

If my speculations are correct, it means that Saturn, as I already suggested, remained within the inner domain of the Solar System after its re-entry three million years ago, at least, periodically. One and one-half million years ago Saturn was seen for extended periods of time by our remote ancestors (seen for periods of a hundred years or more among the inner planets).

Mars was not part of the Saturnian planet system at that remote time, for otherwise Homo erectus would have developed the stone dagger instead.

Gimbutas documented the Neolithic (7000 to 3600 BC), the first period to have small villages and communities in Europe which in turn provided accumulations of discarded pottery and sculpture in concentrated locations. The Upper Paleolithic (roughly 40,000 to 10,000 BC), in contrast, is the era of wandering hunters in Europe and Asia. These people left nothing behind for us to find except infrequent kill sites, occasional rock shelters, a few figurines, and -- by chance -- some 300 decorated below-ground caves throughout Europe and into Asia. One of the best known of these is the decorated cavern of Lascaux.

Lascaux

[Image: The cave at Lascaux. An aurochs and horses. After lascaux.culture.fr]

In 1960 André Leroi-Gourhan and Annette Laming, in an analysis of the cave of Lascaux (15,000 BC -- 10,000 BC), concluded that, invariably, the drawn figures of animals in alcoves face each other and are paired by types -- a horned animal (aurochs or bison) against a horse -- and suggested a male-female dichotomy. What was the meaning of this? Neither of these animals were hunted and, although Lascaux and some 300 other caves are overflowing with images of wild animals, the execution of new images could not have been all that frequent for the caves were apparently in use for extremely long periods. The occasion to execute another "aurochs and horse" scene must have been very infrequent. [\[note 2\]](#)

... folklore and thesis

Leroi-Gourhan, in *The Art of Prehistoric Man in Western Europe* (1968), writes:

"To take what is known about prehistory and cast for a parallel in the life of present-day people does not throw light on the behavior of prehistoric man."

Of course, this -- reconstructing prehistory on the basis of contemporary behavior and thinking -- is exactly what has been done anyway. The reconstruction was started by the Abbe Breuil, early in the 20th century, who (as Leroi-Gourhan notes) formulated the whole of the folklore tradition of Stone Age big-game hunters -- hunting magic, initiation ceremonies, dancing shamans, pregnant horses, nubile naked women -- and even an art-historical development of imagery. Leroi-Gourhan, despite his own warning, does the same

by assigning symbolic meaning to the images, expounding a "dualistic concept of the universe, governed by two complementary principles, male and female," as paraphrased by Denis Vialou in *Prehistoric Art and Civilization* (1996).

The folklorish elements can be readily dismissed and, in fact, Leroi-Gourhan has mostly done so in his book. Countering Leroi-Gourhan's thesis of a universal duality, however, will take some additional consideration.

To begin with, these people were not "big-game" hunters, despite the fact that the animals depicted in the caves consist almost exclusively of large herbivores -- aurochs, mammoths, rhinoceroses, horses. (There are also a few bears and lions.) And in addition to the herd animals, fish (salmon) and birds are also to be found. Plants are never depicted. From the evidence of bones at campsites, however, the diet of these hunters consisted almost entirely of deer -- red deer, reindeer, elk, and ibex -- which would have been a lot easier to hunt than the giant aurochs or mammoth. And who would want to go up against a bear or a lion for a meal?

The idea of "hunting magic" can thus be disposed of immediately. This, despite the fact that a number of the animals are shown with spear wounds. Leroi-Gourhan notes that these represent 15 percent of the images. If the images were meant as magic to aid hunting, we should probably expect a much higher percentage of animals being attacked.

The idea of "initiation ceremonies" was derived from one set of small heel prints, supposedly of children, in one alcove in one cave. This is the sort of single data point through which any number of lines could be graphed. It begged to be equated with initiation rites of contemporary primitives by anthropologists.

Human forms are counted in the hundreds, whereas the herds of animals count in the thousands. The humans include "dancing shamans" and naked headless women (but depicted only by a few curved strokes). They are interspersed with the animal sketches. As a generalization, it could be said that when the figures are male, most, but not all, have the heads of animals. If they are female, they are headless and shown only as a trunk with hips, thighs, legs, and breasts, drawn in a few cursory strokes. The human bodies are badly articulated. They show none of the elegance of the drawings and engravings of the animals.

"At most one or two faces could pass as realistic; the profiles or the full face heads with animal features are even less realistic."

"The outlines [of human figures] are equally improbable and resemble puppets or simple ghostlike silhouettes. The bodies generally lack anatomical shapes, the limbs are poorly joined or out of proportion."

-- Denis Vialou

The naked (female) human figures, coupled with occasional pregnant horses or bison, would, from our modern perspective, suggest the fecundity of nature, but I really doubt if the Cro-Magnon cave painters had anything like this in mind, and certainly not as a universal concept or a symbol, for there are no copulation scenes and no calving scenes.

To art historians, the drawings initially suggested a progression from primitive depictions to more developed forms. This last concept was shattered with the discovery of Chauvet Cave in 1994. The cave has without a doubt images of the highest "aesthetic quality, [and] technique" (Vialou), yet it is the oldest decorated cave, dated to 31,000 years ago.

To Leroi-Gourhan there is a very slow progression in the depictions, suggesting a continuity of mythical concepts. He observed that over the course of 20,000 years the Cro-Magnon never "reinvented" (his words) the symbols for their rituals, but only evolved them (this is astounding).

"The first thesis that we shall defend here is that the evolution of European Paleolithic art is homogeneous and continuous and that it implies a cultural continuity and homogeneity of the human groups that produced it."

I would agree. On the other hand, there is a progressive development of tool fabrication and other innovations, including many instances of regional "fashions" which often spread elsewhere, and which only stops after 10,000 years ago (8000 BC) -- seemingly evaporating and disappearing, as others have noted. What doesn't change is the understanding of what the depicted herd animals represent. [\[note 3\]](#)

To Leroi-Gourhan the cave depictions become evidence for a single mythology and a single symbolic expression. And it is here that I disagree. The very fact that the methods of depiction and the compositional model remain the same over an absolutely astoundingly long period of time -- although there are some regional differences -- is what makes Leroi-Gourhan's thesis fail. As I will develop in later chapters, these people simply were not like us in their thinking. We cannot attribute to Cro-Magnon a level of abstraction comparable to modern humans, whose abstract thinking spins wildly, changing constantly to evolve to something completely different in the course of a single lifetime or even in a single day. If there is an error in attempting to understand the 20,000 years of cave art, it is in attributing to Cro-Magnon the ability to think abstractly.

Thus I disagree with giving these people credit for "universal concepts" or for a developed mythological system and an attendant symbolism. Over the following chapters I will argue, based on the work of Julian Jaynes, that our ancestors were incapable of extending their imagination to abstract metaphorical thinking until after 1500 or 1000 BC. The Sumerian, Akkadian, and Egyptian languages were "concrete from first to last," says Jaynes. So was their thinking, in that thinking is embedded in language. Only after about 1500 or 1000 BC do we see a more extensive use of similes, and with that the rise of the symbolic use of language through the use of metaphors. [\[note 4\]](#)

The possibility of a people without the imagination (subjective consciousness) to conceive of symbolic equivalents or formulate a mythology to explain their existence -- as Leroi-Gourhan holds -- will be hard for many readers to comprehend, for all of *our* reasoning is by metaphors and we simply cannot imagine any other way of thinking. Symbols for us are the shorthand of abstract thought. [\[note 5\]](#)

It would be reasonable to suggest that the Cro-Magnon humans couldn't conceive of any abstractions; they were capable of comprehending only specifics. They could certainly be expected to be resourceful, inventive, curious, creative, friendly, chatty, capable of extensive dialogues on relationships, plants, animals, and geography, but otherwise of a mind totally defined by the visible environment. And, to our benefit, they had a singular urge and need to paint caves at long intervals, which they did for a span of 20,000 years without once reconsidering what they were doing. The cave painting stops only when the climate changes in Southwestern Europe to that of a near desert after about 8000 BC, and Cro-Magnon migrates away from the limestone caves.

If the drawings in the caves cannot to be understood as symbols, then they need to be seen as transcriptions from the specifics of reality. But what were these people seeing that needed to be recorded? And why did this need to be recorded at all? Before attempting to answer these two questions, I need to supply a few more details about the caves and the drawings.

There are, in all, about 300 decorated caves in France and Spain (with a few elsewhere), mostly located in regions which are filled with limestone caves. The dates span almost the whole of the time since the first arrival of Cro-Magnon in Western Europe (40,000 to 35,000 ya), starting in about 31,000 ya and ending a little more than 10,000 ya (thus about 8000 BC). The selection of new caves to decorate happened regularly, with some clustering at the Gravettian culture (28,000 to 23,000 ya) and at the Magdalenian culture (17,000 to 14,000 ya), which last includes Altamira and Lascaux.

... cave art details

Thus, on average, a new cave is selected for decoration every hundred years, or a little less frequently, and then it is left behind. At least, this is true for the earlier caves. For a few caves we have accurate dates for when they were revisited. Chauvet Cave (dated 31,000 ya) was reentered four thousand years later. Cosquer Cave (dated 27,000 ya) was revisited to draw animal figures eight thousand five hundred years after it was first marked up with lines and finger scrawls. On the other hand, some 100 "lost" oil lamps have been found at the relatively late Lascaux Cave (dated 17,500 ya), suggesting repeated visits to the cave by large groups of people. Cave art was never erased or vandalized. [\[note 6\]](#)

The same form of depiction is used for the animals for 20,000 years. They are shown as herds. There is a cave of elephants. There is a cave of reindeer. Elsewhere it is a mix of animals, but always they are on the march. Even bears and panthers are shown following

each other in lines. They are seldom in groups larger than a dozen in any particular location in a cave, even though the drawings and engravings may cover every available surface. Drawings are often separated by species. The animals move in both directions, often overdrawn on each other. Animals of different species are indiscriminately mixed and all the figures vary in sizes, as if to suggest a receding perspective for some animals, although this is reversed for superimposed images (small drawings in front of larger ones). All the animals are shown in profile.

"Palaeolithic cave art, the art of the big-game hunter, depicts neither hunting, the hunter, nor the hunted animal. The protagonists are close, and touch, but they do not see each other. Animals and humans completely ignore each other on the walls, as if they were floating in space, in a purely imaginary universe."

-- Denis Vialou

"Floating in space" is an apt description, for none of the drawings are grounded. The animals look like cutouts pasted to cave walls.

"They appear to be suspended in midair with no base line depicted, outside any context -- no landscape, no housing, no scenes involving people and animals."

-- Jean Clottes and Jean Courtin (1996) [\[note 7\]](#)

Others have additionally noted that many of the animals have their hooves turned back, if hooves are shown, so that the animals certainly are not standing. They appear to be lying down or dead.

In addition to the figures, there are symbols, something which is entirely absent from rock face carvings and depictions of animals in rock shelters throughout the same region and throughout the same period of time. The symbols are of four types:

- Hut-like signs which were earlier thought to represent housing, called "tectiforms." About 50 have been found, generally using the same form for a particular cave. (See image below.)

[Image: Left, hut-like signs: Font-de-Gaume Cave; right, rectangles: Altamira Cave.]

- Single chevrons (inverted V) shown on the flanks or shoulders of animals, at times with a long central line, making it look like a spear thrust into the animal.
- Dots and bars, in groups or in a line, almost always associated with animal images. These appear by the hundreds.

- Strange lines with loops, described as "claviforms" -- shaped like the letter "P" -- consisting of a vertical line with a circle touching it near the top or a second line which angles up from near the bottom and loops across the straight line. About 50 have been found, in widely separated regions in six caves.

[Image: Geometrical claviform markings, Spain and Southern France.]

Archaeologists have interpreted the claviforms as "boomerangs, clubs, axes, stylized female figures, rods with attachments" -- with some suggesting these forms to be part of a system of enumeration, for they are also found near sets of dots and at times repeated across animals.

[Image: Left: Bison with claviforms, dots, and a chevron marking; Pindal, Spain. Right: Horse with 14 claviform signs, Trois-Frères, France.]

Enumeration seems to me to have the most value, but to prove, for example that the claviform symbol stood for a larger number representing some count of single dots, would require a detailed look at the marking of hundreds of caves. If one counts on fingers, phalanges, or knuckles, the larger accumulated number would be represented by a single hand (or two). This might be 5, 10, 12, 16, 20, 32, and larger sums -- all forms which seem to have been used in antiquity, which suggests that this is likely true also for remote antiquity (see endnotes of Appendix A for some details). The Basque, a people indigenous to the region of northern Spain where many caves are found, have an old system of cyphers for enumeration (used by millers), which uses the line with a loop claviform sign to represent 20.

Except for Leroi-Gourhan's questionable thesis of the symbolic depiction of the male-female dichotomy of the Universe -- a Cro-Magnon Universe limited to people and game animals -- there is no other current explanation of the painted animals or the markings. Descriptions tend to be augmented with formalist analysis in the vein of art criticism and appeals to vague desires used to explain the urge to create graffiti today.

Denis Vialou writes, about the depictions of humans: "... *there seems to be a deliberate desire to move away from ... visual objectivity.*" About the early scribed finger marks of Cosquer Cave, Clottes and Courtin write: "*the intention ... can only have been the appropriation of*

underground space," and about hand marks: "The hand expresses personality, the presence of an individual. ... these hand stencils are no doubt filled with the deepest significance." The objection to any such readings is, first of all that this is nonsense, and secondly that "individuality" is a very late philosophical concept, entering common thinking only in the last few hundred years.

... signs in the sky

It is apparent that no one knows what to make of all this. And indeed it is a giant puzzle. How and why did these people persist for 20,000 years in the same process of cave depictions at intervals separated on average by a hundred years?

What I will suggest here is that the Cro-Magnon people were recording the display of an infrequent and absolutely astounding celestial event. As an approximation of how frequently these events happened, we could divide the time span of 31,000 ya to 11,000 ya (20,000 years) by the number of caves (about 300), and suggest that at the most these events happened every 66 years. But in the whole of the area where the caves are found -- from the Rhineland to Southern Spain -- there are perhaps four (or more) geographically isolated regions. This suggests that perhaps four or more separate "ceremonial centers" might have existed at any one time, and possibly the event was only celebrated once every 100 years or more at each center. Additional caves continue to be found every year, however. [\[note 8\]](#)

Today we would not consider an extensive journey by foot across half of Europe -- complete with families, baskets, nets, and kitchen tools -- as a particularly desirable undertaking, even if this were only done once every other lifetime. We would prefer to have a local "ceremonial center." On the other hand, it might be fun. And in the Upper Paleolithic, as in all of antiquity, distance was never an obstacle. So it is possible that people from a large area traveled to and congregated in one place. Food was also not likely to be a problem. Considering that today the Kung of the Kalahari desert spend only 12 hours a week foraging for their families, there is good reason to believe that large crowds could be supported with locally gathered food in some single region of France.

How these people organized their cave decoration efforts, and how frequently this happened, has to be complete speculation. We know almost nothing of their movements or social interactions. We know more of the Neanderthals. Cro-Magnon occupied Western Europe for 30,000 years without having their numbers diminished or being displaced by other peoples. From the archaeological records of rock shelters in Southern France, which were occupied for brief periods or only seasonally, we can be certain that people indeed moved around quite a bit. As nomads they would have had an awareness of large geographical areas, and we can be reasonably sure that there was active communications between tribes and families. Trade items (stones and shells) which traveled vast distances also document the existence of interactions between separate tribes. [\[note 9\]](#)

What we know for certain is that new caves were decorated every few lifetimes or so. We also know that there was a continuity of the formal aspects of the images, and that many of the graphic signs moved from cave to cave. This points to a cultural continuity between family members across a generation or two. It also starts to suggest that it was the activity of decorating a cave which was the most important thing, rather than the display of images or the ownership of a decorated cave. In this respect, the cave-decorating activity would be little different from what we see of the constant construction and reconstruction of ceremonial centers in Western Europe at a much later date -- the barrows and henges. None of the cave artwork was ever destroyed. Cosquer Cave, entered 8500 years after it was first marked up with finger lines, was considered a prime location, for there were no animals depicted as yet, and was filled with animal images in about 18,500 ya.

At this point we have to consider some sources for the images, assuming as always, that the humans were imitating something they saw, and casting it in terms familiar to them from their own environment. I'll suggest three possibilities, based on what might have been seen in the skies during the Upper Paleolithic.

- The sight of Jupiter in the day skies when seen as an inner planet (between the Earth and the Sun). Jupiter would display a slim crescent, produced by the light of the Sun on Jupiter's Sun-side portion.
- The sight of Saturn in the skies -- seen as a combination of three or more planets stacked up above each other, and the whole enclosed in a coma shaped to the globes and to their equatorial toroids.
- The sight of an assembly of comets traveling into the inner reaches of the Solar System and crossing Earth's orbit, wildly lighted by their individual comas and the plasma connections between them.

Of these three, the first seems least likely. I cannot really identify a crescent on Jupiter among the cave images. It is possible to suggest that the images of giant aurochs, with their enormous sets of horns, might represent Jupiter's crescent, but aurochs only appear in some locations. And aurochs' horns do not form a crescent. The various menageries seen in individual caves reflect the wildly divergent climatic conditions of Europe over the course of 20,000 years. During Cro-Magnon's occupation of Western Europe, the fauna changed with climatic conditions for periods of 500 years to as long as 4000 years.

The second, the image of Saturn in the skies as the body of a woman, is also unlikely as a cave image, although this image appears outside of the caves as sculptures. The Venus Figurines of the Gravettian (28,000 to 23,000 years ago) -- bulbous, fat, and very female -- and again in the Magdalenian (17,000 to 14,000 years ago) -- skinny, malformed, but still female -- attest to the fact that Saturn was seen, but this image does not appear among the cave paintings. There are, however, numerous figures of naked, headless (and disarticulated) human females scratched into the cave walls, notably without coloration or shading (except for occasional cross-hatching). It would seem that Saturn was thus recognized among the cave art, but was not rendered realistically.

The crudeness of the rendering of the "female forms" is a particular ineptitude which extends far into the future. This extends to figures of males also. As these people were not subjectively conscious, they never formed concepts of themselves in their minds. The same strange disarticulation of limbs and body parts is seen in all the two-dimensional renditions of humans of remote antiquity in the Near East. [\[note 10\]](#)

Our modern day "image" of ourselves is based on a mirror-like concept of how we think others see us (Jaynes). We conceive of other humans in a like manner. Surprisingly, this does not seem to apply to three-dimensional representations, either in the European Gravettian or much later in Sumer or Egypt. The failure to make changes in the cave-art depictions -- over a period of 20,000 years -- is an additional sign of the lack of subjective consciousness. As Leroi-Gourhan suggested, the cave drawings were never reinvented.

At least, that was the opinion I held until 2011 when I again plotted a survey of dates for the caves against a graph (in this case) of the "Fractional global radio-carbon since 50,000 bp" which I have used earlier in this text to validate that there were no Venus Figurines made during the Solutrean period (24,000 ya to circa 17,000 ya) -- suggesting that Saturn was not seen near Earth, or possibly that Saturn did not interact with Earth for 7,000 years. That turned out to be so, and was soon validated from other sources.

Information on the decorated caves of France and Spain has advanced considerably since I first started researching nearly a decade ago. Peter Peregrine and Melvin Ember in *Encyclopedia of prehistory, Volume 4* (2001), mention the following about the Solutrean period:

"No examples of cave art can be definitely attributed to the Solutrean period, but there are several cave art sanctuaries whose only associated cultural deposits are of that age. They include such important sites as Chufin, La Haza, and possibly La Pasiega in Cantabria, El Buxú and Peña Candamo in Asturias. Many other cave art sites have Solutrean as well as Magdalenian occupation levels."

By "occupation levels" Peregrine and Ember mean the slight evidence of lost artifacts and carbon remains of fires and torches. Except for the mouths, the caves were not used for living quarters.

Because there is an 8,000- to 10,000-year gap (from 27,000 or 24,000 ya to 17,000 years ago) in the carving of the figurines, it would seem that Saturn remained unseen for an extended period. There is a gap in the cave drawings also, as I have indicated above. We would have to conclude that there was a relationship between sightings of Saturn and the herds depicted in the caves. But it is time to ask, why the herds of animals?

I presume that the animals are, very simply, the display of a concentrated group of asteroids in plasma discharge -- that is, comets. It must have been absolutely spectacular, an event only

sporadically repeated, and thus always unexpected. Most likely this would be a large number of objects pulled out of the asteroid belt, which Saturn had passed through many times, and perhaps recently. Jupiter, in its later single passage through the asteroid belt managed to acquire 1800 or so followers which remain today, divided up into two groups each one third of an orbit removed from Jupiter, called the Trojans and Greeks. Neptune has a few of these. Mars today still has a half dozen Trojans. Saturn, in its many passes through the asteroid belt, might have had many followers whenever it appeared in the inner Solar System.

To the Cro-Magnon the question must have occurred, What are these? There were only a few answers available from among their environment of mountains, rocks, rivers, plants, animals, and other humans, and only the concept of animal herds would answer to all the details of what was seen. The objects moved across the night sky in unison like a herd of horses, bison, or deer, they were of diverse sizes and shapes, some had horns, others did not, some had tails -- and some were obviously in front of others.

Comparing the record of the frequency of comets seen today against the frequency during, for example, Roman times, shows that comets have appeared less and less frequently during the last two thousand years. Rome recorded 50 comets per year. Today we seldom see a comet. If the display of animals in the sky was only infrequent then there might have been hundreds of thousands to be seen 30,000 years ago.

I am not proposing that the skies were filled with comets on a daily basis. Because anything seen all the time would not have been noted as spectacular and would thus not have required commemoration. What I am suggesting is an occasional overwhelming display -- like repeating "meteor showers" which we still have today. The "meteor showers" seen today are microscopic dust from prior disintegration of comets (meteors) which only shows when the dust electrically brightens on entering the Earth's ionosphere.

Some of the "swarms" of meteor dust, which the Earth passes through currently, only become spectacular at long intervals. The Leonids, for example, is a cloud of meteor dust which the Earth passes through between November 13 and November 21 each year. In most years, the display amounts to only a few streaks in the sky every couple of minutes. In AD 1833 there was a spectacular display of 100,000 to 200,000 per hour -- at that time it was the largest meteor shower seen in modern times. This repeated 33 years later in AD 1866-1867 but was not seen in AD 1899-1900. The spectacular display of the Leonids otherwise repeat every 33 years, returning again in AD 1933, 1966, and in 1999. The dust and particles travel with comet Temple-Tuttle -- which enters the near reaches of the Sun every 33 years. There are a dozen well-known meteor showers.

The meteor showers, today, are the last remnants of larger, earlier swarms of asteroids traveling on elliptical paths which crossed the Earth's orbit. Today the "showers" are created by the dust entering the Earth's upper atmosphere. In the past, the plasma discharges (lightning) among large concentrations of asteroids would have been spectacular. Moving across the sky, but stationary with respect to each other, the only analog for Cro-Magnon

would have been a herd of animals seen from afar. This is why the species depicted in the caves change over time and by location. The cave drawings were not made to depict species which could be hunted (and were not), but to depict the slow passage of immense herds of celestial animals. All were shown in profile because they were on the move -- or dead.

The drawings are totally modern by our standards, with a sophisticated feeling for outline and shading -- unequaled again for thousands of years. At the age of ten, Picasso crawled into one of the caves in the company of his father, a painter, and the Abbe Breuil. It changed modern art.

Cro-Magnon applied all of their science, which wasn't much, to the depictions. Probably their most advanced intellectual accomplishment, aside from their social skills, their lithic industry, and their knowledge of the environment, was an ability to count. The many dots and bars, found adjacent to and on the animals, likely represent just that. The claviform marks could be added to the counts also.

Five thousand years after the last cave was painted, the Egyptians of the first dynasty, 3050 to 2850 BC, do the same: they count the small and large cattle of the God Horus (Mars), and record the counts, which in one year added up to 400,000 large and 1,200,000 small animals, plus 120,000 "captives" -- figures far in excess of anything that either warfare or the economy of Egypt could have supported if these reflected earthly animals and people. Mars, before assuming an orbit among the inner planets, traveled into the asteroid belt also.

The cattle of Mars are noted again in the 8th century BC, when Mars again cruises close enough to Earth to be clearly seen and delivers devastating electric arcs to regions of Earth. In India the cattle are held to be the six warrior companions of Indra (Mars), called Maruts, the "terrible ones." The Bible calls them the "heavenly hosts of the Lord" (Joel and Isaiah). They thus were seen for 2600 years. Much of this might have been dust and rocks. Late in the 20th century AD, telescopic studies revealed six large objects still following Mars in its orbit.

When asteroids interacted with each other, it would have been with lightning bolts. Comet Biela in 1846 sent a lance of light at right angles to its path to a companion comet, across 155,000 miles (250,000 km). In 1852 a brief bridge of light connected the heads of the same two comets over a distance of over a million miles -- four times the distance between the Earth and the Moon. Cro-Magnon recognized the streams of plasma from one comet to another as a spear thrown to wound some of the animals. But since animals do not throw spears, he invented celestial humans, often with the heads of animals, as the agents. Wounded animals are shown with chevrons, some are shown with embedded spears.

Still we have only a slight idea why the herds of animals needed to be recorded. It is possible the close passage of streams of blazing asteroids (comets) would have been accompanied by meteor impacts, detonations like the AD 1918 Tunguska event, or fire falling from heaven (with dust from the decay of the comets which might have entered the Earth's atmosphere). It is difficult, however, to see the cave painting activity as some means of warding off evil --

that is, as magic. A belief in the efficacy of such preventive activities is a very late cultural development, clearly dating to after 1200 BC. It would be simpler to suggest that the animals were painted simply because they were seen, and were not seen very frequently. [\[note 11\]](#)

None of the caves were occupation sites; apparently the Cro-Magnon painters did not even bring a bag lunch. But the images in the caves, when seen by others, lighted by fires, oil lamps, or torches, would have recalled the night sky during the few months, years earlier, when large "herds of animals" roamed the skies.

At this point I have drifted the speculation as far from the data as Breuil did earlier in the 20th century, but I have gone in a different direction, assuming that these people were not at all like us and cannot be compared to contemporary "primitives" like the Eskimo, Bushman, or Australian Aborigines.

Additional speculation might indicate that we see in this imagery the first suggestion of the sky as a place -- among the stars -- for the after-life for dead animals, which over the course of 30,000 years will extend to humans. After 10,900 BC, a new way of securing life after death will be demonstrated by new images in the skies. The forms will change again after 4077 BC, and again after 3147 BC. Although the Egyptians will democratize the concept of living forever in the sky, it never catches on among the Greeks and Romans until the advent of the salvation religions. In the *Odyssey*, Hades is described as a place of the miserable walking dead.

If fear did not motivate the Cro-Magnon, if appeasement of celestial herds was not an issue, then what drove these people to repeatedly create the cave artwork? Except as speculated above, I have absolutely no idea. But the pride and sheer joy of making images, which we also see in the spear throwers decorated with carved animal figures, is an appealing concept.

For "public art," as opposed to portable objects, pride in the creations would sooner or later require that the work be identified with the creators. A suggestion, made by the researchers of the early 20th century, but which has since fallen into disfavor, is that the "tectiforms" symbols found in some of the caves represent housing -- and thus the signs would have the value of a signature particular to a clan or family. These appear late, in the Magdalenian after 18,000 ya, at Altamira and other locations. It is a suggestion which might again be entertained. [\[note 12\]](#)

The Sky at Catal Hoyuk

Catal Hoyuk is a village in Central Anatolia, which was partially excavated in the 1960s by James Mellaart. It is currently (since 1993) being excavated again. The occupation dates are from 7500 to 5700 BC (2015 data), after which it was abandoned, for what reason we do not know (although the abandonment coincides with a severe drought in the Middle East). The village lasted for over a thousand years. What is unique about Catal Hoyuk is the decoration

of houses with sculptures and murals, many of which have been reconstructed. Today Catal Hoyuk is recognized as one of the primary archaeological sites in the world representing the early Neolithic. [\[note 13\]](#)

Catal Hoyuk is of interest to the Saturnian Cosmology thesis because of the date range of its existence, 7500 to 5700 BC. During this period Sunlight was no longer blocked by dust in the stratosphere, but a coma surrounding and below Saturn might have obscured the stars. The Sun would probably have been seen. The imagery of Catal Hoyuk could thus be expected to reflect what was seen in the skies as the Earth had moved below the center of Saturn, and below the level of the Sun.

Based on a reconstruction by Orrin C. Shane III

[Image: Catal Hoyuk, Central Anatolia, 7400 to 6200 BC. This artist's rendition represents the excavation of a few percent of the mound by Mellaart. Not shown is the mound of dirt behind this set of houses. After Mellaart.]

What had also happened since 10,900 BC, was the generation of three brilliant ball plasmoids in the far south, which rotated into view on a daily basis. From the ball plasmoids lines of blazing electrons streamed through the sky past Earth and toward the north, surrounding the Earth. Only three or four were visible anywhere on Earth in the overhead skies. Details were presented in the previous chapter. As could be expected, memories of the streamers show up among the wall decorations at Catal Hoyuk.

I should also again introduce the notion of the Absu, which I mentioned in a previous chapter. There I suggested that the Earth would most likely have had rings of material above its equator, much like all the outer planets, and which probably looked like the rings of Saturn. Later (much later) testimony supports this, and it is especially noted when, in 2349 BC, the rings disappeared, dispersing or falling -- an event which was universally held to be a

flood of the celestial "ocean," and known as the "flood of Noah." "Absu" is the Mesopotamian word for the rings; it translates as Abyss -- the Deep.

People living in the northern hemisphere would have seen the rings in the southern skies at night. Egyptians describe the rings, which they called the "Duat," as composed of spoked rings, looking like reeds growing in a swamp. At the latitude of Egypt, Mesopotamia, or Anatolia, the rings would have stood some 40 or 50 degrees up in the sky, below the semicircle which defines the equatorial, reaching in an arc from directly east to directly west, and standing up from the south at an angle determined by the latitude. The rings would all meet at the east and west cardinal points of the horizon (bunching together). At night the Absu was brilliant and clearly seen because the rings would have been lighted directly by the Sun (from the daytime side of Earth), except where the shadow of the Earth fell on the Absu, which created an arch or gap which traveled nightly from the east to the west horizon. Only a few bright stars shone through the rings or the shadow area.. [\[note 14\]](#)

During the daytime the Absu would have disappeared from view for the Sun would light it from behind and the rings would have merged with the daytime sky, just as the shadowed portion of the Moon disappears today during daytime. During part of the year when the Sun dipped low in the winter, it too would have been obscured by the rings. No rings were ever seen in the northern skies.

The description I have offered above can be verified from Mesopotamian, Egyptian, and Maya sources, and can even be suggested from the mound construction of some North American Indians. (See a later chapter for more details and size estimates for the rings.) Because they were always there the rings were never specifically noted. They were a landscape feature, like mountains and rivers, but always moving, at different speeds, with some rings moving backwards. The humans, as a result, thought of themselves as living in a valley bordered by a sea in the south. Since the rings were a constant feature of Earth, from remotest times to 2349 BC, an understanding of what else was seen in the skies in antiquity cannot be divorced from the sight of the rings. At Catal Hoyuk, in a region well away from an ocean, the rings appeared to have represented a wall of bricks instead of water.

Three sights would have appeared in the skies above at the time of Catal Hoyuk, or earlier (by as much as a thousand years). The first of these would be the Saturnian planets, rotating from east to west on a daily basis in a large circle between the equatorial and the North Pole and progressively moving further north in the skies. This would already have been in progress by 10,900 BC, three thousand years before Catal Hoyuk.

Another would be the streams of electrons connecting the southern ball plasmoids and Saturn. This would have happened three times for a period of 2500 years, between 10,900 BC and 8347 BC. The occupation of Catal Hoyuk dates from 7500 BC to 5700 BC -- thus 1000 years after this period.

A third item would be the crescent of Jupiter during the day, still close by the orbit of Earth,

but viewed from below since the Earth was positioned below Saturn.

Each of these seem to be presented in the murals and sculptures of Catal Hoyuk, although some of the imagery might be very old iconography, dating to a thousand years before the founding of Catal Hoyuk, but kept alive through tradition.

[Image: Catal Hoyuk, Central Anatolia, 7500 to 5700 BC. City plan mural. After Mellaart]

One hint at a remembered past is what appears to be an image (a mural) of a plan view of a village with two volcanoes in the background. This is suggested to actually be a view of the twin peaks of the currently inactive volcano of Hasan Dag seen from the proximity of the village of Asikli Hoyuk, some 100 miles (160 km) away. Asikli Hoyuk was abandoned a thousand years before the founding of Catal Hoyuk, although the two volcanoes were, of course, still in existence.

... the vultures

Catal Hoyuk also had a fascination with vultures, shown in murals as giant birds, rendered in red, biting after headless corpses. Some vultures are depicted with human feet, which is actually a close approximation of vulture feet. There are wall sculptures of breasts which include vulture beaks breaking out to form the nipples. This is an obscure iconography.

Where did this imagery come from? I don't rightly know. Giant bird imagery occurs elsewhere in the world, but especially in remote antiquity. One suggestion would be that perhaps this represents what was seen of Saturn and its companion planets during the period when Earth's orbit was slowly falling further below Saturn, and Saturn was thus describing a daily flight from the east to the west, eventually to settle into a smaller circle of rotation in the sky around the North Pole.

*[Image: Catal Hoyuk, Central Anatolia, 7500 to 5700 BC. Vultures depicted reaching for headless human bodies.
The originals are drawn in red. After Mellaart.]*

Thus a likely suggestion is that the bird imagery directly represents Saturn which during this period would traverse the sky from east to west (actually the result of the Earth's rotation). Certainly the beak-like profile of the planet Uranus would suggest a bird-like image. Thus the image of Saturn as a giant bird would not be unexpected, although elsewhere (but not always) the bird is represented as seated rather than with spread wings.

This bird form, as a vulture, eagle, or hawk, is a religious icon which retains significance throughout the world, far into the future. Although it has been noted by others that the source for this might be Saturn with its rings after 4077 BC, I would suggest that the bird image showed up much earlier, and the coma surrounding the stack of planets covered the rings.

In Egypt the name-serekhs of the pharaohs are surmounted with a seated hawk from the time of the first dynasties. Hierakonpolis (Nekhen) in Egypt, an early religious center, is known as the City of the Falcon. Although equated with Horus in Egypt, which we think of as Mars, it is likely that the hawk originally represented an image of Saturn seen in the skies in its slow transition to a position near the North Pole of Earth. That means that every day for 5000 years (from about 9,000 BC to 4077 BC) it would have been seen moving through the skies from east to west -- as a shadow during the day or as a lighted object at night. [\[note 15\]](#)

The vulture's beak represents the planet Uranus. The notion of this image being a bird or bird-masked person dated back to the previous generation of Venus Figurines which show figurines with an extended neck and the beak of a bird (and also with wings, as Gimbutas noted for the period of 7000 to 3500 BC). Even well over two thousand years later, after the "figure" in the sky had disappeared, carved and molded figurines throughout the world continue to be depicted with beaks and bird masks.

Likewise the fact that the vulture frequently is shown with human legs and feet recalls the legs of the Venus Figurines, although these were never depicted with feet. The two lozenge-shaped emblems on the breast and belly of the vultures at Catal Hoyuk might depict the planets Saturn and Neptune stacked above each other, glimmering through the surrounding coma. [\[note 16\]](#)

I cannot place the headless corpses at which the vultures of the murals are snapping, except to the worldwide notion that corpses, just like dead animals, moved south along the electron beams. This had been seen worldwide since 10,900 BC.

The other element in the sky which demanded representation was the three plasmoids in the far south skies. These would not have been clearly seen, for they would have been obscured by the equatorial rings. The "teddy bears" found as wall decorations might qualify for these. [\[note 17\]](#)

There are clear reference to the lines of electrons which spanned the sky from north to south. In two clear instances is some sort of vertical graphic depicted, although there are a number of other similar depictions.

I have suggested, in fact, that the lines of streaming electrons (which would have connected the plasmoid in the south with Saturn in the north) only appeared three times over a span of 2500 years. If the image does indeed represent the electron lines then the "bricks" shown could represent the Absu. The design nearly repeats an illustration by Anthony Peratt in "Characteristics for the Occurrence of a High-Current, Z-Pinch Aurora as recorded in Antiquity," (*Institute of Electrical and Electronics Engineers, Transactions on Plasma Science*, 2003), which he identifies as a "pinch instability characteristic." Peratt shows this depicted as a petroglyph on page 1200 of the Journal. Peratt and his analysis of petroglyphs was discussed in a previous chapter. [\[note 18\]](#)

It could likewise be suggested that the curious crosses and hooks shown attached to the sides of the three wavy columns are heteromacs, traveling individual fractal dendritic (electric) structures, identified in the *Chilam Balam* as the sweepers of the roadways, as apparently likewise in Neolithic England.

The overwhelming display at Catal Hoyuk (as found by Mellaart, and since by the current excavators), however, is the profusion of six to ten foot wide spans of aurochs horns mounted horizontally on walls and also facing up on "altars."

[Image: Catal Hoyuk, Central Anatolia, 7500 to 5700 BC. Wall-mounted aurochs horns. After Mellaart.]

Although it might be suggested that the crescent shape might represent the lighted crescent rotating on the edge of Saturn, which certainly was the case at a later date, I am more inclined to suggest that the lighting of the edge of Saturn had to await the clearing of the skies surrounding Saturn in 4077 BC -- the chaos in which Saturn was enveloped, a plasma in glow mode.

I would thus suggest that Jupiter was the source for the horns and bucrania (horns attached to skull tops) used for these wall sculptures. As stated in the last chapter, Earth, traveling on an elliptical orbit (with Saturn), would alternately be located inside and outside the orbit of Jupiter. The orbit of earth would frequently be outside and below the orbit of Jupiter, which would have been seen as a gigantic crescent moving through the skies, in effect looking like the horns of an aurochs. [\[note 19\]](#)

A crescent would be seen because Earth at this time was at a location below the orbit of Saturn, and thus below the ecliptic on which Saturn and Jupiter traveled. Only the bottom of the area of Jupiter facing the Sun would be seen, looking like two upturned cattle horns. Like the crescent Moon, the remainder of the globe of Jupiter would not have been seen during the day. If the crescent on Jupiter had been a regular phenomenon, it would not have been considered significant enough to be reproduced in sculptures and murals. Since there is no reason to think that the orbit of Earth (and Saturn) and Jupiter had fallen into a harmonic relationship, the appearances of the horns might very well have been unpredictable. Jupiter might have been entirely absent for years. This is of course precisely the condition under which humans would make the image into a god. The unpredictable behavior presumed that the object in the skies was alive.

[Image: Catal Hoyuk, Central Anatolia, 7500 to 5700 BC. Wall-mounted aurochs horns and freestanding "horns of consecration." (Misabeled as "horns of concentration".) After Mellaart.]

The bucrania are not associated with either the vultures (described above) or the figurines (described below), neither here in Anatolia nor anywhere else. Elsewhere, and later, bucrania appear as symbols associated with tombs, as in predynastic mastaba tombs in Egypt (circa 3000 BC), where aurochs horns are, in one instance, placed on the enclosing wall, and elsewhere, as for example, in Sardinia 4000 - 3000 BC, where horns are used to decorate the outsides of rock tombs. Their association with altars is seen in Roman times. The horns were a contemporary image in the sky during the time of Catal Hoyuk, and continued to be seen traveling across the day skies up to 3147 BC.

... hunting deer

There is a fourth mural, depicting the hunting of deer. The iconography of deer herds is out of place, for there were few deer in the vicinity of Catal Hoyuk, and their bones seldom appear in the rubbish heaps. There are more horse bones than deer bones, but horses never appeared in a mural.

It is doubtful that the mural shows humans hunting deer. It is more likely to represent a translation from something seen in the sky as a celestial apparition. The fact that deer are shown might be totally coincidental if the image reflects conditions which had first appeared and been "represented" perhaps thousands of years earlier. At an earlier time, herds of deer might have been the logical simile for large objects traversing the sky periodically or sporadically, not unlike the herds recorded in the caves of Spain and France a few thousand years earlier. Certainly anything seen as animated in the skies would be understood as an extension of what was normally experienced on Earth.

[Image: Catal Hoyuk, Central Anatolia, 7500 to 5700 BC. Mural showing the hunting of deer. After Mellaart.]

I have suggested earlier that these were most likely asteroids in plasma discharge -- in effect a display of comets bunched together in a group traveling with Saturn into the region of the inner planets. Thus the depiction of hunted deer may be an icon from a long ago time when celestial hunters shot celestial lightning bolt arrows at herds of celestial deer. [\[note 20\]](#)

We can be reasonably certain that asteroids were still periodically traversing the Earth's night skies at the time of Catal Hoyuk. Imagery like this, large herds, is shown also on Egyptian predynastic artifacts (knife handles and palettes) and, during the first and second dynasty, the herds were counted and recorded. The deer-hunting scene would make sense as the "appropriate" image for depicting this.

... figurines

Today hundreds of animal, male, and female hand-held sized statues have been found at Catal Hoyuk, most often retrieved from garbage heaps. Because of the strange distortions, many are simply called "humanoid." The distortions are probably the result of seeing Saturn from a changing perspective, or guessing at the earlier shapes of the ball plasmoids seen through the obscuring Absu. In the period during which Catal Hoyuk was occupied, Mars (below Saturn) would have become indistinct within the larger coma of Saturn seen from below. As a result, the figurines became seated rather than standing. The head of a baby being delivered by a few of the figurines is probably Mars seen against the larger coma representing the lower body of the figure seen in the skies. [\[note 21\]](#)

[Image: Catal Hoyuk, Central Anatolia, 7500 to 5700 BC, seated figurine. After Mellaart.]

What is of interest about Catal Hoyuk is that after the period of circa 6700 BC, no male figurines are made. James Mellaart, in his 1967 book *Catal Hoyuk*, mentions a corresponding change in the interior wall decorations, noting, for example that the vultures appear only in the archaeological levels VIII and VII, thus before 6700 BC.

Bleda Düring, of Leiden University, has addressed the transition from the Early Ceramic Neolithic period to the Late Ceramic Neolithic period at Catal Hoyuk, identified as level VIA, which falls in the era of 6700 BC to 6600 BC. This time saw changes in house building and city planning and, as Düring writes, "changes in the ceramics, obsidian industries, figurines and wall paintings." What she writes about the figurines is interesting:

"After Level VI no males are portrayed in the figurines, whereas "large" women occur mainly after this level."

Murals and wall paintings change also.

"... the famous "hunting scene" wall paintings of Catal Hoyuk all date after Level VI [references deleted]. Some older motifs might have been abandoned during the transition; no figurative mouldings later than Level VI are known."

To Düring the changes speak to a cultural transition, but I would also suggest a change in the interpretation of celestial phenomena. The cultural transition might pinpoint the time when the vulture image in the nighttime sky no longer alternated with the dark shaped coma in the daytime skies. Eventually the Saturnian figure would have been seen rotating above the north horizon throughout the year. The transition would have involved attempts at new conceptualization of the being in the skies, and we could expect a change in the iconography at Catal Hoyuk.

There is little certainty to be derived from the dates of artifacts, however, since religious iconography tends to outlast its sources by thousands of years. Initial dates would be more certain. But the cultural change noted by Düring may have involved the influx of new people (as she suggests). The emphasis on depicting only fat women may have been imported. On the other hand, if the cultural change did not involve a large influx of new people from

elsewhere, it is at least of interest that we see the transition in the figurines from male and female to only depicting "large" females at this time. It would indicate a date at which the perspective of Saturn as seen from Earth changed so much that the elongated, standing vulture body became compressed because it was being viewed from further below.

Later Figurines in Anatolia

Increasingly the change in perspective, looking south, but also looking north from Earth below Saturn, would have distorted the "figures" in the sky progressively to become all but unrecognizable. And apparently what we start to see at other locations, is not only a seated lumpy figurine (as at Catal Hoyuk), but ones with strange fleshy appendages in all the wrong places. The Fat Ladies of remote antiquity, the Venus Figurines, have now assumed the amorphous shape of a snowman or a gingerbread woman. Facial features, which were never distinct when Saturn and Uranus were seen from a greater distance, now seem to have disappeared altogether, or the head is entirely missing, except for a long neck. If a face is shown at all, it is wearing a mask. These aspects of the figurines are duplicated by the millions worldwide -- the figurines have become amorphous, misshapen, long-necked, headless or masked, and steatopygic. The ladies are either shown as seated or have huge buttocks and breasts which jut out sideways nearly as much as the buttocks.

As others have pointed out, the first transition from naturalistic to stylized figurines can be placed at about 5600 BC. Only at a later time -- after 4077 BC -- do the figurines become even more stylized, with huge buttocks and breasts, and a spindle for a head. Many are now rendered as flat plaques, perhaps to function as amulets to be worn. They are no longer conceived of as a three-dimensional figure; they no longer even look like a fat woman.

What are we seeing here? It is the flat triple snowball plaque which is especially interesting. My inclination is to suggest that the "snowman" woman represent the triple ball plasmoids seen in the far south. The date of the appearance of the triple snowball plaque, 5600 BC, matches dates at Lepenski Vir, 6500 to 5500 BC (see a previous chapter for details). The dates, however, are not correct if the last of the ball plasmoids was seen before 8347 BC.

With respect to the northern skies, various people throughout the world describe the Saturnian coma as the "chaos before creation." The chaos was called a "swirling cloud" by some people, and "fluffy, like cotton" by others. It is consistently described as turning, but this is not Saturn and its coma turning about itself (which would not have been easily seen), but describes the whole mass turning in a circle about the Earth's north star in the sky.

The "turning in the skies" is almost certain, and not just from the descriptions which come down to us from remote antiquity. The Saturnian "cloud" turned in the skies about the North Pole on a daily basis because it is unlikely that the rotational axis of Earth and Saturn lined up, even with the Earth nearly directly below Saturn.

I had earlier assigned the year 5800 BC or 5600 BC as a milepost in the development of the relationship between Saturn and Earth, first, because of a minor change in climate, minor, but a definite improvement. Secondly, there is a clear change in the depiction of figurines (at least, in Anatolia). It is mainly on the basis of these that I have been willing to assign the arrival of Earth below the south pole of Saturn to about 5800 BC.

The turning of Saturn in a circle about the pole star in the sky perhaps lasted for all of the time that Saturn stood in the skies. We have recollections of this from Mesoamerican and Vedic Indian sources.

What I have attempted to plot in this section are the long-range changes in the image in the skies. It started with the chubby Venus Figurines of 27,000 years ago. These represent a view of the Saturnian planets from afar and seen from a low perspective. After 18,000 years ago the figurines elongate and take on slimmer dimensions. I suspect this is the view at an equatorial level to Saturn. Earth had moved up in its orbit, and the planets were seen in a perspective which revealed the true separation between them. Then, after an initial electric field contact in 10,900 BC, Earth started to lower its position in relation to Saturn, and after 9,000 BC the figurines become foreshortened and again assume the dimensions of a Fat Lady in the sky. As I have suggested, the Earth was also much closer to Saturn at this time than it was 27,000 years ago. After about 7500 BC, as the Earth continued to move closer to the rotational center of Saturn and nearer by moving up, the foreshortening increases again and the figurines were now rendered as Seated Fat Ladies.

By 5600 BC the original form was lost from sight altogether, and the figurines resume their abstract features, but these are likely to have a source in memories. At this time we see this snowman shape, plus the headless long-necked forms. The earlier plasmoids of the southern Peratt Column had become the model for figurines.

By about 5000 or 4500 BC Earth was well below Saturn and perhaps moving up to come closer. In the skies Saturn was now located in the north sky and had increased in size. The image of a woman has completely disappeared, and what is seen instead is a nebulous cloud of constantly moving plasma in glow mode.

Throughout almost all of this very long period the figurines (except for the snow-man figurines) maintain certain features -- the nodding head, the bird mask, the lack of a face, the slit eyes, the nakedness, and the missing feet. But for long periods of time the figurines were perhaps as often shaped by expectations of classical models as by transcription from real life.

Endnotes

Note 1 --

Later Homo erectus, and Neanderthals, and other earlier hominids in Europe develop a method of splitting uniformly sized cutting blades from the edges of a preshaped core of flint (with a flattened top and bottom surface). This method changes very little over 100,000 to 300,000 years. This was a vast improvement over the Homo erectus Acheulean hand axe industry, but it is crude compared to the complete lithic tool-kit of Cro-Magnon or compared to their carefully shaped knives and spearpoints.

[\[return to text\]](#)

Note 2 --

Caves were decorated only at long intervals. For two recently discovered caves, untrampled by modern humans, we have Carbon-14 dates from carbon of fires on the floors and torch relighting sites. Cosquer cave, discovered in 1991, was first entered 27,000 years ago and then not again visited (to add animal murals) until 8500 years later. Chauvet cave, discovered in 1994, was decorated about 31,000 years ago (the Carbon-14 data spans 1500 years) and entered again 4000 years later for an inspection tour.

It should also be noted that the painted areas of the caves (mostly located deep underground) were never used as occupation sites.

[\[return to text\]](#)

Note 3 --

The disappearance of the Cro-Magnon cultures in Europe coincides with the advent of a dry climate in Southern Europe, circa 8000 BC. Climatic conditions after 9000 BC reflected the northward shift of climatic zones due to the start of the Hypsithermal, so that Southern Europe became a desert zone. After 9000 BC there were vastly improved conditions at latitudes further north. But in Northern Europe there are no limestone caves.

[\[return to text\]](#)

Note 4 --

Comparing changes in the philosophy, practice, and iconography of the major religions to the implied "worldview" of Cro-Magnon, you may note that, despite the conservatism of the modern religions, the changes in the last 2000 years far exceed any noticeable change in cave decor, figurines, or even tools among the Cro-Magnon over a period twenty times as long.

[\[return to text\]](#)

Note 5 --

To repeat an endnote from the introductory chapter:

The concept of *subjective consciousness* was developed by Julian Jaynes in *The Origin of Consciousness in the Breakdown of the Bicameral Mind* (1976). *Subjective consciousness*

involves the ability to recognize yourself as seen by others -- an "analog I" -- which is internalized and placed into the space of the imagination. This represented a new mental space, based on a metaphorical displacement of the self, and was not seen in use before about 1000 BC.

You can look through the "eyes" of this "substitute I" or even observe yourself from afar in your mind. Biologically, it involves the functional separation of volition and consciousness in the speech centers of the brain. "Memory" and "self-awareness" do not determine *subjective consciousness*.

Some people never achieve subjective consciousness, yet they appear fully functional. Pre-conscious people are almost indistinguishable from subjectively conscious people. Pre-subjectively-conscious people can learn anything, including mathematics, and certainly they can joke, experience emotions, and carry on convoluted dialogues with each other. However, they rely heavily on the learned admonitions of parents and authority figures ("oughts" and "shoulds") and have difficulty with novel situations.

The concepts are more fully developed in the text. See also the chapter "Language and Causality."

[\[return to text\]](#)

Note 6 --

Dates for the initial drawings in Chauvet Cave, 31,000 ya, span a range of 1500 years. This might represent the variation in Carbon-14 dating, or it may mean that the drawings were in production for a long period.

[\[return to text\]](#)

Note 7 --

Jean Clottes and Jean Courtin, in *The Cave Beneath the Sea: Paleolithic Images at Cosquer* (1996). The quoted statement in the text is about Upper Paleolithic cave art in general. One cave shows reindeer swimming through a river. The river is probably the Absu, introduced earlier in the text. Most figures seen in the skies were likely in glow mode plasma excitement, and would thus be seen through the Absu.

[\[return to text\]](#)

Note 8 --

It has been suggested that most of the caves have eroded and that we have only discovered a small percentage of them. Implicit in this suggestion is that those few caves which have lasted to the present day experienced unusually stable climatological conditions which resulted in preserving images from as long as 31,000 years ago. I doubt this, for although the cool below-ground environment may help to reduce the growth of fungus (which attack the

animal fats used as pigment carriers), it is probably much more significant that the artists used some of the most stable and chemically inert substances: red iron oxide, manganese dioxide, and carbon black. Other colors were mixed from these, with the exception of white, for which a clay was used, and which is also stable.

[\[return to text\]](#)

Note 9 --

Cro-Magnon ranged over Eastern and Western Europe, North Africa, the Black Sea region, and Southwestern Asia, and earlier in Australia. "Cro-Magnon" might be understood as a body type among the great variety of Homo sapiens sapiens.

Note 10 --

The methods of graphic depiction on two-dimensional surfaces in antiquity differs markedly from our practice. Egyptian graphics are based, for example, on rendering recognizable features, with little regard to physical relationships, not unlike Cubism. Thus eyes are shown as seen frontally even though drawn on the profiles of faces. Breasts and nipples are both drawn as seen from the front, resulting in turning the top of the trunk (and the shoulders and arms) sideways from the face in profile. The navel takes an intermediate location, slightly turned away from a profile view, and the legs are again turned back to a side view. That is how humans looked in the overall: all the parts were there.

Sculpture in the round is a very notable exception to this.

[\[return to text\]](#)

Note 11 --

In Mesopotamia, spells, prayers, and magical incantations are certainly of a late date, after 1200 BC. The earlier attitude toward the Gods was one of direct communication on a one-to-one basis.

Egyptian funeral spells date from 2350 BC, and perhaps earlier. The content reflects a great antiquity, but their magical use probably dates to after 1500 BC. The early spells reflect the Egyptian attitude toward language and naming of things as actual, that is, not metaphorical or symbolic.

[\[return to text\]](#)

Note 12 --

Current speculation suggests that the cave paintings are the work of women, since the hand prints which have been found are small. That may just mean that the handprints are of women.

Another twist is the suggestion that the caves were augmented with new images and that images were overpainted and repaired for hundreds of generations.

[\[return to text\]](#)

Note 13 --

James Mellaart *Catal Hoyuk* (1967). Considering the later antics of Mellaart, I cannot quite trust the content of this book.

See [\[www.catalhoyuk.com\]](http://www.catalhoyuk.com) for reports on the current excavation which started in 1993. After 10 years of a multimillion-dollar excavation, the current task force, which is adding buildings, a museum, permanent covers, etc, to the site, has found almost nothing. (See [\[www.catalhoyuk.com/newsletters/index.html\]](http://www.catalhoyuk.com/newsletters/index.html).) Contrary to the claims made in Mellaart's book, it is slowly becoming clear that these people subsisted on plants and domestic sheep, with some goats. Only at a later date are grains (barley and emmer wheat) found at Catal Hoyuk. The domestication of the aurochs has not been proven yet. It looks more like females were culled from wild herds (which was the practice at other locations). Mellaart's suggestion of excarnation as the burial practice is contradicted by the finds, except in a few instances. No particular trading industries have been found, and it looks like the cache of obsidian which was found was imported in finished form. The "deer hunting scene" mural found by Mellaart seems to reflect wishful thinking or a long forgotten tradition, since almost no deer bones have been found. Additional figurines which have been found are crude to the extreme.

Mellaart was lucky in his excavations and may have extended the finds to overly imaginative renderings of the building interiors, which is the practice among archaeologists anyway, although generally more subdued. (Mellaart is from a family of visual artists.) Mellaart also excavated a large area, whereas the current excavators have limited themselves to tiny areas, and only after ten years of digging realized that such methods were not going to find anything on a par with Mellaart's finds.

[\[return to text\]](#)

Note 14 --

Radial spokes have been noted for the planet Saturn. The spokes only show up sporadically in the middle set of rings, and have remained incomprehensible to astronomers. The plasma explanation is that the spokes represent outward directed electric discharges (arcing). Thus spokes could be expected for Earth's rings, since the planet was under continuous electric stresses perhaps since the Paleolithic.

[\[return to text\]](#)

Note 15 --

The vulture image appears on pottery at many unrelated sites throughout the Middle East and Southeastern Europe (Gimbutas). It is probably also identified as the "Thunderbird" of the

North American Indians.

Absolutely huge shapes of birds with spread wings are constructed as mounds at a number of locations in antiquity, as, for example, the mound at San Lorenzo in Veracruz, Mexico, dating to 1450 BC, and at Poverty Point, Louisiana, North America, dated to circa 1350 BC, and as a marked up landscape at Nazca, Peru, dated to about 5000 BC. The two bird mounds face east.

Old World vultures are the largest of birds. At least four (current) species which range in or near the Eastern Mediterranean have wingspans of 9 feet (3 meters). Coloration varies from black to red-brown, but a number of species have white down on their breast. Most vultures also have large distinct flat feet, made for walking. This relates to the human-like feet of the vultures depicted at Catal Hoyuk.

[\[return to text\]](#)

Note 16 --

There is reputed to be another mural which depicts a (horned) person holding two vultures by the neck, one in each hand. I would have suggested that this might appear as an image of Saturn and its companion planets. The image, others have remarked, is reminiscent of much later Sumerian images (circa 2500 BC) of Gilgamesh holding two lions by their necks. (The image is also found in predynastic Egypt.)

However, the horned person image is suspect. It appears only in a much later text by Mellaart, et alii, *The Goddess from Anatolia* (1989). This book was published by a dealer in Anatolian rugs (kilims). The book was not entirely well-received. A scathing critique by Marla Mallett, a professional weaver, appeared in *Oriental Rug Review*, (August/September, 1990), as "A Weaver's View of the Catal Hoyuk Controversy."

[Image: Birdman mural from Mellaart, et alii, *The Goddess from Anatolia* (1989), discussed by Marla Mallett.]

Mallett identifies the horned deity holding the vultures as a "modern kilim pattern of geometricized carnations [which] should be turned upside down." Mallett opens her critique with:

"It is logical to believe that vestiges of deeply rooted prehistoric cult mythology appear

in modern Anatolian kilim imagery. Theories as unorthodox, however, as those presented in the new Mellaart/Hirsch/Balpınar publication, The Goddess from Anatolia, 1989, must endure close scrutiny of all the arguments and evidence. Neither the work's hefty price tag nor its padding with archaeological references and lessons in ancient history ensures credibility. The elegant prose of supporters' reviews should certainly not secure automatic endorsements."

*"Fascinated by archaeological findings at Catal Hoyuk in South Central Turkey, but skeptical because of problems encountered in earlier articles, I was eager to see the new book. It was a shock. I was stunned by stylistic inconsistencies between the Neolithic wall paintings shown in photographs or scale copies, and the new group of 44 "reconstruction" drawings by James Mellaart. Here were elaborately detailed, panoramic works said to be "reconstructed" from fragments, but with no verifying photos. Here were stylistically garbled sketches displaying irreconcilable design concepts. Here, placed alongside modern kilims, were purported copies of their Neolithic counter-parts -- but with warp and weft directions jumbled. From my weaver's perspective, questions of iconography, design diffusion, and historical continuity became incidental. Basic issues needed attention first. Were the drawings credible? Could slit-tapestry weaving actually have occurred in Neolithic Anatolia? Was there proof? Or indeed, **any** evidence of such production?"*

Specifically about the mural of the person holding two vultures, she writes:

"A second conflict is apparent in Mellaart's 1967 comment, 'vultures occur only in levels VIII and VII.' A look at the Goddess 'reconstructions' shows, however, that in the 22 intervening years a plentiful supply of vultures has materialized -- nearly all in paintings supposedly from later shrines, levels VI through II. For example, one much touted motif, a 'deity holding two vultures' (or 'bird carrier'), is from one of the panoramic paintings (Fig. 9) allegedly from Shrine A.III-11. This detail, from an already suspicious work, is the basis for Mr. Mellaart's argument that a common modern kilim pattern of geometricized carnations should be turned upside down and reinterpreted as 'deities with vultures.'"

Mallett notes that the weavers in Anatolia are Turks from Central Asia, not Anatolia. They arrived in Anatolia in the 13th century AD. See [\[www.marlamallett.com/ch.htm\]](http://www.marlamallett.com/ch.htm).

[\[return to text\]](#)

Note 17 --

[Image: Teddy Bear wall sculptures, Catal Hoyuk. After Mellaart.]

The "Teddy Bear" forms might represent the southern plasmoid. These might also represent plasma stream discontinuities of the "stick man" variety.

[\[return to text\]](#)

Note 18 --

Two other instances of these vertical graphics are shown below. The left image was understood as an excarnation scene by Mellaart.

Ladders were in use at Catal Hoyuk for access to the rooftop doorways to the housing.

[Image: Left: Catal Hoyuk excarnation scene, after Mellaart, 1967. Right: Catal Hoyuk, vertical design, after Mellaart, 1967.]

[\[return to text\]](#)

Note 19 --

The Celestial Bull will be identified and named in Mesopotamian legend (the Epic of Gilgamesh) and Egyptian iconography (the Palette of Narmer) as the Bull of Heaven.

Gimbutas has shown some Goddesses of the Neolithic with horns, which she equates with phases of the Moon. But these clearly date from the time when Saturn went nova, after 4077 BC, and long before the Moon showed up near Earth.

The only figure from the much earlier European Upper Paleolithic which is shown with a horn is the Gravettian "Venus of Laussel" (27,000 to 24,000 BC), in Southern France, a naked fat woman holding an ibex horn in her right hand, carved on a rock face. The ibex was widely hunted in Europe.

In Greek and Roman times the bucrania are equated with altars and sacrifices. It had become a symbol of an acceptable sacrifice of a bull to a deity.

[\[return to text\]](#)

Note 20 --

The image is somewhat suspect, in that the "style" does not reflect the blocky, graphic geometric designs used in other murals. It looks more like a cliff-face rendition from the Western Sahara of about the same date or later.

[\[return to text\]](#)

Note 21 --

A seated figurine appeared on the last day of excavation by Mellaart. It shows a grossly fat woman seated with her arms resting on two panthers, and reminded other archaeologists of images of the much later Anatolian Goddess Cybele, who is also associated with wild animals, and depicted in the same manner. The figurine found by Mellaart was headless, but a reconstruction of an upright head with a face and a rolled cap has been added. This figurine has become a cultural icon with "Mother Goddess" worshipers. The authenticity of the reconstruction may not be correct, however. There were few, if any, figurines found at Catal Hoyuk which had heads with which to compare. This is, at any rate, not a form of the typical Venus Figurine (especially for the particular period of Catal Hoyuk). The Cybele figurine probably is exactly what it is suggested to be. The Goddess was current in Anatolia and Canaan at a later date, much after 2300 BC (my estimate), although reputed to be of Neolithic origin. The association with animals suggests that Cybele represents the ball plasmoid of the south, which would have been in view.

[Image: Catal Hoyuk, Central Anatolia, 7400 to 6200 BC. *The Fat Lady with crescent mural*. On the left: a "reconstruction" by James Mellaart, from Mellaart, et alii, *The Goddess from Anatolia* (1989). On the right: a line drawing from Gimbutas, *The Living Goddess* (1999).]

I wanted to use another image with the text of this chapter, a mural, shown above and reproduced in the book by Mellaart *The Goddess from Anatolia* (1989) and by Gimbutas as a line drawing ten years later in *The Living Goddess* (1999).

But I found the iconography curious, and out of style with what I would have expected. It would be the only instance of which I was aware where a crescent is associated with the pubic area of figurines. Although in outline the forms were congruent with figurines of a thousand years later, after 5600 BC, from Southeastern Europe as well as Anatolia (and elsewhere), at the time of Catal Hoyuk, before 6200 BC, figurines worldwide were rendered more or less realistically, not as snowmen.

I later discovered that Marla Mallett, in "An Updated View of the Catal Hoyuk Controversy," in *Oriental Rug Review* (December 1992/January 1993), had also pointed out the suspect nature of this image, which supposedly is derived from room (shrine) AIII-11, although in the 1963 report by Mellaart this room was dismissed as containing only fragments of a hunting scene. To quote Mallett:

"Mellaart has now [1989] claimed that this building had 'some ten successive layers of painting, all differing from each other.' He has not explained this latest contradiction, nor has he told us why such extensive paintings were ignored in the 1963 report."

Recovering the Lost World, A Saturnian Cosmology -- Jno Cook

Chapter 13: The Creation.

\$Revision: 42.41 \$ (polar.php)

Contents of this chapter: [\[Starting from Chaos\]](#) [\[An Unexpected Flood\]](#) [\[The Egg\]](#)
[\[The Creation\]](#) [\[The Eye of Ra\]](#) [\[Petroglyphs\]](#) [\[The City on the Horizon\]](#) [\[Endnotes\]](#)

Starting from Chaos

This chapter will deal with the swirling cloud seen above the north horizon since about 9000 BC when the shadow of the Younger Dryas lifted, the egg in the sky after 4900 BC, the "creation" event of 4077 BC, and the following "Era of the Gods" which lasted to 3147 BC. Some of the material from the previous chapters (which you may have skipped) is repeated here. The dates used in this chapter are developed in more detail in Appendix A, "Notes on Chronology."

By 6000 BC farming was already widespread in Europe, Asia, and Africa, and certainly in the Levant, Mesopotamia, and Egypt, in some cases dating from 9000 BC. An amorphous white shape still stood above Earth in the north, described as "mists" and "swirling clouds." Little was remembered of this period, and thousands of years later the claim is made that, at the beginning, there were no stars and no Sun, and that the stars did not come into being until after the Gods had left, 3000 years later. It was universally held that the past before "creation" was a long period during which the skies were in chaos and featureless turmoil.

In support of a long time during which the Earth was enveloped in clouds and mists, I suggest a perusal of any of the "creation myths" from around the world. These all describe a swirling sky and specify that this condition lasted a very long time. But also a long darkness. The creation myths hold that there was, in effect, no history before the "time of creation."

See especially the work of Dwardu Cardona, in *God Star* (2006), which traces these ideas from diverse mythological sources. Cardona presents descriptions which suggest that the "chaos" consisted of a cloud-like mass floating either in the sky or on an ocean. Associated with this hovering cloud shape was a twisted column of clouds or vapor reaching down to Earth to the north horizon. Cardona notes that this "creation god" was named Hurakan in parts of Central America. He also notes that the episode of darkness and the obscuring clouds are found in a different order among the legends of different people. This is to be expected,

since alternating periods of chaos and darkness, dating back to 10,900 BC, were repeated three times. [\[note 1\]](#)

The placement in time of the obscuring cloud would reflect the location of Earth with respect to the lower plasma expulsion of Saturn. The previous chapter suggested that Earth would have entered the coma of Saturn in 10,900 BC, and from that time moved laterally toward being below the south pole of Saturn. As Earth entered the coma of Saturn, the view of Saturn would have been obscured. Before that time and after 4077 BC, Saturn might have been seen, or, at least, the coma surrounding Saturn would have been seen.

Even after the relocation of Earth to below Saturn, it was not ever exactly below the south pole of Saturn, that is, there was not a single line extending through the axes of rotation of Saturn and Earth. It would probably have taken thousands of years before the spin axis of Earth and Saturn might line up. The reason for this should be obvious: the angle that the central axis of a planet makes with its orbit could point anywhere in the dome of the stars. This is still true today. Thus the axes of two planets would not likely be parallel, and would not coincide. [\[note 2\]](#)

After 10,900 BC, Earth was apparently within the continuous lower glow mode plasma discharge of Saturn, for the later descriptions of a "swirling cloud" in the sky is frequently accompanied by the description of a stream reaching Earth, although this could just as well be the electron streamers from the southern ball plasmoids to the sphere in the north before 8347 BC. If there was an actual plasma contact to Earth, this might have been seen as a blazing fire in contact with the ocean surface in the North Atlantic. Or it could be a simple stream of plasma in glow mode (although likely with a turn to arc mode where the stream concentrated in density).

After 8347 BC the orbit of Earth had become established well below the equator of Saturn (I suspect), and had most likely progressively moved up toward Saturn's south pole. Earth remained in this sub-polar orbit for over 4000 years. A possible indication that Earth was located below Saturn after 8347 BC, is that a warm and moist period started, called the Hypsithermal, which extended through to the end of the "The Age of The Gods," 3147 BC. The improved climate was likely due to a modulation of the Earth's climate by our Sun. [\[note 3\]](#)

I would further suggest that it was a plasma contact from Saturn to Earth which also changed the climate favorably. It might have been intermittent, or happen annually as the column reshaped into stable forms. Or it may also have been entirely due to the warming of the northern hemisphere by the Sun at its higher angle. I do not know, and can only speculate.

But for now let me suggest that a warm and wet climate would result from the periodic (or continuous) plasma contacts with Saturn. This long period of warmth has never been equaled. A plasma arc in contact with the Northern Atlantic would produce stupendous amounts of steam, resulting in the upstreaming of water vapor and the downpour of rain and

snow from above the stratosphere -- adding to the glaciation of Greenland as a result. It would produce worldwide weather conditions unlike anything experienced today. The plasma contact would change the wind direction, increase the moisture, and moderate the climate of Earth everywhere away from the contact. Much later, after the arc ceased, the climate would become colder again. This is, of course, conjecture, and completely contradicts contemporary weather theories. [\[note 4\]](#)

An Unexpected Flood -- 5600 BC

As I have previously pointed out, when the Earth had dropped below the equatorial level of Saturn by about 9000 BC the climatic zones of the northern hemisphere and the tropics changed location, moving north by 10 to 15 degrees of latitude. The tropic zone of Africa moved to the Southern and Central Sahara, and the dry zone moved further north. The climate in Southern Europe, North Africa, and the Middle East worsened between 9600 and 9400 BC (the end of the Younger Dryas), and again from 6200 to 5800 BC, becoming cold and dry. The cold temperatures are open to question, but the lack of rain is certain.

Much of the drop in temperature is today blamed on the release of fresh water into the North Atlantic from the melting North American glacier. The worsened climate affected farmers in the Middle East especially, for there the rains disappeared completely. Nearly all of the Levant was abandoned for periods for up to 400 years. The same drought depopulated large areas of Southern Europe. [\[note 5\]](#)

Along the margins of the Black Sea and its river valleys, however, farming had continued during the drought experienced in Europe and the Levant after 6200 BC, and farming and fishing had concentrated there. The Black Sea region was climatically isolated from the surrounding land areas because it formed a depression 500 feet (150 meters) below the Mediterranean sea level and the adjacent land areas, and even more so because it was ringed on three sides by mountains. The region was thus unaffected by the dry winds from the west and south. The Black Sea was also, at that time, a fresh water lake, unconnected to the Mediterranean, fed by glacial runoff from Northern Europe. The region provided fertile lands in the river valleys and deltas of the Danube, Dneister, Dnieper, and Don rivers on the north margins, and in additional river valleys on the south margins flanking the Anatolian highlands where, incidentally, grains were first domesticated. [\[note 6\]](#)

In circa 5600 BC, the Bosphorus cracked open and the Black Sea was flooded with a fury of Mediterranean salt water dropping 500 feet (150 meters) into the depression, a process mostly completed in a few months. It is likely that externally induced seismic activity caused the Bosphorus to open up. Possibly the gravitational forces exerted by the arrival of Earth underneath Saturn were responsible. Once started, the flooding was unexpectedly rapid, moving miles per day in the low-lying river valleys. Details of this event will be incorporated much later into the story of a worldwide flood by the farmers and fisherman of the Black Sea.

William Ryan and Walter Pitman, in *Noah's Flood* (1998), describe the evidence for the sudden flooding of the Black Sea through the Bosphorus in 5600 BC, and the diaspora of the mixed-farming (farming, hunting, fishing) people to Europe and Central Asia (as well as the spread of Indo-European languages). Europe was largely populated by these farmers fleeing the catastrophic flooding of the Black Sea. By 5400 BC they had reached as far as Paris.

Parts of the initial waves of people spread to Anatolia, the Levant, and Mesopotamia. At least, so it could be assumed. The warmer and moister climate throughout the world after 5800 BC allowed farming to return to the Middle East. This climate also opened up the sub-arctic regions for habitation: Norway, Sweden, Finland, northern Russia, Siberia, Alaska, and northern Canada. Thousands of years later, as the climatic conditions worsened again in the north, we will wonder why so many tribes appear to move south from the far north.

Those who dispersed to Central Asia return on horseback a thousand years later, as the armed Kurgan nomads and herders, and established themselves throughout Europe. After 2000 BC there were additional movements (of Indo-European speakers) from south central Asia into the Middle East (Iran and Anatolia).

The flooding of the Black Sea is well established and well dated. The secondary effect of the flood was the spread of agriculture into Europe and Central Asia with the migration of people away from the Black Sea region. Indo-European languages show up as far east as the western borders of China. An overflow of Indo-European speakers from Central Asia entered India and Persia.

Despite the title of the book by Ryan and Pitman, *Noah's Flood*, this was not Noah's flood. Noah's worldwide flood would happen in 3147 BC, although the Bible will place it in 2349 BC. The Black Sea flood will, however, be the model for many later flood tales, especially in telling how people survived in boats -- loaded, of course, with farm animals, fodder, and seed.

The Egg of Creation -- 4900 BC

By 5800 BC brighter skies had returned, although possibly the Sun was not yet seen regularly. The swirling "cloud" remained, but after 900 years, in about 4900 BC, and at a location surrounding the North Pole of Earth, a circular shape became visible through the swirling clouds, a globe ten or twenty times the diameter of the Moon. [\[note 7\]](#)

The notions of misted skies and of endlessly churning water overhead, which we have from almost all sources, might reflect experiences covering thousands of years.

The globe stood, inactive except for a daily rotation about the North Pole, for another 700 years. The globe looked white. This was the planet Saturn enclosed in a closely held coma of plasma in glow mode. All the tales recall that when God first emerged (700 years later), it

was as a smaller object -- an egg.

Although in some legends of creation only a globe is remembered, other sources recall the figure of a duck or a goose, having noticed the planet Uranus, which was displaced from the central axis of rotation of the Saturnian planets (as noted in the previous chapter). Uranus still looked like the head of a bird -- with a beak and with a neck seemingly connected to the globe of Saturn. Thus any number of creation legends hold that the creator god was a (white) duck or goose. The Egyptian hieroglyph for Ra, the creator God, is a duck. The sacred animal of Brahma, the Vedic creator God, is a goose. As I have noted, from about 5000 BC egg-shape designs are added to pottery decorations in Eastern Europe. [\[note 8\]](#)

In Greek mythology, as in Egyptian mythology, the globe is the original creator God -- Ouranus ("Father Sky") in Greece. Even before the Goose of Creation laid its egg, or before the Egg of Creation hatched, the imagery must have been understood as being alive -- even though nothing much happened for 700 years -- for it moved in a circle around the pole star on a daily basis and additionally the plasma connections would have grown and moved (and changed shape) throughout the year as Saturn moved alternately closer and more distant from the Sun on its orbit. [\[note 9\]](#)

The egg, the real egg, not the body of the duck or goose, might have been Mercury, enclosed in a glow mode plasma, but distinct enough from Saturn to be noticed as a smaller object seen below the duck or next to the duck. With a coma Mercury would have been 10 to 30 times its current diameter.

Creation -- 4077 BC

After the initial period of chaos, and after looking like a duck with an adjacent egg, Saturn went nova and started to blaze like a sun in 4077 BC. Saturn burst into arc mode, threw out an enormous amount of matter, and developed a corona, that is, it lit up like a sun. Initially the globe (egg) seemed to split and light up, and bright circles (rings) appeared at the periphery. The glow mode coma collapsed and disappeared suddenly, as happens in a change from glow mode to arc mode. The mass ejection formed the rings with which Saturn remained marked. Venus was expelled from Saturn and started to revolve around the planets far beyond Saturn's rings. Lightning flashed continuously from Saturn to the rings, as it also still does today.

[Image: A polar alignment of Saturn, Mercury, Mars, and Earth. The relative sizes of the planets are correct, but the distances between the planets are not. Neptune, Uranus, the plasma surrounding these, and the plasma connection to Earth are not shown. Illustration by J. Cook.]

And so the sun was born. It was much smaller than the original white coma which had surrounded Saturn.

In the 16th century Maya *Popol Vuh* the sun rises directly after the darkness of the Younger Dryas ended. To have a newly born sun dispel the darkness makes narrative sense. It is, however, not today's Sun. Even the readers of the ancient source manuscripts recognized that.

"The sun was like a person when he revealed himself. His face was hot, so he dried out the face of the earth."

Seen from Mesoamerica, the "sun" rose no more than about 20 degrees or so above the north horizon. The *Popol Vuh* continues:

"... when the sun had risen just a short distance he was like a person, and his heat was unbearable."

The sun "looked" like a person, with outstretched arms, the rings of Saturn, and a twisted leg reaching down to Earth. The text here suggests that perhaps Earth was relatively close to Saturn initially, and distanced over the next thousand years. The "Sun," as noted, rose only part way.

"Certainly it was not the same sun which we see, it is said in their old tales."

The Aztecs also had a notion that the present Sun seen in the sky was only a mirrored reflection of the actual Sun. The source for this came from the same set of ancient documents. As the *Popol Vuh* claims:

"As they put in the ancient text, 'The visible Sun is not the real one.'"

It was suddenly light during the day and during the night. This constituted the start of a period of continuous light, which some creation myths claim as following the period of darkness. Actually, of course, the considerable darkness of the Younger Dryas was separated from the period of the nova event of Saturn by almost 7000 years of gray skies and overhead chaos. It wasn't dark, but it hadn't been sunny either.

"The name of the water of chaos was Nun. It was from Nun that Ra created himself, rising up on the first piece of land -- the primeval mound (Benben) out of the water lily (lotus) blossom, born from the world egg, or as a /bnw/ bird who then found and landed on the mound."

-- Gary Fletcher, "Zep Tepi," at
www.users.bigpond.com/MSN/gary_fletcher/zeptepi.html

Saturn was now seen clearly in the skies over the northern horizon, as were Venus, Mercury, and Mars, plus their satellites. Uranus would disappear behind Saturn, as Neptune had done earlier. This event was recalled throughout the world as the start of "The Age of the Gods." It was universally held that humanity was witness to this creation event. The year when Saturn lit up can be derived from the Sumerian *King List*, and from the Jewish historian Josephus -- both of which I will detail in a following chapter. [\[note 10\]](#)

The glow mode plasma which had encompassed Earth, now reduced to a single column in arc mode, with a bang. The change to arc mode must have caused a tremendous noise to be heard throughout the world. A late Egyptian source of the Third Kingdom relates:

"Amun initiated creation, in association with his sacred animal, the goose. He is called the Great Honker, who gave a great screech which stirred the inert cosmos into action. He is also called the Great Cackler -- the creative energy in the form of a goose which carried the cosmic egg from which all life emerged."

-- *Ogdoad of Hermopolis*, paraphrased

This is the sound of an electric arc striking, followed by the sounds of a sustained electric discharge. In one of the Egyptian creation epics (as well as a large number of other tales), God creates himself by his own spoken word. Spoken words were capable of great power for the Egyptians. John 1:1 is one of the last evocations of this notion from antiquity. [\[note 11\]](#)

"In the beginning was the Word, and the Word was God."

Another source depicts the creator God in coitus with Mother Earth, penetrating her "fifty times" and eventually moving away, never to lie with her again. Read that as individual arcs, which are as likely as a sustained arc discharge. (This may sum up a thousand years of celestial events.) We see this today (on a larger scale) in pulsar stars -- acting as relaxation oscillators.

David Talbott has traced the sequence of events from Egyptian iconographic and literary sources. At first only a globe shows. At some point the globe splits -- that is, a line forms horizontally across the globe. "The egg cracked," say the records, and goes on to describe the further sequence of events, involving a change in color and a differentiation of the top and bottom half. It is the primordial Yin and Yang of Chinese creation myth. [\[note 12\]](#)

The line which showed when "the egg split" is the first of an equatorial mass expulsion which will create the rings of Saturn. As Saturn now goes nova, the glow mode coma collapses, as I mentioned above, and a smaller sphere, the actual planet in arc mode plasma discharge, appears. Many myths clearly differentiate between the egg form and the blazing planet as if these were two Gods with differing names.

The tale of the egg which splits open along a horizontal line implies that Saturn was initially seen from an angle. With Saturn anywhere "above" the Earth in the northern hemisphere of the sky, this could happen if Earth were not located directly below Saturn, from which vantage point the rings would have looked flatter.

That Earth started out laterally to Saturn, and over an extended period of time was forced to slip lower (that is, to assume an orbit which was further below Saturn and below the orbit of Saturn), is suggested from the description provided by a number of sources. One of these is a section of the Maya *Chilam Balam* books, which notes that Uranus, initially seen above Saturn, "lowered itself into the center" of Saturn (described as a "flower") and that subsequently Saturn lit up like the Sun (see the chapter "The Chilam Balam Books"). The above description from the *Chilam Balam*, about the movement of Saturn and Uranus, represents a changing perspective due to the lateral movement of Earth under Saturn to a more central location. Uranus could, in fact, completely hide behind half the diameter of Saturn. [\[note 13\]](#)

This change in perspective would probably date to well after 4077 BC. It is astounding to think that the predecessors of the Maya (or Olmecs) could have records reaching back that far into prehistory, but the description which I ran across, after already having settled on the movement of Earth during this time, is visually accurate.

The description also suggests that Saturn and the attendant planets -- all five of them -- were in full view at one time, rather than shrouded in mists. But we may also be seeing an extrapolation from earlier sources. We have, at any rate, no similar sequence of events, that I am aware of, from sources in the Eastern Mediterranean. It is also possible that the Maya or Olmecs had a slightly different view of what was happening overhead, not in terms of

perspective, but in terms of the occluding plasma column. This suggests that the "clouded skies" (or at least some of them at various times), were composed mainly of the plasma stream in glow mode from Saturn, and encompassed only a portion of the northern hemisphere, but were not significant below 20 degrees latitude.

That the above description is accurate can be gleaned from additional text of the *Chilam Balam*, which continues with, "His heart was on fire; the Sun was within, and his name could be read." In transcribing information from ancient illustrated glyphic records, the copyist was confusing the illustration with what at a later time would become the glyph for "sun." ("Kin" -- a four-petal daisy form.) Additionally, because the *Chilam Balam* is obviously a radical abbreviation of events, we cannot tell if a thousand years have not lapsed between the start of a sentence and its end. (All punctuation is missing anyway.)

As Saturn lit up, a blazing ball would be seen, with Mercury and Mars in the center as much smaller orbs (but with Mercury still 10 or 20 times larger than Mars because of its coma). Mercury seemed to connect with four plasma streams to "the edges" of Saturn (the number varies over time). These were streams of plasma coming from Saturn far above Mercury and Mars, changing from dark mode to glow mode near Mercury. This continued past Mercury to land at Mars, but as a single stream in arc mode, because Mars did not have a plasmasphere of any significant size, lacking a planetary magnetic field. This last would not have been seen from Earth. This configuration of four streams landing on Mercury, looked from below like a four-petal daisy. This became the glyph for sun, "kin." Thus "his name could be read within."

"The rings of Saturn were known also to the aborigines of America before Columbus discovered the land; this means also before the telescope was invented at the beginning of the seventeenth century. An ancient engraved wooden panel from Mexico shows the family of the planets: one of them is Saturn, easily recognizable by its rings."

"Nor were the Maoris of New Zealand ignorant of them: 'One of the great mysteries connected with Saturn is the still unanswered question of how the ancient Maoris of New Zealand knew about her rings -- for there is evidence that they did have a Saturnian ring legend long before the days of Galileo.'"

-- Immanuel Velikovsky, unpublished document, "ring.txt" at www.varchive.org

Although the Maoris did not arrive in New Zealand (from the Solomon Islands just below the equator) until about AD 1200, in their original homeland north of the equator they had witnessed the birth of God.

In the Maya *Chilam Balam* the equatorial rings of Saturn are seen as the petals of a flower. About Saturn (Oxlahun-ti-ku), the text reads, "The flower was his mat, the flower was his chair."

Some other sources claim that Saturn's rings (as we know them today) were generated later after a cataclysmic contact between Saturn and Jupiter. In the Isis and Osiris story they are the mummy wrapping for the body parts of Osiris gathered by Isis before his body is sent to the underworld.

In its position below Saturn, the Earth now rotated around the Sun below the Sun's equator, so that the Sun continually remained in the northern hemisphere of Earth. Seasonal variation would have been slight, the days long, and, as was recalled at a later time, "fruit ripened all year long." This period, lasting to 3147 BC, constituted what is known as "the Era of the Gods."

The Eye of Ra

Mankind is now met with a gigantic circular shape in the heavens above the North Polar region, encircled in oval rings, with a stream connecting it to Earth. The image reveals Mercury as a white iris with the darker shape of Mars as the pupil of what now looks like an eye staring down from above.

[Image: "Wedjat" -- the Eye of Ra. Source: public domain.]

An image from Egypt, called the "Eye of Ra," captures what was seen in the sky -- Saturn as an eyeball with an iris (Mercury) and pupil (Mars) and with the eyelids and eyebrow defined in almond shaped lines above and below (the rings as seen from below at a slight angle). It is a well-known image, with what looks like a triangular leaf-like form hanging from below the eye, and a feather-like swirl drawn sideways from the lower lid away from the nose, ending in a ball. The plasma discharge from the equatorial region of Saturn (or polar region),

stretching away from Saturn, may have become the line of makeup drawn from the outside corner of the eye across the cheekbones in the later depictions of pharaohs and gods.

[\[note 14\]](#)

Talbott and Thornhill suggested that the leaf-form of the Eye of Ra is Mars with a plasma discharge shaped as a sword or knife. I think, however, that most times Mars was the pupil of the eye. When Mars was close to Saturn it would visually have been reduced to a mere speck. Only after Mars started to lower toward Earth and was displaced from being centered on Saturn, would it look large enough and would it have the triangular tongue shape. The tongue is a plasma of Mars dust pointing to Earth. [\[note 15\]](#)

The pointed plasma outflow extending from Mars may have become the model for the celt -- the polished stone axe -- of Western Europe during the European Neolithic (after 6000 BC) and into the Bronze Age (to 1500 BC). These axes are next to useless for cutting down trees although they would hold their own as maces or bludgeons. Archaeologists call their owners the "battle-axe people," even though we have no evidence of battles. The tomahawk (sagaris) appears in the steppe region of Central Asia much later in the Bronze Age .

[Image: The Narmer Palette of 3050 BC, Egypt. This is a dedicatory cosmetic palette found buried beneath the floor of the temple of the Falcon at Heirakonpolis (Nekhen) in Upper Egypt. The back side is shown. This was at one time thought to represent the unification of predynastic Egypt. After ptahhotep.com.]

The stone celts became "must-have" luxury articles and an index of wealth. A thriving business in the manufacture of very pretty celts developed in late Neolithic England and the polished stone axes are often included in senseless abundance as gifts to the dead among grave goods.

The swirl and ball of the "Eye of Ra" clearly represents Venus, expelled from Saturn at the moment of creation, and still connected with a plume-like swirling plasma stream. This feather-like symbol of Venus is used for the headdress insignia of some of the Gods of Egypt -- as a feather ending in a circular shape at the top. (These might also represent the Earth's polar plumes -- the *axis mundi* -- discussed in the following chapter.)

Alternately, it will become the cobra form (the "uraeus"), always part of the crown of the pharaoh. It is also, of course, represented as the mace with which the pharaoh "smites his enemies," as in the Palette of Narmer dating from 3100 BC, and on labels to grave goods. The "enemy" obviously is Uranus. [\[note 16\]](#)

The image of Venus with a curved plume of plasma extending toward Saturn, also becomes depicted as an ibex with wildly spiraling horns -- at times enclosing an egg, the globe of Saturn -- seen as pottery decoration in Eastern Europe and the Levant, and much later in Scythian ornaments.

[Image: The plow and ibex, carved in a section of the 90-foot tall Grand Menhir at Carnac, 4000 to 5000 BC. The dotted portions continue on other segments of the broken menhir. Source unknown.]

The swirling Venus and its tail may also be the model for that strange Bronze Age personal ornament, the torque. Torques are composed of twisted strands of gold wire with balls at the

ends. They are worn around the neck, just as Venus and its swirl of plasma encircled the head or neck of God in the skies above. We know these primarily from the European Bronze Age of circa 1500 to 800 BC. They may have had an earlier counterpart of organic material.

[\[note 17\]](#)

The two symbols external to the eye -- Venus with its swirl and the hanging sword of Mars (or Uranus) -- also show up early in European iconography as the ibex and the plow (or celt) inscribed on pottery, but also carved on the face of the Grand Menhir at Carnac (dated at 5000 to 4000 BC). The plow more likely may have represented Ursa Minor, with the ibex representing Venus. With Saturn located away from the North Pole location (which was in Ursa Major at that time), the two would have endlessly circled around Saturn during each day and night. [\[note 18\]](#)

To the Egyptians the "Eye of Ra" represents the completeness at the beginning of time -- the "one-ness" at creation. The symbol first appears early in the Old Kingdom. By 1100 BC the constituent parts of the symbol (the corner of the eye, the pupil, the swirl of Venus, etc.) will come to represent a fractional notation ($1/2$, $1/4$, $1/8$, etc.) as the "parts" of the "one-ness." Egyptian mathematics of multiplication and division will remain embedded in a cumbersome fractional notation for the next two thousand years.

What did the Polar Configuration look like to the humans below? Let me first point out that conditions changed continuously, probably even on a seasonal basis. At first Saturn stood blazing like a sun in the sky above the north horizon. But this did not last. It probably diminished to a red glow, or even the aspect of a quiet and cold planet. And if at one time an arc connected Saturn with Earth via Mercury and Mars, this was substituted for with plasma in glow mode, and at various levels and with various effects.

The Polar Configuration

From the vantage point of Egypt or Mesopotamia, Saturn would have represented a blazing globe about 30 degrees up from the northern horizon, with a diameter of about 5 or 10 degrees -- ten to twenty times larger than the Moon. (At a later time, when the Earth had receded from Saturn, the globe in the sky would be much smaller.) A continuous series of eruptions could be seen rising from the edge of the globe. Surrounding the globe there were a number of rings, probably also ablaze. These rings were likely seen as ovals, crossed by lightning flashes, and interrupted by the moving shadow of Saturn. (For the first time in thousands of years the Sun was also seen.) [\[note 19\]](#)

Well outside the rings, to the left of Saturn and "above" (in the standardized image), a white globe hung suspended and attached to Saturn with a swirl of plasma. This was Venus, and would (with its own coma) have had a diameter visually somewhat smaller than the size of the Moon. It is possible that Venus rotated about Saturn in a synchronous orbit and in the same direction as the Earth, so that it would seem to stand still in the skies. [\[note 20\]](#)

Centered on Saturn was a white spot with a dark center. This was Mercury and Mars looking like the iris and pupil of the eye, but in actuality located perhaps a million miles (1,600,000 km) below Saturn and separated from each other. Impinging on Mercury were four (or more) bundles of plasma in arc or glow mode, seemingly from the edges of the Saturnian globe, but in actuality simply coming from the space further above. At times the four bundles would change to three or to five. At other times changes in the electric field surrounding Saturn (due to the Sun) would cause discontinuities in the streams, causing them to look (for example) like a swastika. At times of extreme electric discharge conditions the streams would divide into 14, 28, or even 56 bundles. (These numbers are the standard number of separate bundles of electrons associated with any arc mode plasma outpouring.)

From Mercury the plasma would have continued to Mars. Even if at glow level at Mercury, it would have formed into a tight bundle in arc mode at Mars, since Mars could not produce a plasmasphere of any size much larger than the planet's surface.

Rather than carve a gigantic hole at the top surface of Mars as would be expected of cathode marks, three things seemed to have happened. First, the initial arcing boiled off the upper ocean. With the larger ocean missing, the geographical rotational axis of Mars shifted, bringing adjacent regions to the top. There also seemed to have been enough runoff to fill the smaller ocean, named Deuteronilus.

Astronomers have recognized this last as an almost certain possibility -- there was a disappeared ocean, two, in fact, and Mars has shifted its axis of rotation by 15 degrees.

The next series of contacts created a half dozen fulgamite lightning blisters, which are today called volcanoes, even though they are hundreds of times larger than any volcanoes on Earth, and none has ever produced a lava flow. Certainly these are very strange volcanoes for a planet of only 1/10th the mass of Earth.

Mesoamerican depictions of Mars, although composed of glyphic signs and symbols, recognize the smaller and remaining ocean as a mirror worn by Mars on his forehead. He is also depicted with a torch -- a clear indication that the upper ocean of Mars was sublimating water vapor to space in the 8th and 7th century BC.

The last condition, apparently exhibited during the "Age of the Gods" -- that is, before 3147 BC -- was for a plasma stream in glow mode to simply pass by Mars, probably using clouds of electrified dust. This is graphically demonstrated with the Egyptian White Crown and Red Crown, which represent Mars enclosed in a glow mode plasma stream. The plasma stream continued from below Mars to Earth. The iconography of this condition was explored and presented at the Kronia Conference of 2001 by Talbott and Thornhill.

Originally, and early in the sequence of events after 4077 BC, when Saturn went nova, the plasma stream probably left the lower half of Mars as sporadic discrete arcs, resulting in blistering the lower hemisphere of Mars with thousands on thousands of craters.

On approaching Earth the stream of plasma would have coalesced to a single column or a twisted intertwined column by the Earth's magnetic field, and struck the North Atlantic at the location of the north magnetic pole, where it would have thrown up a stupendous bank of water vapor. The plasma stream thus looked like the stem of a plant, rooted in the Earth, atop a mountain (of steam), with Saturn on top looking like a sunflower.

Periodic changes in the electric conditions exterior to Saturn would cause various discontinuities in the plasma stream, so that at times the stem on which the flower of Saturn was mounted would seem to grow leaves in sets of two at the left and right of the stem. These are flattened toroids, and a common plasma stream discontinuity.

On nearing Earth the stream took a bend to land at the north magnetic pole. The location of the contact point with Earth would remain unmoved for any point of view on Earth, but the portion located 20 or 30 Earth diameters above the Earth, plus all of the stem up to and including Saturn (and its planets), must have looked like it was constantly moving in the wind. The stream looked also like a river connecting Saturn to Earth. Vedic sources call it a swizzle stick, stirring up creation.

The whole apparition, initially separated from Earth by maybe a few million miles (four times as far as the Moon is from Earth today), but eventually at a distance of 3 million miles (5,000,000 km), looked much closer than it was in reality, especially because Saturn was seen relatively low on the horizon. Details of Saturn and Mars could be clearly seen. The satellites of Saturn could be distinguished and seen traveling around the planet, and were counted by a number of peoples as the Gods occupying the upper land while the Saturnian globe was recast as the "land" of the Gods.

The satellites of Mars also could be seen, even though they were quite small, but not until Mars approached Earth (as will be related in the next chapter).

Petroglyphs

The plasma stream connection between Saturn and Earth represented the most impressive display because it showed the most variability and often reshaped itself into geometric patterns, looking like a leafed tree or a puffy beard. I doubt if the stick figure man appeared as part of the northern plasma streams. Neither the *Chilam Balam* nor the *Younger Edda* have references to giants outside of very remote antiquity.

The plasma connection to the Earth looked like a stream of water, entwined snakes, rotating twisted ropes (Birkeland currents), or a circle of bright columns (in arc mode), although this last depended on viewing from a select perspective in northwestern Europe. In the nature of a plasma stream, it was always alive, always changing, although it could be expected that the various forms would take months to form. As the flow of current varied, it assumed many different shapes, looking at times like a stairway or even a set of stepped arrowheads.

The "stairway" form and the related "arrowhead" form have been observed in experimental discharges (lasting only milliseconds) but can reliably be scaled up in size and extended to much longer periods of time. The images show up in myths (and in petroglyphs) on all the continents. The plasma stream connected to Earth at the magnetic pole, not at the geographical North Pole. Where the plasma stream touched Earth a gigantic cloudbank arose in the North Atlantic and enormous auroras played at the edges. Thus it looked like a tree rooted on a mountain at the Earth, but swayed away from this location further away from Earth. [\[note 21\]](#)

The differing shapes were due to instabilities lasting for months and were probably only infrequently identical. The instabilities were caused by the changing response of Saturn to the Sun's electric field as Saturn moved closer to the Sun and further away again over the year. (Saturn and the Earth were most likely on elliptical orbits.) The plasma stream from Saturn probably represented 1,000 million amperes and may have delivered fifty trillion kilowatts per second for 7000 years. [\[note 22\]](#)

A plasma instability is a deformation of the plasma stream, which otherwise has the simple form of a conduit. In arc mode the conduit might consist of a circular bundle of continuous electric arcs. An instability looks like a shockwave traveling through the bundles, deforming the stream into a series of stacked toroids or a number of other forms.

An instability results from a change in the current level being carried by the plasma stream. This would occur as Saturn moved further away from the Sun and back, as would happen on an elliptical orbit around the Sun. In the case of the southern "Peratt Column" plasma stream, an instability might last for months (as suggested by Peratt). Certainly this gave the petroglyph artists plenty of time to execute a design.

The millions of petroglyphs -- some of very complex shapes -- throughout the world, initially carved after 10,900 BC to depict the southern Peratt Column, might have been augmented with the views of the plasma column in the north. Or not. The new entity in the north did not require a vantage point high up on a cliff face. Unlike the southern plasmoids which were difficult to see above the equator, and kept disappearing below the horizon, the northern apparition was easily seen by almost everyone -- at least north of 10 degrees south latitude. As a result far fewer petroglyphs can be attributed to a northerly view. There would have been little reason to draw pictures to bring back what had disappeared.

Petroglyphs have a remarkable identity over such diverse areas as the Southwestern United States, Northern Europe, Saharan Africa, Asia, and Australia. Although the rock carvings had long been identified with the plasma discharge of Saturn by Talbott and others, the involvement of Anthony Peratt with the Saturnians of Thunderbolts.info eventually allowed clear identification of the images. Peratt's team has, since his first contact with the Saturnians, investigated some 4,000,000 petroglyphs from worldwide sources and claims about half of the petroglyphs do not represent any known imagery except plasma instabilities.

We should be able to distinguish between the plasma contact in arc mode and in glow mode. The contact with Earth probably started in glow mode, and seems to have lasted a very long time. Only after 4077 BC would the column have switched to arc mode. The circular pattern of 56 columns of the electron beams are replicated in the construction of henges in England near the contact point with the north magnetic pole.

We have no idea of how long the arc of 4077 BC lasted, although it may have been hundreds of years. Perhaps the current density decreased progressively over time as the electrostatic depletion of Earth increased in time and Earth relocated further from Saturn. As the current density decreased, at some point the plasma stream switched from arc mode to glow mode. The Maya *Book of Chilam Balam*, written in Colonial times, notes the order of events:

"Then it was that fire descended, then the rope descended, then rocks and trees descended."

In low-level arc mode and high-level glow mode it took the form of a twisted rope. The "rocks and trees" are plasma stream instabilities of the displays in glow mode.

High-density plasma streams tend to separate out into 28 or 56 bundles (this is even seen at galactic levels). In higher-amperage arc mode a section of the stream can take the shape of lighted bundles arranged in a circle, especially noted in the construction of henges of northwestern Europe, which consistently replicate the 56 bundles in their designs. The builders were located close to the earthly contact point, and had a point of view which looked directly up along the axial alignment of the plasma stream as it bent away from the north magnetic pole. The same count of 56 separate bundles of the arc are represented in petroglyphs worldwide. Once you catch sight of the core of the electron beams in arc mode, anything beyond disappears from view. It is the 56 brilliant dots which then become the apparent source of the plasma -- rather than a view of Saturn.

The arc to Earth might also have extinguished and restarted again, with a sustained connection in glow mode during the intermediate intervals. I'll suggest in a later chapter that the re-ignition of the plasma in arc mode was understood in Mesopotamia as the heavenly assignment of new rulers of Earth.

A common view from locations on Earth far removed from the North Atlantic contact point, show the shape assumed by the plasma stream as a shaft with a series of seven or nine disks, initiated as toroids (doughnut-shaped rings) which flattened out and turned up at their outer edges.

These are the leaves of the tree on which Saturn was mounted. The "tree" form shows up in early Mesopotamian seals and sculptures, as the "pillar of heaven" or the leafed "tree of heaven" surmounted with a globe. These were also the seven heavens of the Bible and Chinese mythology and the *djed* pillar of Egypt (with only three disks). The steps to heaven are reflected in the design of stepped pyramids in Egypt, Mesopotamia, and Mesoamerica,

and in Chinese pagodas. However, the look of the Absu or Duat, with its seven rings (as seen at about 30 degrees north latitude), and periodically looking like seven stair steps in the east and in the west, when the shadow of the Earth extended across all of the Absu, might represent a more solid basis for the "stairs to heaven." [\[note 23\]](#)

The interpretation of the display in the sky in antiquity depended in part on the viewing perspective of people at differing latitudes on Earth, and how close they were to the termination of the plasma stream where it made contact with Earth. But there were many common elements. It is the snake which will gnaw at the roots of the tree to bring down Valhalla, and the snake which nests in the Sumerian Goddess Inanna's Huluppu tree. It is the entwined serpent-necked animals of the Palette of Narmer (called "serpopards"). It is the Peach tree of Chinese mythology, seen in the northwest.

To the people living much further north than the Mediterranean, the contact of the plasma stream near Earth would have looked different. The Eddas describe the plasma stream as the bridge Bifrost between Earth (Midgard) and the "Other World" (Asgard). North of the plasma contact point in the Atlantic, the stream would have looked like an arch spanning the heavens from a location in the southwest to Saturn seen almost directly overhead.

Some Norse legends call the stream an "inverted tree" with the roots at the top and branching near the Earth. This is very probable because, on hitting the cloudbank above the contact point, or perhaps even on hitting the atmosphere, the plasma stream might have broken up into separate strings -- not unlike lightning. [\[note 24\]](#)

The plasma stream from the heavens was accompanied by endless celestial noise as the Earth's atmosphere and crust produced a calliope of sounds in feedback to vibrations from the column. "The Gods taught us music," people will later declare. Chinese legends hold that music derives from thunder.

The Egyptians used the distinctly different shapes assumed by the plasma column as the shapes of a number of hieroglyphs. These are first seen on pottery fragments before 3000 BC (identified as such by Talbot). [\[note 25\]](#)

As Talbott has pointed out, the "bowling pin" shape of the White Crown of Upper Egypt and the Red Crown of Lower Egypt were suggested also by the descent of Mars within a plasma stream in glow mode (discussed in the next chapter). Both shapes represent the pharaoh's head as Mars, with the widened bulbous plasma stream crowning his head, especially prominent where it widened to surround Mars. The White Crown is the stream in daylight, with Mars hidden completely in the white glow-level plasma which is lit from the front by the Sun. The Red Crown is Mars seen at night, with the sunlight from behind making the red globe visible. As the Sun shines from an angle, a shadow falls on the column. This is the peculiar cutout in the Red Crown.

The City on the Horizon

During the time of the arc mode connection with Earth, where the arc met the salt water of the North Atlantic, water was turned to steam in large quantities. This mass of steam must have risen up well past the stratosphere (helped perhaps by the tidal pull of Saturn at the pole) and been forced to spread away as more steam and clouds were generated beneath it. Here it cooled and fell back as snow.

But the cloudbank composed of water vapor was of much smaller dimension than the "cloudbank" seen as a mountain by people in Egypt, Sumer, and China. This other "cloudbank," seen from afar, was a dome of plasma -- the bell-shaped bottom portion assumed by the plasma stream under certain instability conditions.

One of the semi-stable forms of the plasma stream is a series of three toroids. The center toroid flattens out to become just a cross bar. The top and bottom toroid develop bell shapes, facing up and down. This chalice form becomes the Holy Grail of Arthurian tales. The lower portion would have looked like a steep bell-shaped mountain and would have been seen from very far away.

This plasma "cloudbank" or "world mountain" may be seen today in the stupas of India or the "omphalos" (a "navel" connecting Earth to heaven) of Delphi and other sacred locations in antiquity. The plasma dome at the horizon likely rose up thousands of miles. Eventually the giant aurora or vaporous plasma might have covered perhaps 30 degrees of the circumference of the Earth. It would have been visible from 10,000 miles (16,000 km) away -- nearly half the circumference of the Earth. [\[note 26\]](#)

The upper portion, when seen in outline, where the edges of the plasma was most dense, will be recognized as the *Ankh* held by the pharaohs, or as the cartouche of Egyptian hieroglyphics, and as a similar device held by the God depicted in Sumerian seals. There are other later sources for this image, however. [\[note 27\]](#)

Along the edges of the cloud bank or auroras, fluted areas must have developed, as is typical of auroras, and would show in relief in sunlight. Such a continuously generated figure standing up to the high heavens, surrounding the strike point of the arc, must have looked like the walled cities described in Sumer, and the primordial mound of creation described by the Egyptians. Numerous records recall the "cloudbank," as it built up and broadened, as the City of the Gods. In later ages it is claimed that the Gods showed mankind how to build walled cities and temple enclosures. [\[note 28\]](#)

"The great gods created the structure of Unug, the handiwork of the gods, and of E-ana, the house lowered down from heaven. You watch over the great rampart, the rampart which An founded," (one manuscript has instead: *"its great rampart, a cloudbank resting on the earth"*), and continues, *"the majestic residence which An established."*

-- *Gilgamesh and Aga*, Sumerian, circa 2800 BC

The quotation above is from one of the Gilgamesh sagas. The "majestic residence" described here is actually the E-ana, the name of the temple of An at Uruk. "An" is the primary creation God. A connection is here made between the founding of the celestial city *before* the flood of 3147 BC to the city walls of Uruk (Unug), built 300 years *after* the flood -- as if they were interchangeable. The address, "You watch," is in reference to Gilgamesh waiting, at the city walls of Uruk, for the approach of King Aga of the city of Kish.

Mastabas in Egypt and China, with their exterior buttresses or regular indentations, recall the giant mountainous shape near the pole. In Egypt this kind of wall, enclosing pyramids and temple compounds, is today called the "palace wall facade." Even common house walls in Iran during this period have regular exterior recesses which seem to have no structural function. [\[note 29\]](#)

China also records a giant mountain in the northwest which supported the Celestial Peach Tree. In China the "cloudbank" is also interpreted as the shell of a tortoise which supports Earth -- where "Earth" is understood as Heaven. Central and South America see the plasma "cloudbank" as a mountain of caves -- from which the first humans came. [\[note 30\]](#)

Along the coast of Western Europe, the bell-shaped plasma instability might have been only a slight mist to the tribes looking out on the North Atlantic, and only the much smaller water vapor cloudbank, composed of steam from the sea, would have been seen. The Western Europeans had a clear view of this local mass of expanding steam clouds, and above-ground megalithic "barrow graves" are built after 3800 BC in imitation of the furrowed water vapor shape at the northwestern horizon. Beside the overall shape of a pudding, the grave barrows of Ireland and England frequently also have regular indentations at the exterior edges. Barrow graves proliferated along the Irish and English coasts, and are found from Portugal through Scandinavia. Fewer are found further east into Europe. The cloudbank of water vapor certainly was seen as an apparition of substance -- the fortress of Ys floating on the ocean, as was later recalled by the coastal people. The earlier huge barrow graves, dating to 4000 BC, uncrenelated and oriented north-south, probably recall the ball plasmoids seen in the far south toward which all the traffic on the electron beams was moving. [\[note 31\]](#)

Endnotes

Note 1 --

"Hurakan," is the name in Central America for the Peratt column ball plasmoids in the south. This becomes clear from the *Popol Vuh* and other Mesoamerican sources. *God Star* was published in 2006, a year before Peratt's revelation of the plasmoids seen in the south.

[\[return to text\]](#)

Note 2 --

The fact that at the earliest time after 4077 BC Saturn in effect reappeared out of the northern ocean on a daily basis is mostly confirmed from the name "Heart of Sea, Heart of Lake" in the *Popol Vuh*. The northern ocean might be the Caribbean, as seen from northern South America, or the Pacific as seen from Ecuador, at a time before the predecessors of the Olmecs had migrated to Central America. See the chapter "The Popol Vuh." The "lake," at any rate, is as likely the rings of Saturn, seen from below or at an angle. These were not likely seen in direct sunlight, but only when backlighted at night. Saturn itself also would disappear in the day (as does the unlighted face of the Moon today) except for the lighted crescent.

[\[return to text\]](#)

Note 3 --

The Hypsithermal, a period of warmer climate throughout the world from about 9000 BC to 2500 BC, is subdivided into additional smaller periods. The "climatic optimum" from about 5800 BC to 3000 BC is one of these periods. Because the Earth's orbit was at that time placed entirely below the level of the Sun, the inclination of the Earth's axis to the Sun added to the improved climate in the northern hemisphere.

[\[return to text\]](#)

Note 4 --

Traditional thinking is that cold winds sweeping off the continental glaciers (like the North American Laurentide Ice Sheet) condensed water vapor to rains on meeting the warmer zone south of the glaciers (as in England and Europe). This is an attempt to explain the unexpectedly temperate climate south of the glaciers. But cold winds do not carry moisture.

Traditional geological and climatological estimates are based on contemporary conditions, and do not consider an alternate orbit for Earth, with the Sun at a different angle, or the effects of a plasma contact. The overall operation of a global weather system under the condition of a multi-billion ampere arc in the North Atlantic is outside of our current experience.

[\[return to text\]](#)

Note 5 --

The two worsenings of climate in the Middle East (where we have reasonable records) suggest that the plasma contact with Saturn was not continuous, but was interrupted during these periods. Only after 5800 BC does the plasma contact remain, eventually going to arc mode. On the other hand, the northward relocation of the dry zone north of the tropics would be enough to account for the radical change in climate in the Middle East (as well as Southern Europe).

A change in the location of a climatic zone probably might take a hundred years before having an effect which would be noticed by archaeologists.

[\[return to text\]](#)

Note 6 --

The cultivation of grain apparently spread through all of the Black Sea basin during the period of 6200 to 5600 BC. After 5600 BC, it was the Black Sea basin which becomes the source of the spread of agriculture to Eastern Europe and, within another 200 years, to Western Europe.

[\[return to text\]](#)

Note 7 --

In terms of an image, if the globe of Saturn subtended 10 degrees in the sky (a measure sourced from Talbott, perhaps from his analysis of the perspective of some images), it would be located at a distance of $(71600) * \cos(10) / \sin(10) = 406,064 \text{ miles (654,000 km)}$. This seems much too close with the possibility of destructive tectonic results -- such as the Black Sea flood of 5600 BC where the Bosphorus opened up. For comparison, the distance to the Moon is $(2160) * \cos(.5) / \sin(.5) = 247,511 \text{ miles (398,000 km)}$.

[Image: distance to Saturn, based on a 10-degree angle of view. Illustration by J. Cook.]

These calculations are based on Saturn being the same diameter as today, and there is little reason to suggest a change in size. Ten degrees is 20 times the diameter of the Moon today -- equivalent to two hand spans at arm's length. Thus the "globe above," would have been immense.

But the initial circular shape most likely was the coma of Saturn, which would have been much larger than the physical size of Saturn. Using a multiplier of 20, the distance between Earth and Saturn would be $20 * (71600) * \cos(10) / \sin(10) = 8,121,000 \text{ miles (13,000,000 km)}$.

My later estimates of the distance between Saturn and Earth (in "bare" form, as in arc mode

discharge) are 2.83 and 2.75 million miles (both developed in Appendix B, "The Celestial Mechanics"). This would represent a subtended angle of 1.5 degrees (for the actual planet), still three times the width of the Moon today.

At any rate, seen from any latitude north of the equator, Saturn would appear on a location in the sky surrounding the Pole Star. The amount Saturn might be off from this exact location of the pole star, as seen at various latitudes, would be slight if the axis of the two planets coincided. But as has been stated previously, the spin axes of Saturn and Earth would not have had any reason to be aligned initially, and would only subsequently become closer aligned. Thus the apparition could be seen from perhaps 10 or 15 degrees of latitude below the Earth's equator because it rotated around the position of the Earth's polar axis. The "day" would thus also have been determined by the apparent circling of the giant orb about the North Pole. This movement, especially after Saturn went nova, is described in Mesoamerican Michoacan creation myths. Mexicans still play a football game with a flaming ball.

"The ancient sun was a huge celestial orb batted about by the dark, unpredictable powers of the cosmos"

-- Bernardino Verastique *Michoacan and Eden* (2000)

[\[return to text\]](#)

Note 8 --

The egg designs could be Jupiter when Saturn's orbit fell inside Jupiter's. Jupiter, in fact, seen lighted by the Sun, but seen from below, would have looked oval shaped.

There is an obvious problem for both mythology and modeled artifacts, namely the fact that there are no references to the fact that the image of the duck or goose may have turned during the course of a day -- so that an upside down duck would show at some point. This can only suggest that the Earth and Saturn rotated at the same speed, probably the 24-hour day we experience today or something close to it. That the day of Earth remained mostly the same for 8000 years can be suspected from the fact that the orbit of Earth never changed radically.

To suggest that the day of Saturn changed from 24 hours to 11 hours after 3147 BC, when Saturn moved to a far greater orbit around the Sun, is also not unreasonable if this is understood as an exchange of spin momentum for orbital momentum.

The rotation of Saturn around itself has nothing to do with how it would be viewed from Earth located below its south pole, since Saturn is a sphere, and differential rotation would not affect the view from Earth. What we are concerned with here is the fact that, to have the apparition constantly look like a duck or a goose, Uranus would have to be visually seen above Saturn.

Last, considering the distance between Earth and Saturn, Uranus would not have disappeared

behind Saturn for any part of Earth's daily rotation -- at least not during the first few thousand years. The view also would not change significantly with different latitudes of Earth.

There are actually some indications that Uranus might have been seen in different locations with respect to the globe of Saturn. The Egyptian Palette of Narmer (circa 3050 BC) depicts Uranus as a long-haired captive on the lower right from the pharaoh (who represents Saturn and Horus). The Egyptian icon called the "Eye of Ra" is another image which seems to place Uranus "below" Saturn. See the text for details.

[\[return to text\]](#)

Note 9 --

"How things look," or what they seemed to look like, is an abstract mental concept, strongly influenced by habit, and thus by cultural transmission. Once an identification is made, it will remain, despite changes. Cultural transmission of "what things look like" can be seen in the concept of what is seen in the face of the Moon. China and Mesoamerica hold that the Moon represents an image of a rabbit holding a book. Western Europe takes it to be the face of a person.

[\[return to text\]](#)

Note 10 --

The "mythology" of Mesopotamia is similar to that of Egypt, India, China, and Mesoamerica, plus hundreds of other nations and peoples. The hundreds of additional stories, retellings, and legends from around the world all consistently include the same elements.

From India:

"As stated in the Puranas, there was only water all over at the dawn of creation. This water gradually began to circumambulate in a circular motion, which in turn produced bubbling foams. Besides, one kind of white element emanated from the water out of which the creator created an egg. This egg bisects into two parts and the Brahmma appeared out of this egg from where the name Brahmanda or the Universe is derived. One part of this broken egg constituted the earth and the other space. According to the Purana, the tiny parts that scattered all over at the time of bursting of the egg produced rains."

Following is a paraphrase of part of the first verse of the Finnish *Kalevala*, transcribed from verbal recollections and ballads in the 18th and 19th century AD.

"Ilmatar, the virgin of the air, leaves the loneliness of the sky and moves down to the sea, where the wind impregnates her. She drifts upon the waters for 700 years."

*Overburdened now the maiden
Cannot rise above the surface;
Seven hundred years she wandered*

*Thus she swam as water-mother,
Toward the east, and also southward,
Toward the west, and also northward;*

"... pregnant but unable to give birth. A duck flies by and lays several [seven] eggs on Ilmatar's upraised knee. As the bird sits brooding in the nest, the heat makes Ilmatar jerk her knee, and the eggs begin to change. One breaks open and the lower half becomes the earth, the upper part becomes the sky, the yolk becomes the Sun, and the white becomes the Moon."

The two halves of the egg are used in the same way in the Indian Puranas and the Finnish Kalevala. Ilmatar's pregnancy results in a son who will initiate creation. It is also clear that the initial lines retell the travels of Saturn from the overhead skies "down" to the ocean in the vicinity of the Big Bear.

The rotation of Ilmatar in the ocean is in a clockwise direction -- east, south, west, north. This would be as seen from below the pole star. However, the stars near the pole star rotate (or seem to rotate) in the opposite direction. As seen from anywhere on Earth, with the Earth rotating to the east, Saturn would be seen following the same path as the fixed stars about the North Pole star -- counterclockwise. Ilmatar would be rotating counterclockwise only if "south" meant the direction "up" and over.

The Kalevala has Ilmatar wandering of 700 years, which I also derived from the Mesopotamian King list (see a following chapter).

People more than ten degrees in latitude below the equator would not have seen the birth of the "Sun," but would certainly have experienced the light. Michael Witzel, in "Vala and Iwato, The Myth of the Hidden Sun in India, Japan, and Beyond" at the *Electronic Journal of Vedic Studies* Volume 12 (2005), notes for the myths of the birth of the Sun:

"The myth relates the disappearance of the sun (or the deity of the sun) in a cave or some other enclosure, and its re-appearance (often as Dawn) after the intervention of a group of gods (and others), creating (or restoring) light and prosperity to the world."

"It is found in various forms in Vedic Indian, Greek, Japanese, Ainu, Amerindian and South-East Asian sources, and in an aberrant version even with the Hawaiians."

"... in the light of the theory of a Eurasian (Laurasian) mythology, its distribution is significant. The myth is found precisely in the areas labeled as Laurasian, irrespective of geographical distance from the pole or equator, but not in Australia and sub Saharan

Africa. Also, the structure of this myth is very similar in all the versions mentioned above."

Witzel mentions that the Inca, although living below the equator, participated in this Eurasian myth.

[\[return to text\]](#)

Note 11 --

The goose form seen in the sky, which was seen as a body with a neck and head, occurs in the fairy tale of the Golden Goose. The bird of creation is universally understood to be a duck or a goose because the coma was white.

From Hindu myths we have the following, quoted by Kelley L. Ross, and with his added comments:

"The eternal ones, Brahmâ, Hari, and Shambhu approached him, each mounted on his own vehicle: [The sacred animals of the Gods] the bull Nandi for Shiva, the eagle Garud.a for Vis.n.u, and a goose for Brahmâ.

-- Wendy Doniger O'Flaherty *Hindu Myths* (1975)

Ross notes, "There is a more dignified vehicle for Brahmâ, however, the lotus." Kelley L. Ross, at www.friesian.com. The lotus will be recognized as the outpouring of an equatorial disk, which constitute the rings of Saturn. The same lotus is the seat of the "Companions of Osiris," the four large satellites of Saturn, in Egyptian funeral practices.

[\[return to text\]](#)

Note 12 --

In Talbott's imagery, the rings of Saturn are missing and Venus is placed below Saturn, between Saturn and Mars. See David Talbott, *Symbols of an Alien Sky* (program for a slide presentation, 1997).

[\[return to text\]](#)

Note 13 --

With Earth directly below Saturn, Uranus would disappear from view, since it has a diameter of 51,000 km, and Saturn's radius, half of which would hide Uranus, is 60,000 km. It just fits.

[\[return to text\]](#)

Note 14 --

The Eye of Ra is the only image of which I am aware that actually attempts to represent some sort of extension of the rings, or beyond the rings, into the space away from the Sun. The

rings could not take this shape, however, since the rings could not be altered without rapidly being lost. The "eye" -- and later a removed and traveling eye -- is a constant in both Egyptian and Chinese sources, and elsewhere.

[\[return to text\]](#)

Note 15 --

A circle with a dot (or small circle) in the center (representing the darker Mars in front of the globe of Saturn) was the hieroglyph for "sun" in Egypt (the God Ra) and the glyph for "sun" in China, and is still in use today as the symbol for the Sun in astronomy. The Maya use a four-petaled flower as the glyph for Sun -- a larger circle with a small circle at the center. The edges of the petals represent four (or more) streams of electrons in arc mode to Saturn from Mercury, but seeming to converge from Saturn to Mercury.

A later depiction of Mars, among the Aztecs, shows Mars with its tongue extended down from the jaw (as, for example, in the center of the giant "calendar stone"). This is probably a correct depiction of a plasma flow (of positively charged dust) which extended only some distance below Mars. The *Chilam Balam* likewise records Mars in this manner:

"Then it was that the word of Bolon Dzacab [Mars] descended to the tip of his tongue."

[\[return to text\]](#)

Note 16 --

There are obviously problems with the iconography of the Eye of Ra, for the rotation of Venus around Saturn will change direction depending on whether a left or right eye is depicted. Shown as a right eye, Saturn would appear to be rotating correctly in a clockwise direction as seen from below. The right eye of Ra is thus probably the original. But in both cases Venus is seen rotating about itself in a direction opposite to the rotation of Saturn. The tradition is that the Eye of Ra is the left eye.

[\[return to text\]](#)

Note 17 --

The description of a figure called the "Ancient of Days" in the *Zohar* of the literature of the *Kabbalah* (13th century AD) is obviously derived from the Saturnian polar imagery. It is a head, or multiple heads (skulls), with or within a strong light source, a beard, no body, but with testicles and a penis which exudes some magical liquid equated to the dew source of manna during the time of Moses. There is also "a strong right arm," which has to represent Venus with its swirl connection to Saturn and seen on the left. The "strong right arm" also suggests that Venus was stationary as seen from Earth, that is, it revolved around Saturn in an Earth day.

The *Kabbalah* dates from about 200 BC and is a mystical reaction to the more staid

mainstream theology of Israel since 500 BC. The *Zohar* was written in Spain in the 13th century AD, in badly done Aramaic (including Spanish words). Although possibly based on the Egyptian image of the Eye of Ra, it more likely represents a Celtic oral tradition.

[\[return to text\]](#)

Note 18 --

The images of a plow and ibex also occur on ivory talismans found in Northern Mesopotamia and dated to shortly after 3147 BC.

If the Grand Menhir dates as far back as 5000 BC, then Saturn would have gone nova earlier than my estimate of 4077 BC. Its main breakage point of the Grand Menhir is one third up from the ground, typical of a cantilevered upright beam. The bottom section was shoved in the opposite direction. One section was removed and used in antiquity in the construction of a giant mound nearby. Some hold that it was purposely toppled.

[Image: Grand Menhir of Carnac. After megalithia.com.]

The Maya *Chilam Balam* reads, "First the fire, then the rope," but gives no indication of dates. After the "rope" (a plasma stream in glow mode) changed to dark mode (as can be suspected) nothing would be seen, and in fact the shape of Saturn, except for the crescent lit by the Sun, would disappear almost entirely when seen against the daytime sky. At night, seen from the night-side of Earth, its outline would be fully lighted by the Sun, plus a rotating crescent.

[\[return to text\]](#)

Note 19 --

By 3147 BC Saturn subtended an arc of only about 5 degrees, if we go by the later depiction of the White Crown of Egypt, which looks like a bowling pin, with Mars (enclosed in a glow mode plasma) forming the wider part of the crown and Saturn forming the upper knob. The calculated distances between the planets in 3147 BC suggests the same (see Appendix B).

[\[return to text\]](#)

Note 20 --

The Maya *Popol Vuh* has a different reading on the two planets seen with Saturn, seen much earlier, calling Venus and Uranus a mattock and hoe. These are placed in the ground by Hunahpu and Xbalanque when they arrive to cultivate their "garden patch." They also place an axe in a tree trunk. From my later text:

The gardening implements proceed to cultivate the ground by themselves while the boys go hunting. ... As I have pointed out, this implies a rotation, or at least a rocking of the Saturnian polar configuration as seen from Earth -- not the rotation of the planet itself, but the rotation of Saturn about the North Pole, so that Venus, the stone, and Uranus, the wood, would also rotate. These two might easily pass for a mattock and hoe.

I cannot place the axe, unless that is Mars.

[\[return to text\]](#)

Note 21 --

The plasma connection would show as twisted ropes only in low-level glow mode. As the current increases on approaching arc level, the plasma starts to look more like a solid column. In arc mode the column would divide up into a circle of 28 or 56 separate very bright streams, at times arranged as two concentric circles of these bundles.

Anthony Peratt, in "Characteristics for the Occurrence of a High-Current, Z-Pinch Aurora as recorded in Antiquity," (Institute of Electrical and Electronics Engineers, *Transactions on Plasma Science*, December 2003), discusses the large number of petroglyphs found worldwide. For the casual reader, this is high obfuscation typical of journal papers. Most of the tie to reality is with respect to current auroral phenomena. Peratt divides the plasma stream up into three sections, and discusses two of them. The lower section, where contact would have been made to Earth, is not discussed.

In a second paper, "Characteristics for the Occurrence of a High-Current Z-Pinch Aurora as Recorded in Antiquity Part II: Directionality and Source" in *IEEE Transactions on Plasma Science* (August 2007), Peratt gives the fact that half of the petroglyphs which can be identified were created in locations with an unobstructed view of the south. A suggestion is made that the aurora should have encircled the magnetic pole, but it did not. From his research he also concludes that nothing like the south polar plasma column was seen in the north -- or at least it did not require access to high cliffs to make a record. A view of the southern ball plasmoids required a view past the equatorial bulge of the Earth. See the chapter "The Peratt Column."

After the Peratt Column disappeared in the south in 8347 BC, a new column started up from the north, which went to arc mode in 4077 BC (my estimate, based on Josephus). This second column would be subject to most of the same changes in form that the Peratt Column

in the south had experienced, but there would be no need to climb cliffs to get a complete view.

[\[return to text\]](#)

Note 22 --

Current flow in electricity is measured as **amperage** and represents the amount of electricity which moves from one location to another (like the amount of water flowing in a pipe or out of a faucet), and actually can be counted as the movement of electrically charged particles. If no particles (like, for example, electrons) move, or if they cannot move, there is no current. **Voltage** is the pressure behind the flow of current (like water pressure in a pipe). It is the difference in voltage from one location to another that causes the current flow.

The total amount of electricity delivered per unit time is measured in **watts** or kilowatts (1000 watts). This can be found by multiplying the voltage difference by the amperage, $w = v * a$. The total energy delivered is found by multiplying the wattage by time, and typically expressed as, for example, **watt-hours** or **kilowatt-hours**.

There is very little information in Peratt's article to allow a sense of the magnitude of the electric discharge of the "stupendous" plasma stream. He mentions that amperage of an auroral display scales to brightness, and suggests a level of 5 lamberts as a minimum for the former plasma stream. The auroras currently brighten only to 0.05 lamberts, at an estimated amperage of 5 to 10 million amperes.

Since Peratt speaks of a minimum brightness of 5 lamberts for the plasma stream, we could estimate the current flow of the plasma stream by scaling up. This would result in a current flow of 500 to 1,000 million amperes. I will use the figure of 1,000 million amperes. (In a later paper Peratt mentions "giga-amp" auroras. My estimate of 1,000 million amperes is one giga-amp.)

We have no idea what voltage difference drove the flow. At an estimated voltage difference of 300,000 volts between Earth and the ionosphere, the auroral display today delivers up to about 3 billion kilowatts ($(300,000 \times 10^7)/1000$).

The Sun today is estimated to present a potential difference of 100 billion volts to the surrounding exterior space. However, V. Bailey calculated 100 million trillion volts -- 100×10^{18} volt -- in *Nature* (1961). If we assume that the potential difference with respect to deep space is proportional to the volume of a planet, then Saturn might have been at 58 million volts. That would not be an unlikely figure to use, and leads to an estimate of 58 thousand trillion watts (58×10^{15} watt). The Sun puts out an estimated 4×10^{26} watts -- a lot more. (Juergens, *Pensée* circa 1972). (Another source estimates the Sun at 3.8×10^{20} watt.)

The world's annual use of electricity today is 17.8 thousand trillion watt-hours (17.8×10^{12} exp

15 watt-hours), which is only the smallest fraction of the output of the Sun (from the *CIA World Factbook*, estimate for 2008).

Where did all that energy go? If the Earth had no atmosphere or oceans, the energy of the plasma stream would have scoured the surface, loosening the bonds of molecules making up the rocky surface, ionizing them, and electrostatically launching them into space. But the Earth's surface is buffered with an atmosphere and oceans. The energy would have gone to altering the molecular (atomic) constituents of the atmosphere and ocean water, but probably mainly ended up electrostatically charging the Earth's atmosphere and ionosphere. Soon the surplus would have flowed out to the space surrounding the Earth, for it is doubtful if the Earth could have remained the end terminal of the plasma flow.

Saturn did not, even over 7000 years, discharge itself completely to the Earth (or the other planets). The discharge happened later, when Saturn met up with the giant planet Jupiter, 100 times the diameter of Earth, and three times the mass of Saturn. "Discharge" is a misnomer; actually the process is one of charge equalization, a reduction in the voltage of Saturn to match conditions in the space near the Sun.

[\[return to text\]](#)

Note 23 --

The geometry of plasma instabilities tends to certain numerical repetitions, as with the 9 toroidal flattenings of the column (which become seven when the top and bottom disappear from view), and the 28 and 56 exterior bundles of plasma surrounding the column.

The "Tree of Heaven" on Mesopotamian seals has never been identified as a botanical species.

It should be pointed out that the Chinese pagodas, like the stupas of India, are originally Buddhist architectural forms. The pagoda form was introduced into China after 200 BC.

[\[return to text\]](#)

Note 24 --

The plasma currently impinging on the poles of the outer planets (not Mars which has no atmosphere) and Venus produces a depression in the atmosphere, looking like the caldera of a volcano. It is thus likely that the arc to Earth struck directly through to the ocean surface by means of a similar hole in the Earth's cloudbank and into the ocean.

There are no volcano-like cloud banks surrounding these depressions for the planets with heavy atmospheres, for the plasma streams are in low level -- dark mode. For the Earth, in the past, with a plasma stream in arc mode, there would certainly have been a cone at the periphery of the arc's impingement at an ocean, consisting of rising water vapor.

[\[return to text\]](#)

Note 25 --

The trigrams of the Chinese *I Ching* (the *Book of Changes* used for telling fortunes) seem to derive from the sight of the rings of Saturn seen from below. The shadow of Saturn would be cast by the Sun alternately on parts of the bottom and the top rings -- which would change throughout the day and seasonally.

The diagrams were taken from a nearby tribe by the Chou dynasty, and texts were assigned in the 8th century BC, although the practice of fortune telling clearly dates from the Shang dynasty a thousand years earlier. All the trigrams are identified as landscape elements -- sky, lake, lightning (sun), thunder, wind, rain, mountain, and earth -- as if we are watching a land above the Earth.

About its own origins, the *I Ching* reads:

"Anciently, when the rule of all under heaven was in the hands of P'ao-hsî, looking up he contemplated the brilliant forms exhibited in the sky; and looking down surveyed the patterns shown on the earth. ... On this he devised the eight lineal figures of three lines each."

-- James Legge, translator, *The I Ching* (1882).

P'ao-hsî is the first legendary emperor.

[\[return to text\]](#)

Note 26 --

Depictions of the "world navel" (at various locations in antiquity) each represented the center of the Earth with a dome-shaped rock, at times with an entwined snake, perhaps representing a twisted Birkeland plasma stream. Each was considered to have been attached -- at one time -- to a placenta in the sky with a twisted umbilical cord.

The inflow of plasma at the poles of Saturn and Venus (today) is seen to bore a hole in the cloud cover, however. We would expect similar phenomena for the Earth. The point of electric contact was the conducting salt sea. The cloud dome of steam contained no salt and represented a much higher resistivity to the plasma flow. This argues against a plasma stream "snake" slithering down the exterior of the dome of the world navel.

[\[return to text\]](#)

Note 27 --

A cartouche is a shape made up of a rectangle with rounded corners, looking like rope which is tied or twisted at the bottom. It is a graphic form used to record the names of pharaohs. The name is written in hieroglyphics inside the cartouche shape. The cartouche first came

into use with Huni, the last king of the third dynasty, before 2613 BC. It likely represents the "shen" form of Jupiter, a disk on a bar, actually a plasma outpouring from the south pole of Jupiter which diverted left and right to the objects and dust of the asteroid belt. I have estimated in another chapter that this probably ended around 2690 BC, some decades before Huni.

The "Was Scepter," another device often depicted as being held by the pharaoh (representing his authority), looks like a putting iron with a two-tined fork at the other end, or, as someone once suggested, a "municipal water shut-off key." After seeing some of Peratt's plasma instabilities, it seems to represent the same image as the curious *Kokopelli* (a Hopi word) petroglyph figure otherwise known as "the flute player."

[\[return to text\]](#)

Note 28 --

The information below is developed in following chapters, and is used here to estimate the height of the cloudbank, both the water vapor clouds and the dome of plasma or aurora seen from further away.

The sight lines for the aurora or plasma dome as seen from Egypt (based on the orientation of mastabas and the first pyramids), China -- or more likely Mongolia -- (based on the recorded location of "the mountain at the center of the Earth"), and Ireland (based on the orientation of grave mounds) all intersect in the Atlantic somewhere near Southern Greenland and south of Iceland. In Northeastern Siberia the "world mountain" is held to be located directly east. This also leads directly to the North Atlantic. Mesoamerican monuments, after 2000 BC, have nothing to do with the polar plasma column.

[Image: height of cloudbank seen from 1000 miles away. Illustration by J. Cook.]

... Height of the Water Vapor Cloudbank

I doubt if the actual water vapor cloudbank exceeded 15 degrees (in width) of the circumference of the Earth in diameter, which is an arc with a length of 1000 miles (1600 km). And I doubt if the cloudbank extended more than a few degrees above the horizon. I am basing this on descriptions of the walled fortress of Ys seen by the European coastal peoples, that is, I am assuming the walled city floating on ocean water would not have subtended such a large angle as to make it appear significantly different from a city or fortress, so that, for example, it would not have been identified as a mountain or island.

It is interesting to make some estimates of how high this cloudbank might have been. Placed in the North Atlantic towards Southern Greenland, at about 30 degrees longitude and 60 degrees latitude, this would be 800 miles (1300 km) from England and the coast of France, and about 1200 miles (1930 km) from Portugal. I'll use one thousand miles as an average of the distance between the edge of the cloudbank and the location of England and France. This represents about 15 degrees of the Earth's circumference.

To be just barely visible above the horizon, we can start with the sightline tangent to the Earth at the viewing location (normal to the radius of the Earth) extended to the top of the cloudbank. This is a right triangle whose two legs are an Earth radius at the viewing location and the sightline. The hypotenuse is the radius of the Earth plus the height of the cloudbank.

The height can be found from $\cos(\theta) = r/(r+h)$, where r is the radius of Earth. To subtend 15

degrees the apparition would have been:

$$4000/\cos(15)-4000 = 141 \text{ miles high.}$$

To be seen above the horizon, the cloudbank would have to be higher than this. The angle above the horizon can be found from $\tan(\theta) = \text{height}/\text{distance}$. The distance in this case is the sightline, which is the base of the right triangle we were using: $b = \sqrt{(r+h)^2 - r^2} = 1071 \text{ miles.}$

An extra 20 miles in height would show the cloudbank at one degree above the horizon -- using $\arctan(20/1071)$ for a distance of 1071 miles to the location of the cloudbank. Twenty additional miles added to 141 miles is very high, considering that the stratosphere is currently only 40 miles high.

[Image: The inverted plasma dome seen from other locations (+) on Earth. Illustration by J. Cook.]

This height produces an image which has a 25 to 1 ratio of width to height (for an assumed width of 15 degrees of Earth circumference). This may be too low as an image of a fortified castle. One degree above the horizon would show the cloudbank at a height of twice the diameter of the Moon.

... Height of the Plasma Dome

In Northern Egypt, Sumer, Siberia, Mongolia, and Olmec Veracruz, the aurora or plasma dome was seen instead. Each of these locations is about 60 degrees of Earth circumference from the contact point of the arc.

Allowing 15 degrees as the radius of the aurora, each of the far locations needs to subtend only 45 degrees of the Earth's circumference in order to see the top of the aurora. I am here only making estimates for what would be the lower portion of a complete three-toroid disturbed plasma flow.

The two legs and the hypotenuse of the right triangle are defined as above, but the sight line is only extended to the edge of the aurora. As above, the height would be found from $\cos(\theta) = r/(r+h)$. For a 15-degree radius (30 degrees diameter) the apparition would only have to be:

$$4000/\cos(45)-4000 = 1656 \text{ miles high (2666 km).}$$

Certainly exceedingly high, but not at all unlikely, especially since we are looking at the inverted cup-like lower toroid which represents the lower quarter to lower third of a 250,000 miles to 500,000 miles long plasma stream (and possibly two or three million miles).

If the "serpopards" shown on the Palette of Narmer (circa 3050 BC, Egypt and elsewhere) represent the demise of the twisted polar column in 3147 BC, as I will elsewhere suggest, it would represent an upwelling of plasma surrounding the strike point of the plasma stream from Saturn (in glow mode) which at that time would have reached high enough to be seen from Egypt, and represented as the body of a long necked animal. That would suggest an inverted plasma discontinuity reaching over 3000 or 4000 miles (4800 or 6400 km) above Earth.

Likewise, to be seen from Guatemala, at 20 degrees latitude, the dome would have to extend a minimum of 1200 miles up from the ocean. To look like a mountain or mountains, as described in Book 11 of the *Chilam Balam*, we could add another 1000 miles.

[\[return to text\]](#)

Note 29 --

Mohenjo-Daro and Harappa in the Indus valley both have elevated platforms with crenellated

walls on the west side of the city. These are most likely temple platforms. The founding of both cities are dated, with some uncertainty, to after 3000 BC.

[Image: Left: Temple wall from the predynastic temple at Heirakonpolis (circa 3050 BC). After interactive.archaeology.org. Right: Enclosing wall to the compound of Djoser's pyramid (circa 2655 BC). After Francesco Raffaele.]

The buttressed mound appears in China during the Chou dynasty, after 1000 BC, but is modeled after Central Asian forms of burials. That Central or Eastern Asia could have seen a buttressed mound seems unusual. It would suggest that the cloud dome was much higher than would be suspected.

[\[return to text\]](#)

Note 30 --

When the Incas construct a mythology of their tribe in AD 1200, they insist that their ancestors first appeared from some local caves, as did many of the Mesoamerican tribes at earlier dates.

The "tortoise" is also, at least in Mesoamerica, the interpretation of the southern ball plasmoids first seen in 10,900 BC.

[\[return to text\]](#)

Note 31 --

Celtic legends describe the fortress of Ys. The city was walled, with brass gates or walls, floated on oceanic waters, and sank at the end of the "Era of the Gods" when the plasma stream ceased. There are dozens of variations on this theme, with the city under various names, with details matching aspects of the Polar Configuration. The Celts were the people of the west coast of Europe after 700 BC, after their invasion from Central Europe. The expansion of the Celts out of the Hallstatt region north of the Alps started in 400 BC. The

Celts brought a warfare-based society, iron weapons, horses, chariots, and extensive weaving experience.

Horus the Hawk

The first God of the Egyptians, as with others people, was a giant bird which traveled on a daily basis from east to west through the skies, seen either during the day or the night, depending on the season.

[Image: detail of the four standard carriers. After Francesco Raffaele.]

The hawk moved from the equatorial region of Earth to the north during the period before 10,900 BC, when Earth first dropped below the level of Saturn, and eventually circled above the north horizon. He was identified as a hawk (and had a ceremonial center at Nekhen, the "City of the Hawk," in upper Egypt) and his name was Horus, which admittedly is almost a generic name for "God" among the Egyptians, quite equivalent to "Lord." His movements from east to west for possibly 6000 years show up in the descriptive appellation "Horus of

the Twin Horizons."

Two of the four standards carried before the pharaoh on the "Palette of Narmer" depict the hawk of the east and the hawk of the west. Both of these also have banners hanging down from the tops of the poles. I will identify such bannered devices as these in the next chapters as images of the "plumes" of the east and the west, two of the four corner posts of the sky. This form (for the east and west cardinal directions) was also in use in Mesopotamia, where archaeologists have called them "circle" standards, but also identify them as "gate posts," where the upper circle is thought to be the hinge that a gate swings on. In Mesoamerica these are identified as trees, with birds at their tops.

The other two standards are easier to decode. One shows what looks like a stomach with an attached esophagus. In Mesopotamia this was originally the sign for "lugal" -- meaning "king." It depicts the southern ball plasmoids as a single entity. This becomes obvious with a look at the fourth standard, which is a plow with a jackal on top. This is the constellation of the Little Dipper, which at that time rotated around the North Polar axis which at that time was located in the pan of the Big Dipper, plowing, like Saturn also did, the fields of the northern stars. This depiction remains in use until Roman times (as, for example, the sky map carved in the ceiling of the temple of Hathor at Denderah).

The appearance from 10,900 BC to 8347 BC of the three southern ball plasmoids seems not to have detracted from the status of Horus in the north. On the "Palette of Narmer" a hawk is shown as owner of the people of a papyrus swamp. Archaeologists have assumed this to signify the conquest of the swamp region of the delta, even though the delta was flooded following the flood of 3147 BC at the time of the "Palette of Narmer" (so says Herodotus). The papyrus blooms shown on the Palette of Narmer probably signify the Duat in the south skies, rather than the delta (also held to be a swamp full of reeds). The papyrus buds might signify the Maruts, the "Followers of Horus," which numbered six from Vedic sources (Cardona).

The four beams of excited electrons seen in the skies during the earlier period are probably the basis for the Sed Festival of the pharaohs, a ceremony of laying out the land (as a survey) for agricultural use, already depicted by 3050 BC (as on the "Mace-head of Narmer"). It obviously relates to some sort of agricultural ceremony, as shown on a number of early grave-goods tags also.

The eight lowerings of Mars during the "Era of the Gods" kept the God Horus alive in religious symbolism and iconography. The Palette of Narmer is a clear indication of this. In much later genealogies of the Gods, Horus is known as "Horus of the Gods" during the period before 3147 BC.

In 3147 BC, the home of the Gods was attacked by Jupiter, the Bull of Heaven, who had been seen in the skies as a crescent for thousands of years and is depicted on the Palette of Narmer also. I'll detail this in the next chapter.

The Changing Celestial Display

Over the course of the thousand years of Saturn's rule, 4077 BC to 3147 BC, the images in the sky differentiated into a family of Gods. New details developed from the appearances of intervening planets, changes in the plasma column, and displays of plasma discharges into the space surrounding the upper sphere. The rings seen above Saturn become the Goddess Nut upholding the sky above Geb, the God of the first land (the lower rings), where the Gods live. (Alternatively Nut and Geb could be placed in the far south, and in the period of 10,900 BC to circa 9000 BC.)

During all this time the companions of Saturn were visible -- not only the planets Venus, Mercury, and Mars, but especially the busy moving satellites of Saturn. With these satellites milling about the original creator God, this scene becomes the model for Upper Earth as the "home" of the Gods. The seven satellites become the Gods who lived in the upper land.

[\[note 1\]](#)

In both Mesopotamia and Egypt, records of the genealogies of the Gods were kept. Male and female deities were identified. However, the gender of the Gods varied over time and by location. Names and roles were frequently interchanged, as political contingencies required. The Gods were not initially identified with specific planets. There was, at that time, no concept of a planet at all. There were only the Gods. [\[note 2\]](#)

The images in the sky became symbolic objects in later developing civilizations, only to become unreferenced emblems at the remove of several thousand years. The scepter, crown, and throne of kings, the altar, the cross, and church steeple, the halos of saints, the sword in the stone, the swastika, and hundreds of architectural details, still in use today, all derive from the initial forms in the sky. The symbols were kept, even when the original associations were completely lost.

Not to be neglected either, are the auroras surrounding the incoming plasma stream. Where the stream of plasma connected with Earth, the outstreaming of electrons would have produced auroras adjacent to the lower part of the stream, probably of a circular pattern (responding to a circular magnetic field surrounding the plasma stream) and thus seen from afar as matching left and right. These are perhaps the lions or goats standing up against both sides of the tree of heaven as depicted in Sumerian art. At a later time these are griffins. The Egyptians use the same or similar images. Paired animals appear in the Palette of Narmer in circa 3050 BC, and other earlier palettes.

The Start of Time

When Saturn went nova in 4077 BC, the surrounding glow mode coma disappeared and the skies of Earth cleared to also show the Sun. The creation of light was attributed to the God Saturn, and it was Saturn that was called "the Sun," not only in Egypt, but almost everywhere

else on Earth.

With the (real) Sun lighting the side of Saturn, and as viewed from Earth below Saturn, a bright crescent started to rotate around the central globe of Saturn on a daily basis, looking much like the crescent of the Moon today. This would persist even after Saturn had ceased its arc mode display.

But considering that initially Saturn was lit up like a blazing sun, I doubt that the crescent due to the (real) Sun would be seen at first. Thus we can actually claim that Saturn invented time -- when it no longer blazed, but had reduced its output or dropped to dark mode. That is when a crescent would be seen at the edge of the globe, rotating counterclockwise on a daily basis.

The crescent was part of the Sun-lit half of the Saturnian globe. From the perspective of Earth, only a small section of this was seen. As the Earth rotated (below Saturn), the crescent appeared to move counterclockwise around the outer rim of the globe on a daily basis. The crescent dimmed as it moved up toward the "top" of Saturn during the Earth's daylight hours, and brightened again as it dipped down to the bottom at night. (Brightened, that is, in comparison to the darkness of night.) The first experience of clock-time had started for humanity.

I have taken this description from Talbott's *The Saturn Myth* (1980), while attempting to keep in mind the relocation of the globes in a stack, as later proposed by Thornhill. It becomes obvious from this that the size of the crescent might vary with the seasons, for at various times the crescent would extend over more of the sphere of Saturn.

The crescent was not only experienced as a marker of the passage of day and night hours, but it was also seen as a boat -- the Barge of Heaven. It is the "ship of the Sun," depicted with a raised prow and stern, and resembling the ships which did commerce up and down the Nile. However, the "celestial ship" also clearly showed the use of oars in its movement around the edge of the overhead globe, despite the fact that Egyptian commercial vessels seldom used oars for rowing. The "oars" are streamers of plasma rising from the surface of Saturn. Seen from below, the ship would seem to rotate on a daily basis. [\[note 3\]](#)

Nearly identical images appear as rock carvings in Bronze Age Northern Europe, complete with the oars (and never with sails, although sails were in common use in the North Sea) and, like many late Egyptian images, often carrying the "Sun" as a giant globe at the center of the ship. [\[note 4\]](#)

The Saturnian globe had developed encircling rings of light, the brightest at the edge of the globe, and four "rivers" (or more) meeting at the center and quartering the globe. The area enclosed by the circle of the planet initially shimmered like a field of grain in sunlight.

The First Land

It was understood to be the first land to have risen out of the waters, the home of the Gods -- Olympus, Upper Earth, Paradise, but often just called "Earth" or "The Land." [\[note 5\]](#)

[Image: Plasma streamers in high-density glow mode (or arc mode), impinging on Mercury. This is seen from the side (the Sun is behind Saturn, Earth is further below). In the inset box, is the view as seen from Earth. Mars is in front of Mercury. Modified from David Talbott, "Symbols of an Alien Sky," (slide presentation, 1997).]

The streams quartering the "fields" of the upper land were actually plasma flows at glow mode or arc mode encroaching on Mercury, located below Saturn. The plasma streams originating from Saturn divided into three, four, five, or eight streams at various times. Venus, claimed by others to be the planet directly below Saturn, could not have supported a separation of the plasma flow into distinct bundles, because it lacks a magnetic field. This planet was Mercury, not Venus.

Four streams would be the most likely form. When there were four of these, they were identified as the four rivers of Paradise of the Bible. When seen behind Mars these formed what looked like a star (the streams going to arc mode at Mercury which generally stood directly behind Mars). This bright star form was understood at times as constituting a separate god or goddess. A star within a crescent (the Sun-lit edge of Saturn) is still used as a symbol in Islam. The crescent also remained in use as an emblem used in Roman (and other Mediterranean) coins through the third century of the current era, but associated with different meaning. [\[note 6\]](#)

Together, the image of an eye -- the broad crescent below it (at midnight), the outstretched wings of Saturn's rings, and the column to Earth -- looked like a giant one-eyed person astride the Earth on the north horizon with arms outstretched. The apparition moved. It changed shape and color. Venus may have moved like a snake around the central eye. And

then Mars started to approach the Earth and retreat again, growing larger and smaller.

[\[note 7\]](#)

[Image: Neolithic pots with wave designs. Unknown source.]

Having no concept of the size of the Earth, no concept of space, having not seen the stars for the last 6000 years, and having no reference other than plants and animals and the elements of their own stone-age culture and limited localities, the Neolithic humans anthropomorphize the vision in the sky and take the apparition to be a giant person. Taken all together it was not seen as a celestial phenomenon, but as a God, or more properly as an overlord, which was a political concept just entering the agricultural lands of Mesopotamia and Egypt. [\[note 8\]](#)

Most of the southern sky of Earth was shrouded by bands of particulate matter and ionized gases which had formed in the plane of the Earth's equator perhaps from earlier plasma strikes by Saturn, dating back millions of years. This series of bands or rings extended out perhaps 8500 miles (13,700 km) from Earth, and was called the "Absu," the "sweetwater ocean," by the Sumerians (because rain came from the sky). The Earth's rings were individually disturbed by wave patterns, making the south sky look as if it were filled with a gigantic ocean. Like the rings of Jupiter or Saturn the nearest (lowest) bands moved faster than the Earth's rotation. The furthest bands moved slower than the rotation of the Earth. (Both moved to the east.) Visually the effect of these bands moving at differential speeds was quite like looking out on a sea. [\[note 9\]](#)

When Saturn went nova and started to blaze like a sun, humans almost universally called this event "creation," despite the fact that mankind had existed from much earlier times. Why is it that this event was called "creation" by the first humans to write records, when obviously they themselves must have been created much earlier?

Probably because "creation" dealt with the creation of "Heaven" or "the Land," not with the mundane world of Middle Earth which had always existed. "Creation" dealt with the self-

creation of the Gods, not mankind. The creation activities of the Gods, starting with the ball plasmoid Gods of the far south had taken thousands of years. The result was spectacular: where once there were shadows and only a dull light, there now stood before humanity a blazing Sun. It happened with the suddenness of a few hours or days. And then things were never the same again. The Gods were seen: they milled around the edges of "the land," and some (like Venus, Mercury, and Mars) were huge in size by comparison.

Mankind never reflected on its own genesis, and held itself as insignificant in the face of the stupendous prodigies seen in the skies -- the lowering of the God Mars to Earth, the auroral displays, unexpected strikes of lightning from an electrically overcharged upper atmosphere, and the play of Saint Elmo's fire among tree tops. With the blazing of Saturn suddenly everything took on a saturated color. The signs and objects in the sky had been there for over 4000 years before creation ensued. There certainly was no thought of a creation of everything out of nothing -- the only concern was to mark the creation of heaven and the Gods.

Humans conceived of their limited Universe as consisting of a bowl-shaped depression (where they lived), with the south sky filled with a sea, and the north sky now occupied by a new land which had risen out of the swirling waters of the north (another sea), and connected to Earth -- Middle Earth -- with a river of plasma. Away from the globe of Saturn and its rings, the northern stars could be seen. They would end up being called the "imperishable stars" by the Egyptians.

The God Visits Earth

Mars descended the polar column a number of times during the "Era of the Gods." Located between Saturn and Earth, Mars started to move down from Saturn, coming closer to Earth, while remaining enclosed in the stream of plasma connecting Saturn to Earth, looking larger and larger in the process, until Mars hovered above the North Pole of Earth as a giant red sphere. In effect, it was seen as the God visiting Earth. The humans were delighted and built temples to receive and house the God. The visits to Earth happened repeatedly, at intervals of about 120 years or more.

Mars, located below the south pole of Saturn, acted as a short circuit across part of the electric discharge between Saturn and Earth. Mars's northern hemisphere is marked with gigantic electrical blisters, but is otherwise devoid of the thousands of scars and craters which pockmark the southern hemisphere. The blisters on the top half are clear signs of repeated massive lightning strikes, and the surrounding swollen ground takes on the same form as more modestly sized lightning strike blisters to non-conductive surfaces on Earth.

[\[note 10\]](#)

About the movements of Mars, the *Chilam Balam* reads:

"Then the heart of the flower came forth to set itself in motion"

The heart of the flower is Mars. When Mars was closer to Saturn than to Earth, it would look like a tiny dot at the center of the flower form. The flower itself is Mercury, which could be a quarter million miles below Saturn. It would look like a petaled flower because of numerous streams of plasma impinging individually on the planet in a circular pattern. Talbott has noted the form from Egyptian and Mesopotamian sources, and has described changes in the flower form. One effect is that the flower shape distorts as Mercury moves away from being centered on Saturn: some petals visually grow shorter, while others grow longer. The shape starts to look more like an opened seashell. This would also happen if either lowered from Saturn -- that is, if one or both of the planets got closer to Earth. Of course there are other possibilities: the Earth also might have moved (relocated) to an off-center position. (By the way, the allegorical "Birth of Venus" by Botticelli, has substituted the Latin Venus for Mercury. There is more confusion in that the event was meant to describe the birth of the Moon. She stands, however, on a half seashell.)

When located in the chain of the conducting stream, Mercury and Mars would increase in charge and be repelled from Saturn toward Earth. After losing its surplus charge to Earth, Mars would move back up again along the plasma stream toward Saturn. Mars's mass is only one-tenth of one percent of the mass of Saturn. In the vocabulary of electric measurements, Mars is the gold leaf in an electroscope.

This movement easily explains the apparent increases and decreases in the size of Mars. In mythology Mars (under various names) frequently transforms into a dwarf or a giant. Ev Cochrane, in *Martian Metamorphoses* (1997), presents any number of examples from around the world of Mars, or his namesake, changing from a giant to a dwarf, and the reverse. As Mars moved down the plasma stream, it would not only increase tremendously in size, but it would have moved away from its location centered on Saturn. Mars would at first be seen to move to the edge of the disk of Saturn in the direction of the earth's polar axis. Mars would then be seen to increase in size, moving past the edge of Saturn in the direction of the Earth's axis of rotation. This would suggest that, as Mars neared to perhaps within 30 diameters of Earth, it would have been seen at the location of the axis of the sky. (The pole star location varied in time).

But simply the nearness of Mars, centered on the Earth's rotational axis as Mars approached Earth gravitationally, would have led to bending the plasma stream connection from Mars to the Earth's magnetic pole. This could have caused the changes in the rosette pattern at Mercury -- an offset of the circle of streams seeming to encircle Mars, making it look as if Mars was placed in a spray of petals radiating from an edge or looking (as I have noted) like a seashell. Mars would have increased in size, but remained in line with the rotational axis of Earth, because it would be gravitationally attracted to Earth.

The continuation of the plasma stream below Mars would normally be of a limited width below Mars, and would extend to the north magnetic pole in the North Atlantic (probably boring a hole in the water vapor dome which would have welled up at that location).

The whole of the bottom section of the plasma stream from Mars would likely be seen as a leg extending down from Mars. The Maya *Chilam Balam* calls this the tongue of Bolon Dzacab (Mars). A stream of plasma extended from below Mars is confirmed from the fact that Mars (under various names) was depicted during the Maya Classical Era with a single leg consisting of the body of a snake (but this may be related only to the 8th and 7th century BC).

This leg is generally held to be a thunderbolt by archaeologists. In the Quiche *Popol Vuh* Mars provides fire for the tribes at a very early time in the narrative. The lower hemisphere of Mars would indeed "be on fire" with the continuous explosions of electric arcs. The "tongue" of Mars (also seen in the central figure of the Aztec Calendar Stone) would be a glow mode plasma which, because it is dispersing and lessening in density as it distances from Mars, would change to an invisible dark mode. [\[note 11\]](#)

Depicting the Past

In Mesopotamia and Egypt, references to these images in the sky abound, but especially verbally in mythology. Egyptian priests felt it their duty not to discard any information, for all of it was considered part of the genealogy of the Gods and, by extension, the genealogy of the kings and pharaohs. The details of the mythological actions and symbols constitute a welter of confusion for us today. Around the world creation would be recalled as "mythical" histories. That these are actual histories, however, and not imaginative narratives, stands out from the fact that, not only are the same tales told around the world, but all the varied "myths" generate neither the suggestions for exemplary behavior or morals, despite Joseph Campbell's contrary claims -- they are simply descriptive. [\[note 12\]](#)

Both the Mesopotamian and Egyptian textual records of these phenomena (spells and later histories) are sparse and late. Two factors might account for this. First, writing, although initially invented before 3000 BC, only slowly developed from initial commercial uses -- invoices and bills of lading -- to the proclamations of kings and dedications of temples. Narrative use took an even longer time to develop. The tales and histories that we so urgently want to hear were not considered fit material for letters and scripts.

Second is the fact that common experiences are seldom recorded at the time they occur. Histories are written after the fact -- when things have changed or when the need exists to justify the present in terms of the past. This often has to wait 300 to 1000 years. [\[note 13\]](#)

In both Egypt and Mesopotamia, images of the polar configuration of the "Era of the Gods" (4077 to 3147 BC) do not show up until the cosmic display has disappeared from view. In Egypt the images show up almost immediately, with a lag of perhaps only a few decades. In Mesopotamia it would take longer. In both locations, the imagery remained stable after it first appeared and changes very little over thousands of years. The stability of the iconography is an important indication of the factual basis underlying the depictions. The images were

guarded and authenticated, but created from divergent recollections, descriptive in noting that it was a giant "person" but with only some of the recalled attributes actually translated to a depiction of the God.

In Mesoamerica, there existed a tradition of recording actual history pictorially in bark books. We do not know how much of these histories were recorded contemporaneously with the events, and how much was based on later recollections. Some of the recorded events, from the few curious references we have, may have dated back to 40,000 BC, and certainly to 10,900 BC. Events are described which match what we know from other sources -- primarily archaeological and primarily from the Eastern Mediterranean. The books existed, and were quoted and referenced as late as the 16th century AD. (For which see the chapters "The books of the Chilam Balam," "The Olmec Record," and "The Popol Vuh.")

The attitude which required the recording of events in Mesoamerica, when nothing of the sort was ever accomplished (as far as we know) in the Eastern Mediterranean, might be due to a grammar heavily dependent on action verbs, where whatever was accomplished required a protagonist, an actor who completed the action. As I will show in later chapters, the result is a set of data much more extensive than anywhere else in the world, which can be collated to what we know of events worldwide archaeologically, or which can be inferred from other sources.

[Image: Jupiter on his throne; Hammurabi speaks to God. Image after circa 1700 BC.
After printablecolouringpages.co.uk.]

In the era after 3147 BC we are dealing with attempts to graphically depict many differing recollections, all of which were true at one time or another and had become fixed in the imagination, even though the original forms may have changed in appearance over time. I

find it reasonable to assume that once an abstract image is given a familiar identification, in terms of "it looks like ...," it would remain the same, even when the original changed considerably.

Unlike the European representations, which continued to hold the image in the sky as a female figure or a house, in Egypt and Mesopotamia the interpretation of Saturn and the plasma stream was of a person, a supreme being -- which in Egypt was assumed to be the pharaoh. It is a head seen in profile, to which the puffy beard is added (as in Mesopotamia also). Intermittent aspects of the plasma stream, some of the discontinuities noted by Peratt, become the magical or fetish symbols of the pharaoh -- the Ankh, the Djed Pillar, and the Was Scepter. In Egypt everything was retained and assigned a purpose in a plan where the pharaoh now is the God that was.

In Mesopotamian depictions the tree to heaven, complete with a globe at the top, is placed on seals next to the very human-looking image of the God, who is seated on a throne. On the other side, facing both the tree and the God is the king, the caretaker of the God's fields. The tree and globe, which originally was the God, is now a separate form shown next to the throne of God.

In Mesopotamia the God is seated. To have the God seated on a throne, rather than standing, probably is a reference to the fact that the celestial image was fixed in space. God did not walk around the heavens. In many seals God holds in his hand a device, the shen, which also shows up in Egypt both as a magical object and in outline as the form used to write the names of pharaohs or deities -- the cartouche.

In Mesopotamia, the seated person is actually the next God to take over rulership of the world, after 3147 BC -- Jupiter. He is clearly identified by his twisted turban headdress and his full-length robe. In one seal there is an adjacent star, surrounded with 9 smaller globes, the readily visible satellites of Jupiter. In some representations Jupiter is seated on a symbol for "temple" which in turn is set on a layer of bricks. The God is thus now assigned to a specific location on Earth, his home and temple.

He is wearing a long garment representing the massive mountain/skirt outpouring of plasma at the south pole. The rays shown at his shoulder are the much smaller plasma plumes extending from the north pole. (The magnetic poles of Jupiter are reversed from what is encountered for other planets. More on this in a following chapter.) The device held by the God, called a "shen" in Egypt, represents a horizontal plasma outpouring from the south pole of Jupiter during the time spent in the asteroid belt.

[Image: Palette of Narmer, circa 3050 BC. This is a dedicatory cosmetic palette found buried beneath the floor of the temple of the Falcon at Heirakonpolis (Nekhen) in Upper Egypt. This was at one time thought to represent the unification of predynastic Egypt, since the pharaoh wears the Red Crown of Lower Egypt on the obverse (left) and the White Crown of Upper Egypt on the reverse. After Francesco Raffaele.]

In Egypt, where the pharaoh is held to be the God, he stands and is seen in profile. The pharaoh also wears a fluffy beard, and later sports the cobra form of Venus (originally part of Saturn) on the headband to his striped "nemes head covering." The nemes may be equivalent to the projecting rays at the shoulder of God in Mesopotamia, or it may represent the mountain of Jupiter which disappeared at the beginning of the second dynasty. The nemes head cover first shows up in the first dynasty.

On the Egyptian dedicatory "Cosmetic Palette of Narmer" (dated to 3050 BC), the king (who is the God) wields a club to smite his enemies, even though short swords had long been in use in Egypt. The club is Venus and its plasma tail. The unfortunate enemy is the already disappeared Uranus, grabbed by his long hair.

King Narmer of the "Narmer Palette" (with the proper name of "Catfish Drill") also wears a long fluffy tail (held to be a bull's tail by Egyptologists) from his belt, reaching to his ankles, which is a depiction of the plasma outflow from Saturn in glow mode, but could also signify that Jupiter shows up in 3147 BC as a bull which wrecks the home of the Gods (which is shown on the Palette, by the way). The "Palette of Narmer" which shows the pharaoh with captured enemies, is already almost unreadable in the density of its symbols. Only the fact that the symbols will stay the same for the next 3000 years has allowed us to read some of them.

The Gifts of the Gods

During the "Era of the Gods" mankind was given many gifts. Writing was universally held to have been taught by the Gods, not only in the Near East but also in China. As I have mentioned, for the Egyptians, the changing shape of the column above the North Polar region became the model for many hieroglyphic signs, with some signs used on pottery predating 3000 BC.

Humans similarly insisted that agricultural practices were shown to them by the Gods. The "canals" seen crossing Paradise became the model for the irrigation canals constructed in Mesopotamia. Even though irrigation canals probably predated the design of the Gods, the concept was attributed to them. The column which rose from the North Atlantic was seen as a river flowing from Paradise, and the Nile, Euphrates, Tigris, Indus, and Sarasvati were understood to be extensions of this river. The bright anode tufts on the Saturnian surface are seen as golden grain waving in the wind. Four thousand years later, the Incas mold gold into stalks of maize to stand before the temples of their Emperor God.

In Mesopotamia, and elsewhere, humans tended the fields and flocks of the Gods believing that they were the slaves of the Gods, as even the late (1700 BC) Babylonian creation myth of the *Enuma Elish* recounts. Kingships of the next age were understood as stewardships in the service of the Gods.

Worship was performed as directed by the Gods. It included music, dance, and gifts of food to the Gods, and a decor derived from the colorful displays in the sky. Modeled on the battles in the sky seen in 3147 BC, worship also involved human sacrifice almost everywhere.

[\[note 14\]](#)

The architecture of mastabas and the temple-enclosure walls of Egypt and Mesopotamia were modeled after the buttressed wall seen erected by the Gods (the cloudbank seen at the northwest horizon). Later pyramids and temples faced north to receive the God (the visits of Mars), but all the early mastaba graves faced the strike point of the plasma arc in the northwest. [\[note 15\]](#)

The early civilizations took the events in the sky not only as mandates for their activities, but also as the analog for all heroic and religious narratives, from the *Epic of Gilgamesh* to the Egyptian, Near Eastern, Celtic, and Christian resurrection theologies of later antiquity. The "history" of the lives of the Gods became the model for storytelling which runs from Sumerian epics through Greek mythology, on through the medieval Arthurian cycles and later fairy tales, and into the present. [\[note 16\]](#)

Living in Paradise

In summary, for a thousand years during the "Era of the Gods," from 4077 BC to 3147 BC, it

was Paradise on Earth. The climate in the Middle East was mild and wet. With Earth in an orbit **below** Saturn, the Sun would not have been at the center of the orbit. The northern hemisphere would have faced the Sun year-round, and there would not have been the drastic changes in seasons we experience today. Mankind lived in harmony with the Gods, who supplied the techniques of agricultural cultivation, the plans for cities and temples, and the knowledge of the wheel, writing, and music. And for a thousand years the images in the sky provided a spectacular show.

The interplanetary plasma flow must also have built up an enormous amount of static electric charge in the upper atmosphere, to the point where mountain peaks would have been under continuous lightning strikes. And in addition to the electrostatic charge of the atmosphere, mankind was subjected for a thousand years to a varying magnetic field, a by-product of the rotating Birkeland current. If this arcing was even occasionally of the right amplitude and frequency, this could have had a long-term beneficial effect on the psyches of the humans. I have long suspected some such secondary results from an arc discharge. Research at Harvard's McLean Psychiatric Research Hospital has demonstrated the effects of an oscillating low-level magnetic field. To quote from a patent application, the use of a localized magnetic field is indicated for subjects with symptoms of "anxiety, moodiness, depression, lethargy, sleepiness, learning difficulties, and memory impairments." [\[note 17\]](#)

Imagine then, humans -- content, cheerful, outgoing, energetic, alert, intelligent, and enjoying a mild climate, living with the Gods, quick to learn, inventing everything from the wheel to writing, forming egalitarian groups to build massive irrigation projects in a desert wasteland, engaging in the manufacture of ceramics and metals, and trading these far and wide. It must have been a millennium of optimism which supported each and every effort. This certainly was the "Era of the Gods."

But then, after a thousand years, the same Gods decided that the humans were too loud, and that they would shut off the electricity and drown them all. That happens in 3147 BC.

Endnotes

Note 1 --

Ancient sources list seven "companions" of Saturn. Nine satellites could be counted if the very small satellites and those on very close orbits are neglected. The nine were all discovered before the twentieth century by telescope. However, two of the nine satellites, Iapetus and Phoebe, are on extremely distant and irregular orbits (3,561,300 km and 12,952,000 km). That leaves some seven satellites which are easily seen, and could be understood as "companions." The God of the Bible is also accompanied by seven archangels.

Moon #	Radius (km)	Mass (kg)	Distance (km)	Discoverer	Date
Titan VI	2,575	1.35e+23	1,221,850	C. Huygens	1655
Rhea V	765	2.49e+21	527,040	G. Cassini	1672
Tethys III	530	7.55e+20	294,660	G. Cassini	1684
Dione IV	560	1.05e+21	377,400	G. Cassini	1684
Enceladus II	250	8.40e+19	238,020	W. Herschel	1789
Mimas I	196	3.80e+19	185,520	W. Herschel	1789
Hyperion	205x130x110	1.77e+19	1,481,000	W. Bond	1848
.....					
Iapetus VIII	730	1.88e+21	3,561,300	G. Cassini	1671
Phoebe IX	110	4.00e+18	12,952,000	W. Pickering	1898
		"e+n" denotes 10 exp n			

As recounted in de Santillana and von Dechend's *Hamlet's Mill*, according to Norse mythology, as well as Indian and many other sources, seven women operated the mill (Hamlet's Mill) of remote antiquity. Venus, connected yet with a plasma stream to Saturn, might have represented the handle of the mill, with the plasma column as the shaft. The mill stones would be located in the sea where large clouds of grist bellowed up.

The "Prose Edda" (of ca Ad 1200) lists nine women. This could be the count of the seven satellites plus Mercury and Mars. The planets above Saturn were not visible in the last few thousand years before 3147 BC.

The current seven large satellites of Saturn, plus the additional two, and their radiuses and orbits, are as follows:

The seven satellites known as the "Companions of Osiris" guarded Osiris's coffin. Four of them, perhaps the four large satellites (Tethys, Dione, Rhea, Iapetus, but not the giant Titan), remain as the "Sons of Osiris" (originally the "Helpers of the King") in funeral practices. They are shown as seated mummy forms, often seated on a lotus blossom (the rings of Saturn), and they guard the four canopic jars containing the viscera of the body.

[\[return to text\]](#)

Note 2 --

Many of the Gods, especially the initial Gods, are born as twins, identified as brother and sister, who then marry to generate children, frequently in groups of seven or nine. Some Gods also come into being as deifications of the elements of the celestial display. The Gods Nut and Geb are today identified by catastrophists as the upper and lower rings of Saturn, although they more likely belong in the far south as part of the southern ball plasmoids of 10,900 BC through 8347 BC.

William Mullen, in 1994, suggested that Isis and Nephtys (her helpful sister) were originally assigned to the two outer satellites of Saturn, Iapetus and Phoebe. But in terms of size, Venus and Titan are more likely candidates.

Neith was also identified with Venus by Plato. But Neith is most likely a manifestation of the southern polar plasmoid. She is known in the West Saharan nome as a snake, a weaver, and an archer. The crossed arrows which are one of her symbols probably represent the electron

beams. The goddess was known throughout the Sahara in remote antiquity.

Thirty-three telescopic observations were made of what looked like a moon of Venus by fifteen reputable astronomers between AD 1672 and AD 1761. The object looked like a moon because it showed the same phases as Venus, and therefore must have been close to Venus. Movement was noticed and some calculations were made of its period (11 or 12 days), size (one quarter the diameter of Venus), distance from Venus, and orbital inclination and eccentricity (0.195). It has not been seen since, except for once more in 1892, by Edward Barnard of Lick Observatory, who had set out to prove that there was no companion satellite to Venus. Space age exploration has found nothing. From Patrick Moore, *Venus* (2002).

Note 3 --

Egyptian river commerce depended on the current to move north, and on prevailing winds to move south. The large oars depicted in images of Egyptian ships are for steering.

David Talbott, in "The Ship of Heaven" *Aeon* (1988), describes aspects of the ship from Egyptian sources, both from early iconography and from later depictions and descriptions where the original elements are kept alive, but are confused. He also points to other descriptions of the ships of the gods worldwide, excepting only Mesoamerica. I think some of the descriptions would better fit a later model -- where the Gods move along the edge of the Absu of the southern sky rather than being towed around the edge of Saturn.

David Talbott writes:

"According to the model, the apparition began to grow bright as the crescent descended to the left of Saturn; reached its point of greatest splendor when the crescent was directly below Saturn; began to diminish as the crescent rose to the right; and was its weakest when the crescent was directly over Saturn. This daily cycle, I have claimed, is reflected in all ancient symbolism of the Saturnian 'day' and 'night.'"

The direction is correct for Earth revolving to the east and below Saturn. The stars at the pole move in the same direction: down on the left, to the right at the bottom, and up at the right of the pole. Saturn's daily rotation involves the same path.

Egypt, as well as other nations, counted the start of the day from nightfall.

[\[return to text\]](#)

Note 4 --

These Bronze Age images probably represent Jupiter as the Midnight Sun at a much later date. The image created in this instance would be almost identical to the earlier Egyptian images of a globe resting on a crescent. The location in the skies would be different. See later

texts.

[\[return to text\]](#)

Note 5 --

The home of the Gods moves from an "upper land" to a mountain after 3147 BC. This mountain, seen by the ancients, at first was the plasma outpouring from below Jupiter, which probably only lasted 287 years. It was replaced early by a plasma mountain formed by Mars on close passes above Earth at thirty year intervals which lasted for maybe 300 years after 3070 BC. The mountain of Mars was seen in the north. Jupiter appeared on the ecliptic instead. Much later, from about 2527 to 2438 BC and again from 2349 to 2150 BC, the mountain of Jupiter returned as the plasma expulsion from its north magnetic pole, located at the south geographical pole. More on this in later chapters.

[\[return to text\]](#)

Note 6 --

The form of a star within a crescent also appears whenever bright planets (Jupiter or Venus) dip behind the obscuring Absu in their travels along the ecliptic. See the chapter "Hezekiah and Babylon" where Babylonian records after 685 BC are discussed.

[\[return to text\]](#)

Note 7 --

Venus is the uraeus (the rearing cobra form) used with the crown or headdress of the pharaoh. From this image (which is already in use in 3000 BC), and some other considerations, I would suggest that the revolution of Venus might have been synchronous with the rotation of Earth (and Saturn), so that, as seen from Earth, Venus was always seen as placed to the left and "above" Saturn (in his right hand). Even the earliest images of the pharaoh "smiting his enemies" have the figure facing (or moving) to his left.

Talbott has identified the uraeus and the sidelock of hair (seen worldwide on young boys) as a feature of plasma streams impinging on Mars and extending toward Earth from below Mars. These forms were likely composed of ionized Martian dust. At a much later date (the 8th and 7th century BC), the same extension of ionized Martian dust into nearby space probably resulted in descriptions in Mesoamerica of Mars as a bat.

[\[return to text\]](#)

Note 8 --

The idea of a person (man or god) standing at the north horizon is very strong and occurs in many mythologies. "With the face of a mirror" reads one Mesoamerican description. With distance from the initial event, and for people less inclined to make a big fuss over the images in the sky, this giant man becomes the first man to have been created, as Adam

("man") of the Hebrews, and Manu ("man") of the Hindus. Titus Flavius Josephus, the first century AD Roman Jewish historian, in *The Antiquity of the Jews* (AD 93), notes, "*This [first] man was called Adam, which in the Hebrew tongue signifies one that is red, because he was formed out of red earth, compounded together.*" That might point to Mars rather than Saturn. However, the life span and death of this celestial Adam point to a birth in 4077 BC (3147 BC - 930 BC), close to my earlier estimate of 4100 BC, as the start of the initial blazing of Saturn.

[\[return to text\]](#)

Note 9 --

The Absu extended as a set of inclined bands in the southern sky below the equatorial. The equatorial is an imaginary extension of the Earth's equator into the sky, from directly east to directly west, but set at an angle above the south horizon equal to the complement of the latitude on Earth from which it is seen (the latitude subtracted from 90 degrees). Thus at 30 degrees latitude (Mesopotamia and Egypt) the equatorial is placed 60 degrees up from the southern horizon. The celestial ocean, the Absu, stood up somewhat short of 50 degrees (which was estimated in an earlier chapter).

[\[return to text\]](#)

Note 10 --

It could be suggested that the northern hemisphere was entirely removed due to an even larger plasma contact -- simply machined away. But this is unlikely. The lower altitude of the northern hemisphere is of greater density than the lower hemisphere (thus maintaining a planetary balance). It also suggests the past existence of an ocean which might have been entirely removed with electric arcing. There are clear strand lines of two northern oceans, one contained within the confines of the other.

It might then be suggested that the arcing of the northern ocean was the display in the skies seen by humans in the Upper Paleolithic, say 30,000 years ago, and recorded as the "cup and tail" petroglyphs (as mentioned in a previous chapter). It would mean that Mars would have been close to Saturn. And it also suggests that Mars has been a "dead" planet for a very long time.

[Olympus Mons and seven other blisters. After NASA.]

"The most curious aspect of the map [of Mars] is the striking difference between the planet's low, smooth northern hemisphere and the heavily cratered southern hemisphere, which sits, on average, about three miles (five kilometers) higher than the north." -- GSFC/NASA

Shown below is Olympus Mons. The caldera of Olympus Mons is 40 miles (65 km) in diameter, an area of 1200 square miles -- large enough to contain the cities of Chicago, NY city, and LA -- but shows no lava flow. Olympus Mons has the shape of a pancake, and is three times the height of Mount Everest. This would have been a strike of an absolutely astounding magnitude. As noted by Thornhill, the poles also look like massive plasma strike areas.

[*Olympus Mons. After NASA.*]

Ralph Juergens in "Of the Moon and Mars, part II (*Pensee Journal* II, 1974) wrote:

"A study of Mariner 9's overhead shot of Nix Olympica suggests that the summit crater on this vast pile is indeed the result of one pit having been superimposed on another, the process repeated at least five times. But the sequence seems to run from larger to successively smaller pits in at least the first three stages, and in every case the later pits appear to be centered on rims of earlier pits. Such a seeming preference of later craters for high points on the rims of earlier ones is strongly suggestive of electrical activity."

What is of interest here is the fact that there were apparently five reignitions of an arc at this location. Other Mons also show repeated ignitions.

Richard M. Smith, in "The Mars Ocean Project," at <http://pages.suddenlink.net/rickmsmith/Mars%20Links/Marsindex.html>, writes:

"In 1989, Timothy Parker and colleagues at the Jet Propulsion Laboratory began analyzing the topography of Mars's northern lowlands for evidence of shorelines that would indicate the existence of ancient oceans."

*"In 2001 Parker and [Stephen] Clifford published a paper that delineated their findings in a map showing the locations of several proposed shorelines. ["The Evolution of the Martian Hydrosphere" *Icarus* (2001)]"*

*"Later, in 2003, [Michael] Carr and [James] Head reported their opinion that more compelling evidence for ancient large bodies of water were to be found in the deposits on the northern plains." ["Oceans on Mars" *Journal of Geophysical Research* (2003)]*

[Mars, northern basins. After Carr and Head; Courtesy of Richard Smith.]

Smith set out to investigate the graphical equivalent of two oceans contained within the proposed shorelines on Mars called Arabia and Deuteronilus. The larger Arabia basin includes the smaller (and lower) Deuteronilus. These are shown above for one instance of some variable parameters, such as the oblateness of Mars due to the additional amount of water.

[\[return to text\]](#)

Note 11 --

That the lower plasma stream would follow the Earth's magnetic field lines is certain. But as Mars approached closer Mars would have centered on the (location of) the pole star, maintaining a path directly aimed at Earth, attracted, as I have pointed out, simply by gravity.

The suggestion from Book 10 of the *Chilam Balam* is that Mars disappeared behind the plasma (or vapor) dome in the north. It reads that Mars "pierced the back" of the mountain or the "foundation stone." This would be correct from the longitude of Central America if the plasma contact with Earth (at that time or at one time) was in Hudson Bay. But the reading could also suggest that visually Mars was seen adjacent to the cloud bank in the North Atlantic.

The *Chilam Balam* also notes that (presumably) Mars "warmed well" the base or pedestal -- again, apparently this is the vapor dome in the North Atlantic. This also suggests arcing from the lower hemisphere of Mars.

[\[return to text\]](#)

Note 12 --

"That conservatism so noticeable in Egyptian art is even more emphasized in matters of religion; elements which had once been admitted into the canon continued side by side with later innovations, even though they were logically superfluous and sometimes irreconcilable."

-- I.E.S. Edwards *The Pyramids of Egypt* (1972).

The conservatism arises from the conviction of the experience of a thousand years of the "Era of the Gods," and some of the strange and diverse elements in Egyptian religion probably have their genesis in the need to account for the objects in the sky in the previous era from 10,900 BC through 8347 BC. These earlier impressions cannot be neglected, despite the extensive intervening time period. The well-established iconography of 3050 BC is retained for the next 3000 years.

[\[return to text\]](#)

Note 13 --

Egypt did not produce narratives until very late, apparently during the Middle Kingdom (2050 -- 1492 BC). The first we hear of the Egyptian story of Isis and Osiris is when it is told by a Greek in the first century AD.

Sumer and Akkad produced a literature, with the earliest copies dating from 2300 and 2400 BC, although frequently attributed to much earlier dates. Most date from after 2000 BC. The

narratives have little sense of the linear historical perspective that we would require. As in Egypt, only the past mattered, and of the past, only the beginning. However, Sumer kept extensive records of commercial transactions and contracts, from much earlier times.

In China the earliest documents are very late recollections. The *Annals of Shu* is a collection of disconnected records from 2300 BC to 600 BC, collated after 500 BC, destroyed in 213 BC, and recovered some 50 years later. This was during the Chou dynasty, 1027 to 221 BC, which had in effect removed all iconography of the religions associated with the agricultural tribes they conquered, and the Chin dynasty, which purged China of nearly all books in 213 BC.

Some of the religious notions curbed by the Chou were reintroduced by the humanist and realist philosophers of the Confucianists (Confucius, 551-479 BC) and contemporaneous Taoists (Lao-tse, 604-531 BC), but the texts were edited to serve the imperial aristocracy. This was an era of classical philosophical development, and we see efforts to tame and explain the world in terms of basic forces in nature (such as the Yin / Yang) and material elements, not unlike the efforts of the contemporaneous Greeks to displace the Olympian Gods with rational thought. This had an impact on the Chinese records that were forwarded to us, for they have been cleaned up and emptied of mythical and legendary elements. Only "heaven" is retained, and heaven is not the home of a god or spirit so much as it is a source of authority.

[\[return to text\]](#)

Note 14 --

Marinus van der Sluijs at [\[www.mythopedia.info\]](http://www.mythopedia.info) reports the following:

"For practically every known rite -- and there are thousands of them -- you can find a natural match in mythology, and in every instance the person who performs the ritual corresponds to one of the actors in the myth, be it the main divinity himself or another one. It is, therefore, justifiable to say that the persons who enact the rituals temporarily become the gods -- in their own imagination -- for the duration of the ritual. The myth and the ritual together form a sort of microcosm that exists outside the ordinary world, but takes place in "illo tempore" exclusively."

"An interesting sidenote is that this insight vindicates the age-old traditional explanation of the origin of the rituals. ... The most sacred rites were worldwide believed to have been instituted by the gods themselves. Here the tradition explicitly connects the myth and the ritual. According to the myth the god performed the sacred act for the first time, so that the myth actually describes the ritual. Conversely, by performing the same sacred act the celebrant repeats what the god allegedly did first, so that the deity automatically becomes the legendary founder of the ritual."

[\[return to text\]](#)

Note 15 --

The earliest Egyptian mastabas and the first pyramids are oriented towards the northwest. Only the first "true" pyramids are aligned north-south. As time goes on temples also are aligned more frequently to the north, but often determined more by the old sacred traditions.

The earlier megalithic constructions in Ireland, England, and France generally have their major axis pointing west by northwest. Only in the Bronze Age do graves and constructions in Europe start to point to the North Pole.

[\[return to text\]](#)

Note 16 --

You will recognize obvious elements in "Jack and the Bean Stalk" and also in many other fairy tales. It might also be suggested that hopscotch diagrams represent the "stairway to heaven" plasma discontinuity. The game is supposedly British and of Roman times, but this only attests to its antiquity. It is in use worldwide. In the USA the numbered squares are surmounted with a circle marked "heaven."

The Roman poet Ovid turned many of the senseless "myths," which often have no resolution in terms of a moral or a lesson, into a narrative form but, despite his best efforts, a sense of closure often escaped him, and the only lesson learned, for example, is that the caprice of youth will lead to being turned into a Laurel tree by an angry Goddess.

[\[return to text\]](#)

Note 17 --

Rohan and Renshaw, *American Journal of Psychiatry* January, 2004. The patent 6,572,528 (applied for April 20, 2001, awarded June 3, 2003), is held by McLean Hospital Corporation, Belmont, MA. The patent speaks of a 1000 Hz (pulse) rate at 5-10 Gauss. Compare this to the Earth's current magnetic field (which does not oscillate) of 0.3-0.6 Gauss.

It would be difficult, however, to imagine a Birkeland current capable of generating a 1000 Hz pulsing field from rotation. The physical dimensions of the arc are too large. The magnetic pulsing would have to be generated by sputtering, or some other by-product of the current.

Recovering the Lost World, A Saturnian Cosmology -- Jno Cook

Chapter 15: The Era of the Gods.

\$Revision: 42.42 \$ (gil.php)

Contents of this chapter: [\[The King List\]](#) [\[Dating the Age of the Gods\]](#) [\[Barrows\]](#) [\[Henges\]](#)
[\[Temples and Platforms\]](#) [\[The Gods Destroy Earth\]](#) [\[Endnotes\]](#)

The Era of the Gods

This chapter will give further details of the "Era of the Gods." I will suggest some dates, discuss megalithic sites in Europe, and describe the flood of 3147 BC -- when the Gods left.

I will be using 3147 BC, as the "end" of the "Era of the Gods." This date is a correction of 3114 BC, the retrocalculated Maya "year zero," which is the start of the second Mesoamerican calendar round -- as understood by us and, in fact, by the Maya of the Classical era (AD 400 to 900). Any number of catastrophists have used the convenient date of 3114 BC, without looking into how correct or incorrect this might be.

The correction to 3147 BC is based on the institution of the Long Count by the Olmecs in 747 BC, and is detailed in the chapter "The Maya Calendar." The date of 3147 BC is probably much more correct than 3114 BC, although both dates generally match later chronologies, archaeological findings, and climatological information. The date also matches a massive setback in Middle Eastern civilization. The setback was caused by a catastrophe which will be recounted 800 years later in the *Epic of Gilgamesh* as "the flood" and retold much later yet in the Bible as "the flood of Noah" and placed in 2349 BC. [\[note 1\]](#)

The King List

The "Era of the Gods" ends in 3147 BC with the World Flood. Two questions are, How long did the Gods rule, and, When did this era begin?

The beginning date of the "Era of the Gods" can be derived from the Sumerian *King List*. Additionally, the span of time the "egg" stood in the sky, before creation, can be found from some variations of the *King List* and both can be partially verified against later Egyptian records. From climatological data we can even determine when the "chaos before creation" started. All of these bear up under archaeological evidence.

I will use the Sumerian *King List* because it provides actual year tallies. The Sumerians and people of Mesopotamia had been keeping extensive records of farm products since 8500 BC. Among the tallies and records which were kept, was a summary list of the names and lengths of reigns of kings, along with the names of the cities they ruled.

The Sumerian *King List* is a text extant from remote antiquity. It was frequently recopied and seems to have had canonical status among the people of Mesopotamia. It was even used by the Bible editors after 600 BC as a record of the world since Creation. It lists 8 "kings before the flood" and then a long list of "kings after the flood," the first 23 at the city of Kish of Sumer, followed by hundreds more at other cities.

The first of the 8 kings before the flood and the first king after the flood both "descend from heaven." It is the flood which separates our era from the "Era of the Gods." The *King List* simply ends the period of the kings before the flood with:

"And then the flood swept over."

The earliest extant copies of the *King List* date from 2300 or 2200 BC, apparently transcribed from records of circa 2800 BC. There are variations among the 18 extant copies, but it is possible to suggest an earlier master copy and to reconstruct it. Accurate copies were known even in Classical times, long after the lands of Sumer and Akkad had been completely forgotten. While the length of the reigns of some individual kings varies among copies, the total length of all the reigns at individual cities always remains the same. [\[note 2\]](#)

The Sumerian *King List* is often held to be nothing more than political promotion and the large number of "years" for the reigns of the earliest kings, as extravagant bragging in the service of some regime. But if we recognize that the first kings are not human kings but represent celestial beings -- Saturn at first, and later the planet Mars which approaches Earth at regular intervals -- then the beginning portion of the *King List* will start to make sense.

The early kings, and especially the "kings before the flood," rule for impossibly long times -- reigns lasting up to 43,000 years. However, the word that is translated by us as "year"

actually means "turn" or "shuttle," as in weaving. It also means "rotation" and came to mean year (as in a "rotation in seasons") as well as a change in government.

The number of "turns" of the "kings before the flood" are all given as whole thousands, making it look suspiciously like they were made up. But, in fact, it seems that the "turns" represent days, likely retrocalculated from years. If the list was transcribed from other records after 3100 BC, the chroniclers must have been aware that the length of the year had changed and attempted to preserve accuracy by using days (turns) rather than years. Additionally, it should be noted that invoices and manifests in Mesopotamia always used the smallest units in recording transactions. Dividing all the numbers by 225 (what I will assume to be the number of days in the year before 3147 BC) makes all the "turns" into whole numbered years and reduces the total time span of the 8 kings from 241,200 "years" to 1072 years. [\[note 3\]](#)

The *King List* notes that Meskiaggasher, the first king (and founder) of the city of Uruk "was the first to write on clay." Meskiaggasher is dated to 2720 or 2740 BC and is the 24th king "after the flood." The "writing on clay" was actually well established much earlier in Northern Mesopotamia, yet for Sumer the credit went to the founder of Uruk. The previous 23 kings had held sway over the city of Kish, north of Uruk. Kish was the center of Sumerian politics for some 300 years.

In about 2700 Gilgamesh, the 5th king of Uruk and the literary figure at the center of the *Epic of Gilgamesh*, defies the king of Kish, and the center of Sumerian politics shifts to Uruk. It was at this time that the *King List* was probably first transcribed from older tallies and records. We probably owe the compilation of the *King List*, which was continued for hundreds of years into the future, to this gesture of independence by Gilgamesh. Independence of the individual cities became the political philosophy and practice of Sumer. [\[note 4\]](#)

With respect to accepting the validity of the *King List*, I think we need to overcome our chauvinism and not assume factual inaccuracy simply because these people precede us by 5000 years. They were not cavemen. The Sumerians showed amazing abilities -- agricultural production, the building and maintenance of massive irrigation projects, the manufacture of goods, widespread conduct of trade, and the ability to keep track of products numbering into the tens of thousands of units.

The tallies of farm products which date back to 8500 BC were initially represented with clay tokens. The use of the token system was extended to many differing trade goods -- barley, beer, cattle, sheep, wicker, cloth, and building materials. Representations of 10 and 100, plus 60, 600, and 3600 were in use. The far-flung trade of Sumer ranged from the Indus valley to the seacoast of the Levant, and, before 3000 BC, to Egypt. There are surviving temple records of trade accounts from 4000 BC. [\[note 5\]](#)

Dating the Age of the Gods

Together the eight "kings before the flood" account for 1072 years. Subtracting this from an ending date of 3147 BC, the "Era of the Gods" started in 4219 BC, a date I later corrected to 4077 BC. The "eight kings" seem to be the appearances of Mars, mentioned previously. Their "rulership" is established because Mars is seen descending from heaven. A version of the *King List* is given below:

"When kingship descended from heaven, the kingship was in Eridu.

- In Eridu Alulim became king; he ruled for 28,800 turns. Alaljar ruled for 36,000 turns. Eridu was abandoned.

- Kingship was taken to Bad-tibira. Ammilu'anna the king ruled 43,200 turns. Enmegallanna ruled 28,800 turns. Dumuzi the shepherd ruled 36,000 turns. Bad-tibira was abandoned.

- Kingship was taken to Larak. En-sipa-zi-anna ruled 28,800 turns. Larak was abandoned.

- Kingship was taken to Sippar. Meduranki ruled 21,000 turns. Sippar was abandoned.

- Kingship was taken to Shuruppak. Ubur-tutu ruled 18,600 turns.

- Total: 8 kings, their turns: 241,200

- Then the flood swept over."

-- MS in Sumerian on clay, 2000-1800 BC

With "turns" representing days in the *King List*, the 8 kings ruled at 128 to 192 year intervals. The reigns have a repetitive regularity. Mars probably descended slowly at 120 to 190 year intervals. Because plasma flows tend to be self-limiting, and thus represent nearly identical flows of current over long periods of time, it is likely that the descent of Mars was very regular. A long interval also fits with the long time spans between the building and use of grave barrows (and henges) in Western Europe (see below). The identification of five different cities probably implies that the strike point of the arc was interrupted and restarted in a new location periodically. [\[note 6\]](#)

The identities and locations of the "cities" mentioned above, in the quoted *King List*, are very uncertain. Based on linguistic rather than archaeological evidence, it would seem that Eridu (the first city of the *King List*) is thought to be Uruk or is located in the far south, Sippar (the fourth city) is thought to be Nippur, and Shuruppak (the fifth city) might be located near Fara. (The "Sumerian Noah" of the *Epic of Gilgamesh* is from Shuruppak -- "City of the Ship.") But linguists and archaeologists work from slim evidence, and I suspect, as others do also, that Eridu is not Uruk. Uruk was not founded until 350 years after the flood of 3147 BC. The last two cities have not been identified at all. It is suspected by some that they may be under the coastal waters of the Persian Gulf. Although Eridu tends to be thought of as real, many archaeologists hold that none of the cities have been identified.

When the *King List* was being compiled (after 3147 BC), there had been walled cities in Sumer for perhaps a thousand years and the cloud or plasma formation at the north horizon was thus recognized as a walled city. This was probably the formation and disappearance of the cup-shaped "mountain" at the base of the plasma stream near Earth, caused by instabilities in the plasma stream from Saturn (as could happen with changes in the separation of the planets). To the Sumerian chroniclers, compiling the records of the past, the equivalent of what had been seen at the north horizon was the existence of cities, kings, and changes in kingship. [\[note 7\]](#)

When The Egg Appeared

Now we take another step back in time. At the very beginning of some versions of the *King List*, and preceding the eight "kings before the flood," is Alorus, a king who does not descend to Earth but rules in heaven for an inordinately long time -- 162,000 "turns." Assuming again that a turn is a single day and using a year of 225 days, Alorus would have ruled 720 solar years. The reign of Alorus in Heaven must represent the condition before the "creation event," for there is no mention of his descent to Earth, whereas the next king is preceded with the phrase "When kingship descended from heaven ..." Alorus must represent the time when the egg stood in the sky, and presumably before Saturn lit up and Mars started periodic descents. For a long time nothing happened -- 720 solar years (representing 443 of our current years). [\[note 8\]](#)

Subtracting 720 years from 4219 BC we arrive at 4939 BC as the first appearance of Saturn as an egg in the clouded sky. (Or, subtracting 720 years from 4077 BC, the result is 4797 BC.) I had suggested in the previous chapter, based on climatic data, that Earth originally arrived at a location below Saturn at circa 5800 BC. This is not correct, since Earth had been below Saturn since 10,900 BC. The cloud cover of the Younger Dryas may account for the lag in climate.

But we now make the additional suggestion that Saturn remained indistinct until 4077 BC -- shrouded in turbulent clouds or what looked like a sea of swirling water. In 4077 BC Saturn went nova, and all the surrounding glow mode plasma disappeared suddenly.

Thus we have the following sequence:

- Arrival of Earth below Saturn, circa 5800 BC.
- First visibility of Saturn as an egg in 4939 BC (or 4797 BC).
- Saturn goes nova -- the egg opens -- in 4219 BC (or 4077 BC).
- The end of the "Era of the Gods" in 3147 BC.

[\[note 9\]](#)

The details of the sequence of events when Saturn went nova were given in the previous chapter. Note again that, as far as most humans are concerned, it is the nova event that

determines "creation." There was no thought of the creation of humans or of anything dealing with Middle Earth. The only concern was to mark the creation of heaven and the self-creation of the Gods.

Barrows in Western Europe

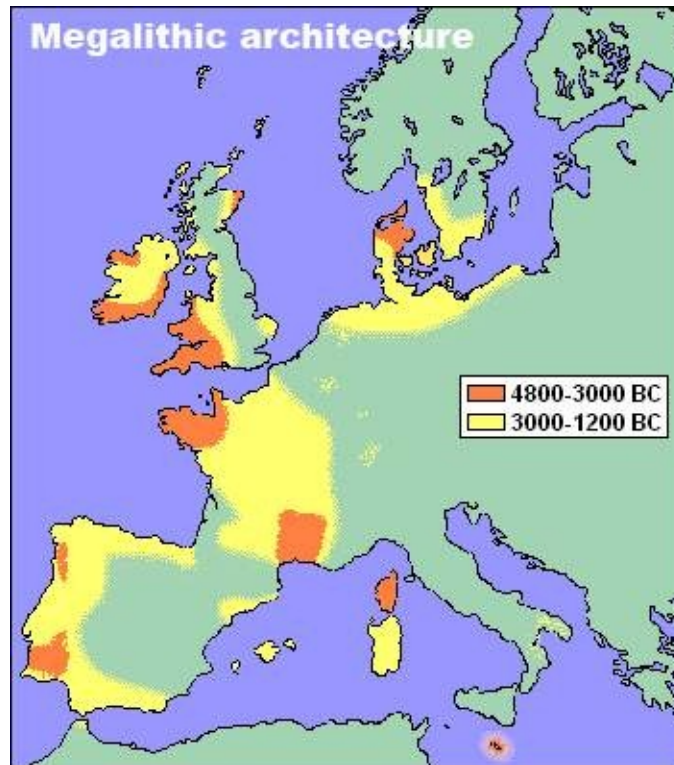

The Egyptians and Mesopotamians, who were eventually to build gigantic stone and brick monuments, left nothing but a few postholes and wall foundations from the "Era of the Gods." It is in Western Europe, from Portugal to Sweden, that people start a frenzy of building very large grave mounds, called Long Barrows, followed by hollow megalithic mounds, called Passage Graves, and later yet open circular megalithic structures, called henges, during and after the "Era of the Gods." [\[note 10\]](#)

The Long Barrows are 100 to 200 feet (30 to 70 meters) long and half as wide, made at times with standing stones, often 8 to 10 feet (3 meters) tall and capped with stone slabs weighing up to 40 tons. These are covered with packed earth to form a large mound, often much larger than the internal space. The barrows have long passages in the interior with a single terminal chamber at the end. But not all Long Barrows do. Some, like West Kennet Long Barrow (England), are composed almost entirely of a mound of dirt, with very little dedicated as an enclosed burial space. The Long Barrows tend to be older, by thousands of years, than other structures, called Passage Graves.

The Long Barrows date from 4000 BC through about 3400 BC. There can be little question that these barrows are in imitation of the giant ball plasmoids seen in the far south, last seen in 8347 BC. They are also generally oriented with the long axis pointing to the south or southwest. The concept that a huge mound of dirt, or a hollowed out barrow is required for depositing the bones of the dead will extend far into the future. The idea will be modified a number of times, but the "barrow" idea will remain, even after 2400 BC, when large constructions have stopped almost everywhere.

The Passage Graves appear a thousand years after the Long Barrows, after 3400 BC and 3100 BC, and continue to be built until circa 2400 BC. If the Long Barrows seem to be modeled after the ball plasmoids in the south, so the Passage Graves seem to be modeled after Saturn in the north sky.

Then, after about 2500 BC (I would suggest after 2350 BC), the large communal barrows are replaced by single graves under heaped-up soil, called Round Barrows.

[Image: Megalithic architecture; after Tharkun Coll, Wikipedia.]

Ron Wilcox writes about the confusion of barrows (originally at http://www.archtext.co.uk/onlinetexts/britains_past/):

"... barrows are frustrating to archaeologists because they are so varied that they defy classification except in very broad (and probably rather meaningless) categories. The mounds might be long, trapezoidal, ovate, rectangular, or oval while the chambers underneath can be made of wood or megaliths (large stones) and constructed in a variety of plans. Entrances can be at the sides or at the ends or in the case of the earthen long barrows entirely obliterated by the heaping up of the mound."

This should be extended to dates also. Although I have indicated a range of dates for "types" of barrows, these are not at all hard and fast. The confusion of dates extends to the mixing of calibrated and uncalibrated Carbon-14 dates.

The Passage Graves have paired chambers left and right, up to six pairs. Most of these grave structures have an additional low exterior wall surrounding the mound of dirt. All have a clearly marked entrance with a doorway and closing stone, even in later designs which no longer allow access to the chamber. Many use a porthole as the entrance, either a single large stone with a round perforation two feet (2/3 meter) wide, or two abutted stones with semicircular cuts.

There are over a thousand barrows along the east coast of Ireland, the west coast of Britain, and the coast of Northern France, most often in areas with a clear view of the western sky.

There are about 2400 in total in Western Europe. The concentration of barrows in Ireland and England is unusual. The east coast of Ireland and west coast of England were used to allow ocean access, directly from France. This can be easily understood, since these were very large construction projects, much larger than a local population of farmers would have been able to support. Water was the highway of antiquity. It allowed large numbers of people to congregate easily, both during construction and for the intended ceremonies. The east coast of Ireland and west coast of England had easy access from the projecting tip of France while providing protection from Atlantic storms.

The ocean travel reflected the attempt of the continental people of Western Europe to come closer to the strike point of the arc or plasma stream in the Northern Atlantic.

There are barrows inland also, mostly in coastal France. The earliest are at Carnac, France, along the Brittany coast. It is this Northern European stone-age culture which apparently started the fashion for barrows. The barrows spread elsewhere in Western Europe, but mostly to coastal regions with river access. After 3000 BC they spread to the Mediterranean and the Middle East, and eventually to India. The building of barrows lasts until 2400 BC.

Building on this gigantic scale, especially for the dead, had never been done before. There are older cemeteries belonging to settled towns, as in Egypt and Mesopotamia. But generally, where we have cities and permanent houses, the burials were below the floors of houses, after exhumation. The Northern Europeans at this time were hunters and slash-and-burn farmers. They had no cities, and at best only scattered housing. What did all this construction mean?

First let me outline the problems in understanding these constructions. The number of people buried in barrows do not add up to the size estimated for the workforce needed to build the barrows, and thus to the number of people who may have been expected to use the facilities when they died. This is an enigma which has frequently been noted by archaeologists. Except for a few instances of ossuaries for thousands of bones (as at Malta, for example), even a hundred skeletons would be insignificant in representing the dead of a spread-out community of a couple of hundred slash-and-burn farming families, especially for a period of a thousand years. We do not find hundreds of skeletons. The very large West Kennet Long Barrow, near Avebury henge, built around 3700 to 3600 BC, contained 46 burials (individuals of all ages) when investigated in the last century. West Kennet was in use for a thousand years before the "Beaker People" closed it up during the construction of the nearby Avebury henge (the Avebury ditch dates to after circa 3300 BC; the standing stones to circa 2600 BC).

There are other earlier European locations of barrows: Portugal 4500 BC; Barnenez, France 4700 BC; some Carnac mounds are dated at 5800 BC. Early barrows in Portugal and France face (or parallel) the Atlantic ocean, and are thus aligned to the southwest, pointing to South America. I have other estimates for the first Carnac mounds at 4500 BC, with two larger mounds dating from 4000 BC and 3500 BC.

Some of the very large Long Barrows are of early dates, 5800 BC and 4500 BC (as at Carnac and Barnenez, France), and likely represent the ball plasmoid above the South Pole during an earlier era, especially when these seem to face or parallel the Atlantic, rather than being oriented to the northwest. That means that the ball plasmoid was understood as a destination for the dead, something I have suggested in the chapter "The Peratt Column," with respect to the "sweepers" of the beams of electrons.

And there are other graves. Thousands of ground burials with small mounds still covered Denmark in the 19th century. These are the interments of Neolithic farmers, some of which are contemporaneous with the larger barrows. The same grave goods appear in both.

[\[note 11\]](#)

Most of the barrows do not show signs of frequent use. It looks like many sites were reworked, or new interments were made in total disregard of older interments. In many instances old bones were merely swept aside to reuse the tomb.

The barrows may not have been graves at all. It is quite possible that the few skeletal remains actually are sacrifices performed at infrequent intervals. In some locations there are grave goods consisting of arrowheads. In later locations there are collections of celts, certainly many more than would be required for the afterlife. The grave goods (including occasional domestic animals) may be gifts to the Gods, along with the bones of the humans. The barrows may have simply represented attempts to pacify the Gods with sacrificed humans. I have no idea if this is correct, nor does anyone else.

Wilcox is able to suggest that the burial practices involved excarnation, after which the skull and long bones were deposited in a barrow. All the small bones of the body would have been carried off by scavengers. Wilcox writes:

"Remains of what is thought to have been an excarnation platform where dead bodies were exposed ... have been discovered at Stoney Middleton in Derbyshire [and other locations]. The platform ... was surrounded by a semi-circular wall with three standing stones by the entrance. Hundreds of human teeth and bones have been found at the site together with the tiny bones of small animals such as frogs and rodents, which are thought to have been deposited at the site in the droppings of owls and other birds of prey attracted to the decaying human flesh. The excavators suggest the site was built circa 3000 BCE and remained in use for some 1000 years."

Wilcox suggests that ultimately the barrows are territorial markers.

"Associated with causewayed enclosures [not the giant cursuses] and perhaps constructed by groups of people (septs or small clans) who cleared and farmed in adjacent small areas are mortuary enclosures and barrows. Professor Colin Renfrew, who has studied megalithic stalled cairns (barrows) on the island of Rousay, identifies each barrow with an adjoining territory belonging to an individual sept. The cairns not

only served as places where excarnated remains (skulls and long bones) could be deposited after exposure but also as markers of the sept territories on which dwelt the people whose ancestral remains were stored within them."

It seems excessive, and "ownership" seems like a contemporaneous notion. This is of course pointed up by the fact that almost universally the barrows get very little use. Some are in use only a decade, some others last a few generations. Yet even for this last case, the number of inhumations falls far short for a clan which could have built the barrow and farmed near by.

To undertake building a Long Barrow or Passage Grave, a crew would need to be fed. The farmed plots adjacent to barrows remind me of the circumnavigation of Africa in about 600 BC by a Phoenician crew, who:

"... every autumn put in at some convenient spot on the Libyan [African] coast, sowed a patch of ground, and waited for next year's harvest. Then, having got in their grain, they put to sea again...." --Herodotus, Histories 440 BC.

It seems very likely that the islands of Malta in the Mediterranean, Bahrein (Dilmun) in the Persian Gulf, and Cozumel in the Caribbean were each used as island cemeteries equated to the original ball plasmoid of the south which had been seen in the ocean of the Absu. Britain and Ireland may similarly have functioned conceptually as island cemeteries, after 8347 BC. Apparently the 10,000 BC site of Gobekli (Göbekli) Tepe in Anatolia, currently under excavation, was also a mortuary. [\[note 12\]](#)

Whatever their function, it seems clear that the later barrows (the Passage Graves) were built in imitation of the "city of the Gods" seen on the northwest horizon -- the giant cloud bank, the polar plasma stream above it, and the globe of Saturn and its rings above that. The barrows are complete models of this structure.

Of the later barrows, many have buttressed or scalloped exterior walls in imitation of the fluted water vapor cloud bank. In the interior of the earlier Passage Graves there is a long passage leading up to a room, but at times to two rooms side by side. The interior looks like a plan of the polar plasma stream, as a path terminating in the disk and rings of Saturn. The exterior entrances of the barrows often repeat the same design with porthole entrances flanked by stones shaped like spread wings.

Later versions of the Passage Graves feature additional rooms arranged left and right, but always at the end of a passage which is much too long to have any utility. The repeated branching of chambers in pairs off the main passage looks like a plan view of the "tree" form of the plasma instability which had shown up in earlier petroglyphs and as the later Mesopotamian cylinder seals depicting the lobe-leaved "tree of heaven" with a globe at the very top -- the terminal room of these graves. [\[note 13\]](#)

There are other hints that the barrows were built in imitation of what was seen at the far

northwestern horizon. The barrows in Ireland and the west coast of England are almost always aligned to have entrances facing southeast. Archaeologists think this was done to allow the midwinter sunrise to enter the structure. But only a few late barrows do this, although perhaps by accident. Most constructions clearly miss the mark. The west-northwest by east-southeast orientation actually points the barrows to Greenland. A location near Greenland was the center of the plasma strike under way some time after 4077 BC. With few exceptions, all the monuments of France, England, and Ireland point to the center of the strike point of the plasma at the shifting location of the north magnetic pole, and thus to the center of the cloud banks seen in that direction. This accounts also for the fact that the alignments tend to wander from a single compass point. [\[note 14\]](#)

Most (but not all) of the parallel rows of stones in Brittany, which apparently precede any of the other stone henges and their access causeways in Western Europe, are aligned to the southwest, but almost all the passage graves, some of which are also assigned early dates, are aligned to the northwest, and dated from 4410 BC to 3360 BC. Only the earliest barrows at Carnac are aligned to the southwest.

This change in alignment is a change in the direction in which the primary objects of interest were seen. First the plasmoids in the southwest direction, then the cloud bank and Saturn in the northwest.

The barrows may represent the first association between death and an afterlife, where an afterlife is guaranteed through proper burial. It is interesting that in early Roman times the people of Western Europe (and throughout Central Europe in Roman times) believed in a return to life after death, whereas the Romans and Greeks did not.

The most prominent feature of the barrows is the persistent doorway, and may yield an answer as to why these projects were undertaken. The doorway suggests an interior space, even when the interior space is no longer present, as in some later barrows. Because the Western Europeans saw a dozen much smaller orbs following Mars like ducklings (identified as knots in the plasma stream, noted by Talbott) as Mars moved back toward Saturn, these people may have understood that the approaching God Mars had come to collect the dead. The cloud bank at the northwestern horizon was thus understood as a house -- perhaps a charnel house where bones awaited transport to the upper home of the Gods. Most likely the earliest barrows were simply intended to duplicate the mountain at the horizon, with the porthole as the entrance to a cave in the mountain. [\[note 15\]](#)

It could also be suggested that the lowering of Mars was seen as a threat. The lowering of Mars to the vicinity of Earth, so that it looked like a giant red globe suspended in the sky, would have been accompanied possibly by earthquakes, certainly by changes in the tides, and of course massive lightning discharges. It is likely that the approach of Mars could be seen in progress for decades.

If Mars came close to Earth, it would approach along the axis of the Earth's North Pole, not

the location of the cloudbank in the Atlantic. The plasma stream from Saturn would most likely follow the upper path of Mars, and bend to strike Earth at the north magnetic pole. Mars would remain above or behind the cloud bank. The Maya *Chilam Balam* suggests "behind." But this is from the perspective of 15 degrees north latitude in Central America and 90 degrees further west in longitude.

The barrows may have been a preventive measure meant to induce the God to leave again with the bodies as sacrifices meant to appease the God. [\[note 16\]](#)

The portholes of the barrows, flanked on occasion by wings cut into the same stone slabs, also suggest the circular disk of Saturn, with its flanking rings, just as the long interior passageways and the terminal room with the dual chambers on both sides duplicate the image seen in the sky. The places of sacrificial offerings were built on the only model at hand -- Saturn in plasma discharge to Earth.

We should expect most of the barrows to have been built between 4077 BC and 3147 BC, for it is only in this period that the God Mars descends to Earth at intervals. And in fact we see very few barrows constructed before about 4000 BC -- some might be misdated, but others would be copies of the southern plasmoid at the end of the Peratt column, rather than the form in the northwest. Construction falls off rapidly after 3147 BC. (But construction picks up again after 3000 BC; I will describe this in the next chapter.)

The infrequent construction and infrequent use of the barrows might be the result of the 120 to 190 year interval between approaches of the God. The lack of bodies would make sense if the trip to Heaven were reserved only for selected people, leaders, priests, or sacrificial victims. The lack of respect for earlier remains in the barrows would be accounted for if some sort of transformation -- a stellation, for example -- were to be assumed for the dead, or if earlier sacrifices were meaningless 120 years later. As time progressed (hundreds of years), the use of later barrows (in the Neolithic and Bronze Age) seems to have been extended to larger groups. It became a funeral business, as at Malta. [\[note 17\]](#)

In the 1920s the idea of a "missionary" religious sect was proposed to account for the fact that the dolmen and megalithic barrow structures are almost identical throughout Europe and the Mediterranean. The suggestion was that the religious ideas were spread by proselytes from the Eastern Mediterranean region moving west across France and around Spain to eventually reach England and Scandinavia. This idea has not held up under archaeological dating. I propose the opposite: the idea of a house of the dead spread from western Europe to the Mediterranean and may have influenced Egyptian graves and temples after 3000 BC. Based on archaeological dating, it looks like the use of large barrows moved from Portugal north to Carnac, and then west to England and further west to Ireland. Each move brought the ceremonies ever closer to the home of the Gods seen in the northwest sky. [\[note 18\]](#)

I should add a note on cursuses. These are absolutely giant enclosures of land, marked off by dikes and exterior ditches. The dikes consist of two parallel banks about a foot (1/3 meter

)high, but 20 feet 6 or 7 meters wide, with a ditch outside of these. From Ron Wilcox:

"Cursuses are a type of monument that is not at all well understood and have remained an enigma for many years. We know they date from the Neolithic period and that they are one of the most common of Neolithic monuments, with over 150 so far identified [in England]. Some excavation has been carried out on a few of the best-known. The Stonehenge Cursus which, like other examples, is a lengthy enclosure, measuring some three kilometres long [two miles] with enclosed ends where the banks are at their most obvious, varies in width from 100 metres to 150 metres [325 to 480 feet]. Its bank is about 6.5 metres across and 0.4 metres high [20 feet by 1 foot] dug out of a ditch of comparable size and is dated to between 3600 and 3300 BCE. A smaller cursus lies not far off."

All the cursuses are very long and narrow tapered enclosures, generally with the dikes at one end closer together than at the other end. In general this seems like a purposeful adoption of a diminishing perspective, yet for many cursuses the far end cannot be seen from the near end. Many cursuses also change direction abruptly at some center location, or start to curve away from their initial direction.

"The largest-known cursus is the Dorset Cursus running for 9.6 km [6 miles] from Bokerley Down to Thickthorn Down (Atkinson). Its banks are about 91 metres [296 feet] apart and, like the Stonehenge example, has enclosed ends. Investigations have shown that it was built in two sections and this seems to be a feature of cursuses that they are constructed in incremental additions, not all at the same time, rather like a medieval church. Incorporated into the Dorset Cursus are long barrows that suggest to some that the monument may have had a relationship with the ancestor cult."

I should point out also that there is no apparent dominant orientation. Even cursuses close together will point to odd compass directions. A few point to large standing stones; some are associated with long barrows; more than a few have interments at the bank of the slimmer end. All of them were also augmented -- lengthened -- from time to time.

"Dates for cursuses seem to range from circa 3600 BCE to circa 3000 BCE," writes Wilcox. The early dates, plus the complete lack of any primary orientation, relates the cursuses to the Ley lines, which also lack any coherent orientation. If the cursuses are indeed dated to 3600 BC (most date from between 4000 BC and 2500 BC), then they date from the 4077 BC nova event of Saturn, and extent to the end of the period during which barrows were built.

Ley lines, on the other hand, seem to be later in the Neolithic, for they are all too frequently associated with monuments (standing stones), graves, graveyards, even Christian churches. And Ley lines seem to relate specifically to the landscape, as if at that point in time the landscape is occupied and owned.

What becomes clear in all this is that the British Isles must have been known in Western

Europe as the Islands of the Dead. (Procopius, in *Gothic Wars* AD 565, confirms Britain as "the home of dead souls.")

Henges

Henges and causeways also precede any of the gigantic building projects of Egypt or Mesopotamia. Their construction starts in Western Europe after 4000 BC (only a few) and lasts to 3000 BC (and later), thus spanning the "Era of the Gods." Henges are not grave sites. William Stukeley, in *Stonehenge, A Temple Restored to the British Druids* (1740), notes at least 50 barrows in sight of Stonehenge. To have barrows near other Neolithic monuments is true almost everywhere in the British Isles.

The henges are public structures, perhaps equivalent to the temple platforms constructed of dried mud bricks later in Sumer. There are some 120 known henges in Britain. The only signs of activity at the henges are the remnants of occasional feasting. The material used in building henges varies with what was locally available -- trees in some Central European locations, large glacial boulders in Western Europe, and, in some cases, as at Stonehenge, dressed stone. Compared to the barrows, they are enormous undertakings, supposedly requiring a vast labor force. [\[note 19\]](#)

The henges are circles of wooden posts (frequently two or three feet in diameter, up to a meter) or standing stones, at times set in concentric circles and always with an exterior ditch. Again we seem to encounter an imitation of the planet overhead in plasma discharge. Anthony Peratt claims that the postholes of the original Stonehenge site (a circle of 56 posts) replicates a stupendous plasma discharge -- presented as a sort of tubular "aurora" of a very limited diameter which extended millions of miles into space. These were electron bundles in arc mode, not excited Oxygen ions, as is typical of auroras.

The count of 56 posts or stones or markers is found repeatedly in almost all other henges, pecked cliff markings, and even the Big Horn Medicine Wheel in the Big Horn Mountains of Wyoming, in the USA. The posts (or stones in other henges) represent a view directly up into the plasma stream at the location of the bend in the stream, away from the north magnetic pole, which was, as Peratt has pointed out, the terminal point of the 56 bundles of concentrated plasma at the outer edges of the stream. The division of the plasma stream into 56 (or 28) bundles is an inherent feature of concentrated plasma discharges.

The view of the plasma stream -- looking like a circle of blazing lights -- was afforded anywhere where a view directly up into the plasma stream was likely. This might be a view of the plasma column as it left the overhead planets, or a view at the bend in the stream where it realigned its direction of travel to meet the magnetic pole. There would be a bend because the connection between Earth and Saturn rotated in the sky on a daily basis -- "like a swizzle stick" reads Vedic sources. [\[note 20\]](#)

Some henges have causeways which lead up to an entrance and are also edged in standing stones. These represent the column of plasma extending from Saturn to Earth -- the path leading to Heaven. The concept of a "path" from Earth to some objects in the sky had been established long ago. Note that none of the causeways are straight, all include a curve, resembling the plasma stream between Saturn and Earth, which, on nearing Earth, curved away from the direction of the polar axis to make contact with the north magnetic pole.

[\[note 21\]](#)

There is no doubt that the three long causeways at Carnac represented the Peratt Column seen extending from the South Pole. This was discussed in the chapter "The Peratt Column." The fact that some shorter causeways are aligned toward the northwest, rather than the southwest, suggests that the first sight of the polar apparition above the North Pole of Earth followed directly after the south polar column disappeared. (This may not be true.)

The two largest henges in England and Ireland date as follows: Avebury 3300 BC (the ditch; the stones followed 700 years later), New Grange 3200 BC. The Carnac "Grand Menhir," mentioned earlier, is a single 90-foot standing stone, also dated from 4000 BC. It is probably the largest stone ever set up.

What did the construction of stone henges (and rows of standing stones) mean? First of all, as I have noted, I believe they were made in imitation of what was seen in the sky, a round orb in plasma discharge. But it also looks as though efforts were being made to harness displays of Saint Elmo's fire.

The arc touching down in the North Atlantic after 4077 BC must have built up the Earth's static electricity and caused an electrically charged atmosphere. Any tall pointed object would arc with Saint Elmo's fire under the right conditions. This was seen as the doing of the Gods and, in imitation of the arcing circle in the sky, structures were built that would blaze with a similar ring of fire.

Even today any high pointed object (like a ship's mast) will discharge with a flickering blue flame during an electric storm. This is the result of introducing a ground potential into a location of higher elevation where it would experience a voltage difference easily measured in hundreds of volts per foot. (And particular to pointed peaks.) The almost ubiquitous ditches surrounding the henges add to the effect since they increase the electric potential and could be filled with water to wet the surrounding ground -- making the ground plane more conductive.

Location was everything, and in Western Europe the location of henges and barrows seemed to have involved three factors. First, a clear view of the western or northwestern horizon was needed with visual proximity to (and visibility of) the strike point of the plasma arc in the North Atlantic, or the dome of water vapor.

Second, easy access from the sea, via a river, to allow for the arrival of people for the

purposes of construction. [\[note 22\]](#)

The third factor was the existence of a conductive plane. This would be a matter of selecting a region which had sufficient (and proper) minerals to allow the ground to readily assume an induced (negative) charge with the occurrence of an overhead positive charge (or the exact reverse). The need for a conductive ground plane is most vividly demonstrated with Saint Elmo's fire when it occurs on ships today, for they float on a highly conductive electrolytic solution -- the salt sea. [\[note 23\]](#)

The third factor also explains another reason why we see megalithic constructions clustered together on the west coast of France (near the ocean), in Central England, and on the east coast of Ireland. Separate stone henges and causeways are at times dated a thousand years apart yet built in close proximity. The locations are on the lee side of higher ground or mountain ranges or, as in France, a low coastal area. During westerly thunderstorms these areas would experience an electrically charged atmosphere overhead more frequently than other locations. Besides the Saint Elmo's fire, there would also have been many lightning strikes out of the clear blue sky.

The henges, like the barrows, seem to show very occasional, rather than continuous, use and are often abandoned for new constructions. This suggests that festivities were very infrequent, yet the work involved in the construction was enormous. Something very important was being celebrated. [\[note 24\]](#)

However, after having been in disuse for a thousand years or more, the reasons for their construction were forgotten and they may have been seen only as some sort of holy place from antiquity and were used for occasional interments. After 3000 BC there are additional henges built, including many which served no purpose except to duplicate the past. The frequent reconstructions of Stonehenge extend over a period of 1500 years after 3100 BC.

The henges and causeways should be distinguished from the thousands of barrows and ossuaries, but since the graves are constructed both earlier and during the same time period in parallel with the public monuments, the combined effect can be very confusing. One author notes the variety of origins as "inspired by outside influences." I would suggest that nothing was built in prehistory which was not done in imitation and that a connecting thread can be seen in the variety of construction if we look towards the sky. The structures were built in imitation of the home of the Gods. [\[note 25\]](#)

After 3147 BC the static electricity in the atmosphere declined enough to make wood and stone henges ineffective in triggering a display of heavenly fire. As air moisture lessened, ground water dropped, and wooden posts dried out, other means for these spectacular displays were required. At Stonehenge in England a late desperate effort included changing the stones to a blue rock (transported from 200 miles away), on the presumption that blue rocks would cause blue flames, but they were soon discarded and much larger local gray sandstone slabs were substituted. [\[note 26\]](#)

The Egyptians resorted to massive stone pyramids for the lightning displays and the Mesopotamians built multi-storied ziggurats to achieve the same effect, both started after 2700 BC. The stone henges and causeways would remain sacred to future generations, but no new structures of that type were seriously attempted after 3000 BC with some exceptions. Their day was over. (I'll deal with later barrows, the endless reconstruction of Stonehenge, and further henges in the next chapter.)

Temples and Platforms

In Egypt and Mesopotamia, as elsewhere, the descent of Mars was understood as a visit to Middle Earth by the God. Temples and platforms were constructed to receive the God, with the courtyards and entrances facing northwest. The first temple at Jerusalem, built by Solomon, faced 6 degrees west of north. [\[note 27\]](#)

Temple orientations are not at all uniform, partially because most of the archaeological records date from antiquity. The functions of temples were entirely different from the mastabas and grave sites which, even later, continued to be oriented toward the northwest.

Mars would appear to get larger as it dropped below Saturn, and would follow the centerline between Saturn and Earth, being governed by gravitational forces, and would not be electrically or magnetically nudged. Visually, Mars would therefore travel in a spiral in dropping closer to Earth, looking as if it escaped Saturn altogether.

Mars would not follow the path of the plasma stream to the Earth's north magnetic pole, but rather the plasma stream would follow the location of Mars. Plasma streams do not move objects. Talbott has recorded how Mars would have looked when it went off axis (moved away from the center of Saturn).

Although the plasma stream took a bend in its travel to make contact with Earth's magnetic north pole (starting maybe some 30 or 40 Earth diameters above Earth), Mars would not slip away from the Saturn-Earth axis. It is also doubtful if Mars approached any closer than 20 Earth diameters (160,000 miles -- somewhat closer than the Moon). At that location all of its features would have been clearly visible. From anywhere in the world Mars would also have looked to hover over the location of the Earth's North Pole. Any object located above the north geographic pole of the Earth would visually be seen as standing still at the pole star. This location is considerably displaced from the circle in which Saturn revolved around the pole.

As I have pointed out, it took a minimum of 120 years to complete a lowering to Earth and a return to Saturn. Humans had plenty of warning that Mars was about to visit again. As Mars stopped in its travel toward Earth and reversed direction after some months, the efforts on the part of humanity were rewarded with this apparent warding off of the planet.

Mars would have approached close enough to be seen as a giant globe above the north horizon, but of course we actually have no idea how close Mars came before reversing and moving up again toward Saturn. I don't know why this happened. No one does. It certainly is not due to Mars stopping in its descent when the electric repulsion between the planets equaled the gravitational attraction.

Mars would have been seen to stand still above Earth at its lowest descent because Mars rotates at the same speed as Earth. The plasma stream, which at various times in the "Era of the Gods" was probably in glow mode, followed and enclosed Mars (this shows in the white and red crown of the pharaohs of Egypt), then bent away toward the Earth's north magnetic pole. From the earliest Egyptian iconography we could thus guess that late in the "Era of the Gods" the plasma stream was in glow mode rather than arc mode. [\[note 28\]](#)

The previous chapter described how the plasma streamers from Saturn, when impinging on Mercury would form a star within the crescent of Saturn. If Mercury deviated from being directly below Saturn, the star pattern would be offset to make it look more like a seashell instead. The change in the look of Mercury is not due to a change in perspective, because the distances involved are just too great. It is more likely that Mercury (as with Mars) periodically deviated from its position directly below Saturn.

The first temple buildings, made of wood and built as houses, were constructed in Central Europe among the first Neolithic farmers, the people whom Gimbutas calls the "Old Europeans." Gimbutas also points to some 50 miniature temples which, like the figurines, were probably modeled on Saturn ablaze in the sky. The miniatures are almost always on short stilts, have open fronts, and include a wide porch like the lower rings of Saturn. Many include the furniture -- ovens, seats, fire pits, and tables -- which are the furnishings of houses and became the fittings of full-scale temples. Many of the model temples are populated with tiny figurines -- probably representing the satellites of Saturn. [\[note 29\]](#)

There is clear evidence from Sumer and Egypt of platforms and temple enclosures (circa 4500 BC for the Ubaid city of "Eridu" in Mesopotamia). In Sumer the temple buildings start as large rooms equipped with niches and what looks like an offering table very similar to Central European designs, and soon become large compounds with enormous buildings apparently used as work areas and for storage.

The God is understood to be a local visitor living with the humans. In Egypt and Mesopotamia, as probably elsewhere in the settled world, local images or statues were kept as the presence of the God. These statues were not "representations" of the God -- they were universally understood to be the actual God. People everywhere identify *their* local temple as the home of the God. The name of the God varied widely from city to city. [\[note 30\]](#)

The localization of the Gods is a direct response to what was seen in the skies. In that the image above the North Pole mostly remained in one location, even with Mars periodically lowering, it was visually seen as "directly above." Thus any occupied space on Earth was

understood as "directly below."

The columned porticos of the later Egyptian temples, facing north, are thought to represent the papyrus-forested Nile delta through which the God, or Gods, had entered the country and the temples. The Egyptian Gods were recognized even in antiquity as coming from the north, traveling via the Nile. We are told this at the time of the Greek occupation of Egypt after 315 BC, but the columns were as likely to have been intended to imitate the many-columned plasma path to the Upper Land. The plasma stream from the Upper Land was certainly equated with the Nile. [\[note 31\]](#)

The priesthood throughout Mesopotamia and Egypt establishes an economy based on maintaining the temple of the God or Gods. Food was offered and the statues were walked, washed, and dressed. Far-ranging trade eventually results from the needs of the temples.

Among herders and dispersed farm populations, the offering altar consisted of one of the "high places" to which the Bible makes frequent reference. With the upper atmosphere supercharged with electricity, the effect could be impressive. The God would light the fires with a lightning strike and consume the smoke from the burning fat as it ionized to rise directly into the sky. The following is Elijah in action in about 900 BC:

"The opposition builds its fire, places its offering, dances about, and gets no response. Elijah builds an altar of stone, places his offering, and then pours twelve barrels of water upon the offering. He douses the offering thrice. He digs a trench around the altar and fills it with water."

"The time is approaching evening. The water soaks down and makes contact with the water table. The approaching thunderstorm is preceded by a heavy, moist, ionized, and charged lowering atmosphere. The fire of Yahweh descends upon the offering of Elijah. His triumphant followers escort the prophets of Baal to a nearby place and kill them."

-- III Kings 18, narrated by Alfred de Grazia in *God's Fire* (1983)

The Gods Destroy Earth

The theater in the sky comes to a sudden end in 3147 BC. Earth experiences a violent disturbance which brought the civilizations of the Earth to a stop with a massive flood, except on highlands in Mesopotamia (as in Persia and Anatolia), the foothills of the Himalayas, and in protected river valleys (as in Egypt). Floods and the return of a colder climate are noted in the archaeological and climatological records.

The year 3147 BC marks the worldwide flood. It is the flood which generates stories all over the world of survivors in arks or boats or canoes. In flood tales throughout the world, nearly all the boats or canoes moor to a high mountain peak. The "mountain" is a celestial apparition

dominating the skies directly after and for an additional 280 years. It is Jupiter in plasma discharge to its surroundings from its south polar region.

Among farmer populations, the stories tell of arks provisioned with seeds and farm animals, an event actually experienced earlier by the people fleeing the Black Sea flood of 5600 BC. The Black Sea flood story had been carried far afield with the diaspora of the survivors, who show up in Eastern and Central Europe, Central Asia (as far east as the border of China), Mediterranean Europe, Anatolia, and of course in Mesopotamia between 5400 and 3000 BC. The Black Sea survivors were farmers and fishermen, and thus generated a hundred stories of family, farm animals, and seeds saved aboard a multiplicity of boats. It is only from the casual references in Mesopotamian documents to a "flood before the flood" that we know that the Sumerians understood the repeating nature of worldwide floods.

Yet another worldwide "flood event" would happen in 2349 BC. This also was understood as a major flood. The Chinese *Annals of Shu* report that it took Yu, in the service of the emperor Yao, nine years to empty the mountain valleys of water from the "inundation which overtopped the hills." Yu is dated to around 2200 BC. The "legendary" Yu is traditionally placed as reaching the throne of the Xia dynasty in 2205 BC. The Xia lasted to about 1750 BC. The Chinese "flood event" is dated to approximately the same time as the Noachian flood of the Bible, but neither of these were floods. It was a period of extreme rains and hurricanes. More on this in a following chapter.

The whole issue of "flood" is complicated by the fact that similar events are likely to be collapsed in memory, especially when these happen at the infrequent interval of one or two thousand years. People will always think of the last flood as "the flood," and the image will merge with previous memories into a composite.

This was true for the Hebrews, for whom the "flood" of 2349 BC, the flood of Noah, was the only flood in their recorded experience. However, the Noachian flood story incorporates elements of the earlier World Flood of 3147 BC, and perhaps also the earlier Black Sea flood, as does the story of the flood of Gilgamesh.

This last is hinted at in the *Epic of Gilgamesh*. Although nominally describing the flood of 3147 BC, the *Epic of Gilgamesh* clearly refers back to the spectacular flooding of the Black Sea basin in 5600 BC, with its descriptive references to the Black Sea (the "Sea of Death") and the Bosphorus Strait (which Gilgamesh's ferryman navigates by hanging a basket of rocks over the edge of his boat). Gilgamesh, in an impulsive gesture reminiscent of Hercules, cuts the ropes to the basket. On the north shore Gilgamesh visits with the Sumerian Noah, Utnapishtim. [\[note 32\]](#)

Flood stories are ubiquitous, and, interestingly, none of them recall local events where only thousands died. The flood stories all claim to be about a universal deluge, a worldwide catastrophic event which killed nearly everyone and also decimated the plants and animals. [\[note 33\]](#)

"But Deucalion in the ark, floating over the sea for nine days and as many nights, grounded on Parnassus, and there, when the rains ceased, he disembarked, and sacrificed to Zeus."

-- Apollodorus, 2nd century

"Tahiti was destroyed by a flood. A husband and a wife were saved. They had a chicken, dog, kitten, and a pig with them. They took refuge on Mount O Pitohito."

-- Tahiti, contemporary

"When the Moon did not yet exist, a bearded old man named Botschika taught the arts of agriculture, clothing, worship and politics to the people. His beautiful but malevolent wife was Huythaca. She caused a flood in which most people perished. Botschika then turned her into the Moon."

-- Columbia, contemporary [\[note 34\]](#)

At this point we have flood dates for circa 5600 BC, 3147 BC, and 2349 BC. But apparently the disturbance of 3147 was absolutely overwhelming. The *Epic of Gilgamesh* expresses the regrets even the Gods had for the utter destruction this flood caused.

*"How could I do this!
Am I so stupid,
That I give life
Only to take it away,
So that people fill the sea like fishes?"*

-- Inanna, in the *Epic of Gilgamesh*

Endnotes

Note 1 --

See the chapter "The Maya Calendar," for how reasonable the date of 3147 BC is if solar years are used rather than years of 365.24 days. In 747 BC, the Olmecs added 6 Baktuns of 400 Tuns to have a Long Count starting date of 6.0.0.0.0 on February 27th -- where a "Tun" was a solar year, at that time understood as representing 360 days. (See "The Maya Calendar," also for the concept of the Long Count, Baktuns, and Tuns.) If we understand that the Olmecs assumed that the year had always been 360 days, then we can extend this concept to say that the Olmecs counted in Tun years, where a Tun was a solar year -- without regard to the actual number of days in the year. Thus, subtracting 2400 solar years (6 Baktuns) from 747 BC, the date of the end of the "Era of the Gods" would be 3147 BC.

Hindu sources identify a number of calendars. A *Kali* era started on February 18, 3102 BC. In Kashmir, the *Laukika* era starts in 3076 BC. A third, the *Brhaspaticakra* era, starts in 3116 BC (15th *Encyclopaedia Britannica*). In China the date which comes closest to the beginning of the third millennium BC is the starting date of the first of the "Legendary Emperors" *Fu Shi* dated at 2953 BC.

[\[return to text\]](#)

Note 2 --

The *King List* was brought to Greece by Berossus, a priest of former Babylon, in circa 280 BC and published. Until the 19th century AD, when cuneiform copies were found during archaeological excavations in Mesopotamia, this was the only extant record.

The *Dynastic Chronicle* from Babylonia lists 9 kings before the flood. This per A.K. Grayson, *Assyrian and Babylonian Chronicles* (1975), where the opening text is the pre-flood list of the Sumerian *King List*. Berossus lists ten kings, one of which was the founder of the city of Babylon (which did not exist yet at that time).

[\[return to text\]](#)

Note 3 --

In fact, the documents from Sumer list the numbers in "sars" which is 3600, that is, 60 times 60, and in "ners" which represents 600, 10 times 60. The Sumerians used the decimal numbering system, but large numbers were expressed in sexagesimal. In the 7th century BC, the Assyrians still used "sarus" specifically to mean *3600 days*, that is, a decade of years of 360 days.

See the Appendix A, "Chronology," for the basis of a year of 225 days, and an analysis of the *King List*. I will use solar years (a rotation around the Sun) rather than our 365.24-day years. It would make little sense to do otherwise, since even "calibrated" Carbon-14 dates have been unwittingly adjusted to solar years.

[\[return to text\]](#)

Note 4 --

It is also from this time that the lengths of rulership become reasonable. The previous kingship at Kish and Uruk had included some 20 long-lived kings. Gilgamesh himself -- fiction or not -- is attributed a reign (or life span) of 126 years. It has frequently been suspected that some of the figures for the "kings after the flood" represent how long a king lived, rather than the length of his reign. With length of the year at 240 days at the time of Gilgamesh, he would have lived to the age of 82.

The very early poem *Gilgamesh and Aga* recounts the defiance of Gilgamesh as he stands up against Aga the King of Kish over a matter of digging wells. The poem has no literary

conclusion as we would like, although there is what looks like a later ending added which tells of Gilgamesh's capture and release of Aga.

A schema of notation is used for the long-lived "kings after the flood," which is different from the "turns" used for the "kings before the flood" and not at all clear. The literary style of the initial portion of the *King List*, the "kings before the flood," also differs from the remainder of the list in using archaic language. Near the end of the list, for the last of the records at the time of the fall of the Akkadian Empire, this style is used again.

Note 5 --

"Remarkable organizing ability was required to administer huge estates, in which, under the 3rd dynasty of Ur, for example, it was not unusual to prepare accounts for thousands of cattle or tens of thousands of bundles of reeds. Similar figures are attested at Ebla, three centuries earlier."

-- *Encyclopaedia Britannica*, 15th edition.

"There are samples of the clay counters used in the Near East from about 9,000 BC to 1500 BC. There were about 500 distinct types, although not in all times and places. Tokens start to be found at widely separated sites as of 8,000 BC (Carbon-14 dated), such as Level III of Tell Mureybet in Syria and Level E of Ganj Dareh in Western Iran. Tokens were used at sites throughout the Near East, from Israel to Syria, Turkey, Iraq, and Iran, with the exception of Central Anatolia. The farthest extent of their use was from Khartoum in the Sudan [West Africa] to the pre-Harappan [in Pakistan]."

-- John Alan Halloran, [\[www.sumerian.org\]](http://www.sumerian.org)

[\[return to text\]](#)

Note 6 --

If the arc from Saturn to Mars started up and extinguished eight times over the thousand years of the "Era of the Gods" and perhaps lasted over a hundred years each time then we should expect the upper hemisphere of Mars to have been severely burned. The top hemisphere is actually some three miles lower, but for no clear reason, unless it was originally an ocean. What is more interesting is the lack of craters in the north and the existence instead of five very large fulgamite lightning blisters (Olympus Mons, Arsia Mons, Pavonis Mons, Ascraeus Mons, and Elysium Mons) and three smaller ones (Hecatus Tholus, Albor Tholus, and Tharsis Tholus), clearly the mark of eight stupendous electric lightning strikes. Olympus Mons shows six separate strike marks (circular molten areas). The blisters are hundreds of times larger than any volcanoes on Earth. The caldera of Olympus Mons is 40 miles in diameter. These are not volcanoes.

The *Chilam Balam* book of the Maya calls this first Mars (actually calling it "first" as the Egyptians do) "Bolon Dzacab" which translates as "Nine-Lives" or "Nine Generations." The Olmecs thus perhaps counted occurrences of Mars when it was centered on Saturn, rather than counting the number of times it lowered to Earth. Mesoamerican languages count the existence of an event on completion, not at the start, as we do. The title "Nine-Lives" is typical of suggesting that the God appeared nine times. It is also very likely that the name "Bolon Dzacab" was given to Mars in the 8th and 7th century BC, when it damaged Earth nine times. See the chapter "The Chilam Balam" for details.

[\[return to text\]](#)

Note 7 --

There are early Ubaid (5600 to 4000 BC) walled towns in the same region. Walls were originally built as dikes and used to prevent flooding. The Ubaid culture represents the first settlers of lower Mesopotamia between the Tigris and Euphrates and precedes the Sumerian. But the model of a "city" comes from much older established cities of Anatolia (some listed below), which were frequently at war with each other, as shown by the collections of baked clay throwing balls at some locations.

The text of the *King List*, where each city is attacked or sacked in turn, reflects the political conditions in Sumer at a later time, when the cities of Sumer constantly attacked each other to remove kings and city gods.

The first *written record* of the construction of city walls in Sumer is the description of the walls of Uruk. The building of Uruk's city walls is attributed to Gilgamesh (circa 2700 BC), although archaeological indications are that he repaired the walls rather than built them. The first Sumerian kingship, however, was at the city of Kish, 300 years earlier. This dates the earliest composition of the oldest portion of the *King List*, including the "kings before the flood," to a 300-year period after 3147 BC at the city of Kish. The next portion, representing the addition of the kings of Kish and Uruk, probably dates to shortly after 2700 BC -- the time of Gilgamesh.

The *Vedas* list the number of times Mars approaches Earth as "a hundred," but the number is clearly meant as "a lot of times." The content of the *Vedas* reflects a history of the world since the "Era of the Gods" (or earlier). The *Vedas* were only rendered in script after 500 BC. A number of people have based complete cosmologies on the Vedic information, for example, Donald W. Patten and Samuel R. Windsor *The Mars-Earth Wars* (1996), and John Ackerman *Firmament: Recent Catastrophic History of the Earth* (1996).

[\[return to text\]](#)

Note 8 --

At this time, the Sun was probably visible, and if not, then at least it got light and dark in rotation, and days could be counted in this manner. As I have noted elsewhere, the rotation of

the egg, "without cease," in a circle around the North Pole would also have indicated the rotation of the Earth.

[\[return to text\]](#)

Note 9 --

The listed dates also show up in readings of texts of North American archaeology as dates marking long-term changes in climate, moisture, and vegetation, except for the appearance of the egg in 4939 BC. Thus the dates 5800 BC, 4219 BC, and 3147 BC, which are detailed in this narrative, may be compared with the approximate archaeological dates of 6000 or 5800 BC, 4300 BC, and 3100 or 3000 BC when changes in climatic conditions are noted.

For the year of 4219 BC I have two alternatives. From Josephus, the first century AD historian, a year of 4077 BC can be derived (already noted). From the Turin Canon, a Egyptian papyrus document, we can derive a year of approximately 4300 BC. I will use 4077 BC as the year that Saturn went nova.

[\[return to text\]](#)

Note 10 --

There are some impressive early sites in the Levant, Anatolia, and Pakistan: Eynan in Palestine, the earliest farming town (with houses), dated about 9000 BC; Jericho in Palestine, a farming and herding town, with its tower and enclosing wall, dated from 8000 BC (abandoned by 6800 BC); Catal Hoyuk, a village in Central Anatolia, dated from 7400 BC (abandoned 6200 BC); Hamoukar in Eastern Anatolia (near present Mosul), founded 5000 or 4500 BC and destroyed in 3500 BC; Mehrgarh, in the south of Pakistan (Balochistan), started as a village around 6000 BC, lasting to 2500 BC.

[\[return to text\]](#)

Note 11 --

The Neolithic farming communities had reached Central and Southern France by 5400 BC, but did not reach Northern and Western France until 5000 BC, the British Isles in 4300 to 4200 BC, and Scandinavia in 4100 BC.

A summary of Neolithic funeral practices follows:

- Exarnation (removal of the flesh) and decapitation are frequently used as the burial rite, as, for example, at Catal Hoyuk in Anatolia, 6000 BC, depicted even in murals. Scavenger birds are used to remove flesh. Burial of the bones is traditional, that is, below the floors of houses. Skulls are often kept separately in the living space.
- There are over two thousand barrows in France, Ireland, England, some from 5800 BC, but most from 3800 to 3400 BC, with passage graves starting in 3400 and lasting to 2400 BC. Burials are infrequent or the sites are reused. (Reuse of burial sites occurs

worldwide.) There is infrequent evidence of fire, perhaps as a cremation practice.

- The much later Kurgan people of Eastern Europe use pit graves (4500 BC to 2000 BC). A pit grave is called a "kurgan." These represent a peak-roofed house built underground, carry grave goods for accompaniment of the dead, and clearly differentiate distinct social classes.
- Many Western European stone henges are started in 3600 to 3400 BC, but most much later. Location seems important. All have easy sea and river access. Actual burials at henges are very infrequent. They may have been used only ceremonially.

[\[return to text\]](#)

Note 12 --

The fill of Gobekli Tepe in Turkey was carbon dated to 8,500 BC when first investigated, which is the date (8,347 BC) of the last appearance of the "turtle" as recorded in stelae by the Maya. Today the official construction dates vary, and tend toward a variety of ages -- 9600 BC to 7300 BC -- and as early as 10,000 BC.

The noted enigma of Gobekli Tepe is that archaeologists cannot imagine a hunter-gatherer society capable of such extraordinary construction efforts. The frequent depiction of wild animals on the pillars of the site is reminiscent of the Goddess Mari of the Basque, the Goddess of animals.

Perhaps archaeologists forget a few things. First, that Cro-Magnon humans had been around for 35,000 years in that territory. Second, they forget that hunting in this region left an enormous amount of free time. Anatolia at that time was a paradise. The constructions did not require an extensive agricultural base for the labor force. They also forget that limestone, when first exposed in a quarry, is quite soft and very easy to cut and carve. After all, limestone is created under seawater. It hardens after exposure to the atmosphere.

Last, archaeologists, growing up in a society where God has become a philosophical concept, underestimate the important concept of life after death in remote antiquity.

Others have suggested that the Gobekli Tepe "temples" might have been mortuaries (but few bones have been found). When in 8347 BC the ball plasmoids disappeared, the site was officially (and with a coordinated group effort) abandoned by backfilling the space with garbage and loose dirt. (Although some of this has been dated to a much earlier time.) We don't know what happened to the bones, if there were any. At Malta, all the bones of the various "temples" were dug up, and stored in a large underground space under one of the temples -- disarticulated and mixed with black dirt, to be found 10,000 years later.

Following from the original proposal of three ball plasmoids seen in the far south, as described by Peratt, the display would have disappeared a number of times, thus requiring reconstructions of the temples.

A hilltop location would be fully appropriate to the southern celestial display which would only be seen from an elevation. At present it is becoming suggested that there may have been three levels of the Gobekli Tepe "temples" excavated so far. But there are some 16 additional circular structures. The T-shaped posts have been used at other locations in Anatolia at approximately the same dates.

[\[return to text\]](#)

Note 13 --

Single chamber barrows disappear after about 3500 BC. This may be an indication of the time at which multi-lobed plasma discontinuities become prevalent in the stream of plasma from Saturn.

[\[return to text\]](#)

Note 14 --

See Maximillian Ottmar Baldia "A Spatial Analysis of Megalithic Tombs" (Doctoral Dissertation, Southern Methodist University, 1995), which reports on the average orientation of all 2385 tombs in Western Europe. Most chamber alignments are on compass directions of roughly west-northwest and east-southeast, with entrances on the southeast side. These are median figures, that is, there are also some north-south and east-west orientations.

[\[return to text\]](#)

Note 15 --

The smaller orbs following Mars were identified as seven in number by Talbott -- overheard as an off-hand comment by others at a Saturnian conference. Anthony Peratt notes that the number of nodules developed in Birkeland currents is almost always seven or nine in number. On reaching Saturn they are seen as surrounding Mars (but at that point these are the seven satellites of Saturn). This is reminiscent of Snow White and the Seven Dwarfs, or any number of similar narratives, involving the theme of death, a red orb, and a far-away residence. Snow White is Mercury.

[\[return to text\]](#)

Note 16 --

You wonder why the population did not simply move away from the coasts of the North Atlantic. On the other hand, maybe they did. From artifacts and occasional pottery, it looks like the people building the barrows were not indigenous to this region.

[\[return to text\]](#)

Note 17 --

Some barrows in Europe date well into the Middle Ages, but many of these are fake and were

constructed to claim land ownership. Barrows were still under construction in India in the 19th century AD.

[\[return to text\]](#)

Note 18 --

The oldest aboveground temple at Malta is Gigantija, on the island of Gozo, dated to 3600 BC, and has its major axis aligned northwest and southeast, with the entrance in the southeast. The temple is the prototype for all the later Malta temples -- 30 to 40 of them -- and used the largest megaliths.

[\[return to text\]](#)

Note 19 --

We may be overestimating the size of the workforce needed to move stones, but a great deal of labor was required to build the ditches around the henges. Thus, specifically for Stonehenge, the suggestion that this structure was built by a non-indigenous force, the "Beaker People," then accounts for the fact that the shallow ditch was never maintained, and additionally that the bank was placed on the wrong side of the ditch.

The stones are much easier to move if balanced at the center on short pieces of wood, cut across the grain. Wood has high compressive strength in the direction of the grain. The use of rollers, often suggested, is just an insane idea and will not do. The logs would be bruised and crushed, and rollers allow almost no control over the direction the stones will move unless the ground is dead flat and the logs are very even. Angled-up sleds are much more likely to get any serious dragging done.

There have been many efforts to duplicate the dragging of large boulders in France, Holland, Germany, and England. They all demonstrate that a very large workforce is required, and that the boulders never move as expected when placed on rollers. Descriptions of some of these efforts may be found in Jean-Pierre Mohen, *The World of Megaliths* (1990). Included as an anecdote, is the following statement:

"The old Breton quarrymen knew how to manoeuvre moderately sized blocks [of stone] by using wedges, rollers, levers, and ropes to move them sideways on their points of balance and imbalance close to the center of gravity. Thus even small groups of men could roll and shift blocks sideways by working first one side and then the other."

The stones can be walked and raised by two people in a few hours by rocking and inserting wood left and right near the center. Rocking involves people walking from one end to the other on the top of the stone. We tend to think in terms of dragging giant boulders, which has to be the most inefficient way of working; we don't think in terms of vast quantities of available lumber. Large stones can also be moved relatively easily by using a track of wooden rails as supports and shuffling the stones along with pinch bars. This apparently was

the method used in Malta.

There is, in fact, a suggestion by Herodotus that the blocks of the pyramids at Giza were moved with some unidentified devices, requiring thousands of components. The best interpretation has been to suggest that these devices were short stubs of wood. A walked megalith can be moved with minimal effort, requiring only a few workers, since the momentum of the block of stone will aid in movement. See for example the website of W.T. Wallington, at [\[www.theforgottentechnology.com\]](http://www.theforgottentechnology.com). Wallington writes:

"I have found that ancient legends from around the world are true. Some megaliths could have been set in place by as few as one man. I could build The Great Pyramid of Giza, using my techniques and primitive tools. On a twenty-five year construction schedule, (working forty hours per week at fifty weeks per year, using the input of myself to calculate) I would need a crew of 520 people to move blocks from the main quarry to the site and another 100 to move the blocks on site. For hoisting I need a crew of 120 (40 working and 80 rotating). My crew can raise 7000 pounds [at] 100 feet per minute. I have found the design of the pyramid is functional in its own construction. No external ramp is needed."

What is amazing about Wallington's "methods" is that these duplicate my own experience in moving huge machinery, yet every "expert" in the world will attempt to drag the blocks. This is even true of recent attempts, where people have forgotten how this could have been done. I have "walked" refrigerators up flights of stairs, and moved 40-ton machines with a pinch bar (pry bar) and a can of oil.

Note 20 --

Some of the earliest henges are the Central European wood henges, called "roundels," supposedly dating from 5000 BC. Roundels are closely spaced two-foot diameter tree trunks set up in a large circle with four open entrances. No signs of interior structures or burials are associated with these. The only activity seems to have been feasting. That is generally true for stone henges also.

Peratt in his 2003 article in *IEEE Transactions on Plasma Science* separates the plasma stream display from the source (the anode) -- which (for us) would be the planet Saturn. He notes that the stream most often tends to divide itself into 56 or 28 discrete streams at the anode, and compares this to the henges and the circular designs pecked into vertical rock walls, worldwide. He notes that he has found "hundreds" of these coincidences, on separate continents: the Americas, Europe, Australia. All use 56 posts or megaliths (or pecked depressions) in the outermost circle. The coincidence of design includes a secondary interior ring of plasma streams, and a flow from the outer to the interior rings (representing a

substantial increase in current of the plasma stream). When these designs are presented high up on cliffs with a clear view of the south, they obviously represent the plasma stream from the south, the "Peratt Column." But this would be true for an object blazing in arc mode plasma discharge above the north polar regions also.

Peratt claims Stonehenge is an exact model of *"a plasma discharge, a lightning stroke that must have been unprecedented in intensity and duration."* He certainly is not talking about an aurora. Presented in a paper at the University of Pennsylvania Museum of Archaeology and Anthropology "Celestial Catastrophes in Human Prehistory?" on 17 October, 2001. Peratt has avoided stating the obvious -- that the "lightning stroke of unprecedented intensity and duration" is a planet in arc mode plasma discharge with Earth.

The henges refer to an object in the northwest on a sight-line from near England and Ireland where these henges were constructed. The dates of the henges do not coincide with the estimated dates of the three ball plasmoids seen in the south. The people in the northern hemisphere no longer needed to climb up mountain sides to get a good look at the object in the sky. It was adjacent and almost directly above them.

Note 21 --

A Roman author of the first century BC, Diodorus, makes note of "a temple to Apollo" in use with the "Hyperboreans" (presumably England), where "the God appears every 19 years." This is obviously in reference to Stonehenge, which was reconstructed in 2100 BC, with an entrance aligned by coincidence to match a midsummer sunrise, in fact, the current midsummer sunrise.

The axis of Stonehenge into the causeway leading away, when estimated on the basis of some fallen stones in the causeway with romantic names like "Slaughter Stone," is at an azimuth of 49.95 degrees, measured by Alexander Thom in 1976. The axis was measured from one of the original postholes, which had been backfilled with chalk. Postholes have not relocated, but none of the standing stones are in their original locations, so this measure of 49.95 degrees might have meaning, or not.

It would be off from today's sunrise location at the solstice (50 degrees azimuth) by less than half the width of a finger held at arm's length, but of course by much more if compared to the uniformitarian retrocalculated midsummer sunrise in 2100 BC (when the causeway was apparently added) of 53.3 degrees azimuth -- it would be off by 3 and a half fingers, a fist. Wikipedia claims "the summer solstice sun rose close to the Heel Stone, and the sun's first rays shone into the centre of the monument between the horseshoe arrangement." That seems OK for today, but does not fit the original constructions undertaken in 3100 BC, 2400 BC, or 2100 BC. The idea of celebrating the solstice seems to be a peculiarly British concept.

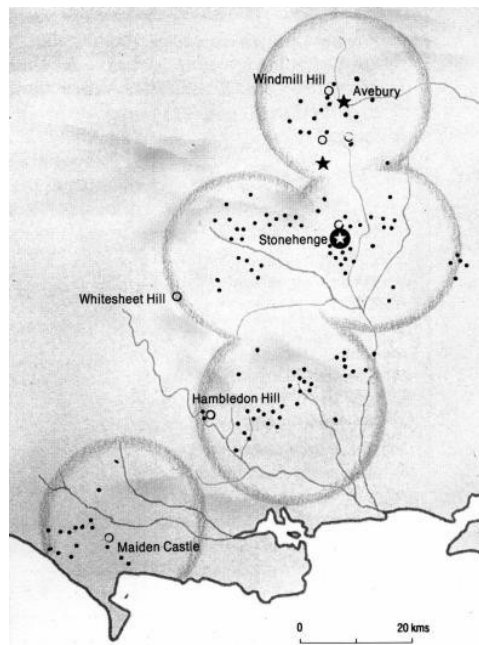

Diodorus may have presumed that the 19-year cycle marked lunar eclipses, which already

before Diodorus's time were known to occur on a 19-year "Metonic cycle." The number 56, the number of postholes at Stonehenge, is three Metonic cycles of 19, 19, and 18 year intervals. The circle of blue stones at Stonehenge also numbers 19. An interesting coincidence.

The *Iliad* takes place over 56 time periods, 55 days and one night. The night event is the logical center of the book, and all the other events rigorously match each other about this center. The main actors take on animal characteristics for the night raids at the center of the book, and the next morning things start to go better for the Greeks. See Guy Davenport, *Geography of the Imagination* (1981).

Note 23 --

See for example Pierre Mereaux, in *Carnac: Des Pierres Pour Les Vivants* (1992), who rejects the suggestion of an astronomical alignment proposed earlier by Alexander Thom for the Carnac causeways. As paraphrased in a review by Roslyn Strong in the *NEARA Journal* (2001), "there seemed to be no reason to erect thousands of stones to verify certain risings and settings of the sun or moon." Nor does Mereaux accept the "cult of the dead" proposed

by Roger Joussaume in *Dolmens pour les Morts* (1985?).

Mereaux investigated the electric properties of the granite menhirs at Carnac, as well as the properties of the geological subsurface of the region. One conclusion is that the standing stones would readily attract lightning (and of course Saint Elmo's Fire). There were no stones erected where the subsurface was not composed of quartz-bearing rock. Where the menhirs stand, the soil is very shallow, and thus the menhirs are in contact with the subsurface rock. I do not accept Mereaux's thesis that the alignments represent a megalithic seismic detector. Who ever needed that?

[Image: Ouachita mounds, circa 3400 BC. Artist's rendition. Ouachita river bank, Louisiana. Watson Brake diagram by Martin Pate.]

In North America an oval of mounds (11 of them) at Ouachita in Louisiana, dated to 3400 BC, stands out. This also was not a burial or occupation site.

In Mesoamerica (Mexico) there is no record of monuments before about 1500 BC, although there are in Guatemala. In South America there are many constructions dating to the "Era of the Gods" or shortly after.

The next serious mound building phase in North America is the Adena culture, located throughout the Ohio valley, and dating from circa 700 BC. This is followed by the much

[\[return to text\]](#)

[Image: Avebury, sketch by William Stukeley, AD 1720.]

A wood-post building located within the smaller henge, known as "The Sanctuary," located at the far southeast end of the causeway to Avebury henge, is completely equivalent to the valley buildings of the Egyptian pyramids. Within a circle of standing stones was a wood structure which was replaced up to five times with a building of the same dimensions. Described in *British Archeology* (Feb 2000).

A second causeway leads out of Avebury toward the southwest (more or less, the end is not well defined) ending near two large long-barrows, which were apparently closed up by the builders of Avebury. Together these may have represented the earlier Peratt column and two of the southern ball plasmoids. The southwest causeway is today only half the length of the southeast causeway. We would actually expect the southwest causeway to be much longer. William Stukeley visited the site in the 1720s and recorded (or at least suggested) a much longer southwest causeway. Almost all the stones were destroyed and removed by Christians.

There is a third and fourth long-barrow directly south of the Avebury henge (West Kennet and East Kennet), and further south than the two mentioned above. Also directly south of Avebury is Silbury hill, a huge man-made hill of chalk.

The remnants of a secondary circle of stones has been found at the east terminal of the causeway leading out from Stonehenge at the river Avon, today called Bluehenge. The impressions of 27 (not 28!) of the blue stones, later moved to Stonehenge, have been unearthed.

[\[return to text\]](#)

Note 26 --

Considering how slowly an electric charge "leaks away" to space, it might not be correct to say that the atmospheric electric charge dropped considerably after 3147 BC. It is more likely that the Earth experienced a large drop only in 2349 BC, when Venus made electric contact. More on that in the following two chapters.

The blue stones of Stonehenge were re-installed at a structure at the end of the causeway (called Bluehenge) leading out from Stonehenge toward the northeast, which bends to continue east and then southeast, meeting the river Avon. This has only recently been detected through stone chips left behind. The blue stones were later returned to Stonehenge.

[\[return to text\]](#)

Note 27 --

The first temple at Jerusalem, built in about 950 BC, was oriented 6 degrees west of north, which is equivalent to 6 degrees north of east in the chart below. For Jerusalem the second temple (525 BC) was correctly oriented east-west.

Temple orientations, although admittedly late in antiquity compared to the date of 3147 BC, were tabulated by Rafael Kazmann, in "On the Orientation of Ancient Temples and Other Anomalies," in *Aeon* (1990), from published data. Kazmann was convinced that these temples were meant to have the first sunlight on the equinox fall into the center of the temple (as was reputed to be the case for the first temple at Jerusalem, by Solomon). From this Kazmann proposes various shifts of the east cardinal direction and thus the North Pole. But the first light of the Sun on the equinox will always be from directly east, anywhere on Earth.

Following is the published list sorted by angles north or south of east as follows:

location	temple	deg:min	direction	date
Olympia	Jupiter	7:22	N of E	790 BC
Jerusalem	Jehovah	6:0	N of E	925
Girgentl	Juno Lacinia	6:0	N of E	690
Megalopolis	Castor	4:0	N of E	400
Olympia	Juno	3:16	N of E	1445
Megalopolis	Hercules	0:0	N	470
Tegea	Minerva	1:23	S of E	1650
Rhamnus	Nemesis	1:24	S of E	787
Rhamnus	Themis	1:29	S of E	1092
Lycosura	Despoina	2:11	S of E	650
Corfu	Kadarki	4:39	S of E	875
Selinus	Unknown	4:52	S of E	795?
Ephesus	Diana	5:21	S of E	715
Athens	Nike Aptersos	5:43	S of E	1130
Thebes	Cabeiron	6:27	S of E	1160
Athens	Minerva	9:05	S of E	2020

The orientations listed above might represent the minor axis of temples. North of east is then the same as west of north. The small deviation of one or two degrees listed for south of east can be taken as wholly equivalent to a true north-south axial direction. The measures of four to nine degrees south of east obviously point to South America.

The Ka'aba at Mecca is also oriented to the northwest.

Note 30 --

Marinus van der Sluijs notes the following with respect to the localization of mythology:

"The fact that people made so much effort to locate the gods of a mythical past in their own lands points to the suggestion that the gods were no longer present at the moment the transfer was made. And this is a conclusion rarely made, if not never before, but nevertheless quite much in line with the whole idea of localization 'überhaupt.' In identifying the nearest mountain as the cosmic mountain of the gods, the nearest river as the river of the gods, and any tree similar to the cosmic tree as the tree of life, the

ancients literally 'brought the gods down to earth' and would have succeeded, to their own satisfaction, in recovering the age of the gods."

-- [\[www.mythopedia.info\]](http://www.mythopedia.info)
[\[return to text\]](#)

Note 31 --

Egyptian temple plans are a reflection (a mirror image) of the signs in the sky, rather than a "projection." A plan based on a projected image is used in the construction of henges in Europe. This disconnects Egyptian culture from Western European Neolithic culture, except for the causeway design of European henges and Egyptian mastabas and pyramids, which are in all cases on the southeast side.

[\[return to text\]](#)

Note 32 --

The reputation as the "Sea of Death" apparently dates from remote antiquity. The mass of decaying plant material at the bottom of the Black Sea still releases bursts of methane gas today, which dissolves into the water on rising. This reduces the density of the seawater at the surface -- enough to suddenly sink ships.

The surface current of the Bosphorus flows toward the Mediterranean. A much lower current carries salt water into the Black Sea. A weighted basket hung off the boat into the lower current will drag the boat toward the Black Sea. This also seems to have been known since remote antiquity.

Note 33 --

Gunnar Heinsohn writes:

"The first truly comprehensive compilation of flood sagas was written a hundred years ago. From Babylonia to Haiti, it listed eighty-eight texts. Forty appeared to be genuine pieces created independent of each other. Only twenty myths of this collection seemed to have traveled, that is, were borrowed via diffusion. The rest were duplicates only exhibiting minor variations from other stories found in the same era. A decade later, seventy three genuine stories could be reported. Soon, the number of flood stories swelled to two hundred and sixty eight. Ten years later, five hundred deluge myths coming from two hundred and fifty nine peoples or tribes were estimated. Special studies were devoted to parts of the world of which the flood myth was claimed to be absent by the pioneering researchers: Northern Asia, eventually, yielded twenty one texts. In Africa, two dozen myths could be located."

-- Gunnar Heinsohn, at the Conference *CATASTROPHISM 2000*, University of Toronto, Ontario, 1990.

Egyptian references to a massive flood are found in the Pyramid Texts as threats made by the dead pharaoh after he reaches the northern stars. Actually, as Leonard King wrote in circa 1917:

"The nearest Egyptian parallel to the Deluge story is the "Legend of the Destruction of Mankind", which is engraved on the walls of a chamber in the tomb of Seti I. The late Sir Gaston Maspero indeed called it "a dry deluge myth."

"The narrative ... betrays undoubted parallelism to the Babylonian and Hebrew stories, so far as concerns the attempted annihilation of mankind by the offended god, but there the resemblance ends. For water has no part in man's destruction, and the essential element of a Deluge story is thus absent."

-- Leonard King *Legends of Babylon and Egypt* (1918)

The Egyptians recorded a flood-like event, but it involved the slaughter of men by the Goddess Hathor. She is calmed down by the Gods with the application of 7000 jars of red dyed beer, simulating human blood. The stories are found in New Kingdom tombs, after 1500 BC, and reflect the event of 2349 BC, not of 3147 BC.

[\[return to text\]](#)

Note 34 --

The rains mentioned by Apollodorus equate his flood recollection to 2349 BC, not 3147 BC.

The Columbian "bearded man" is Saturn with a plasma instability of a series of toroids, looking like a puffy beard. This is the same fake beard also worn by the pharaohs of Egypt, and found on images in Mesopotamia (although the beard is added to a God who is obviously Jupiter). This Columbian snippet, which ties the Moon to a flood, also describes the flood-like event of 2349 BC. The Moon showed up near Earth at that time.

Contents of this chapter: [\[The Flood\]](#) [\[The Battle of the Gods\]](#) [\[The Absu and Duat\]](#)
[\[Endnotes\]](#)

The Flood of 3147 BC

The World Flood, identified as the flood of Gilgamesh, was an extraordinary flood, consisting of a series of worldwide tsunamis. The apparent cause was the removal of Saturn from above the North Pole. The sea waters which had run off the pulled-up crust at the North Pole had collected at the South Pole where the crust was drawn into the interior of the Earth, were suddenly released. [\[note 1\]](#)

Those waters must have stood miles high in the south polar sea, and to a lesser height, but in much greater volume, in the South Atlantic, the South Pacific, and the Indian Ocean. At the same time, the sea level at mid-latitudes might have dropped hundreds of feet. No other flood in later times would approach the devastation of the World Flood of 3147 BC, and the retellings of all later floods would always refer back to the event of 3147 BC.

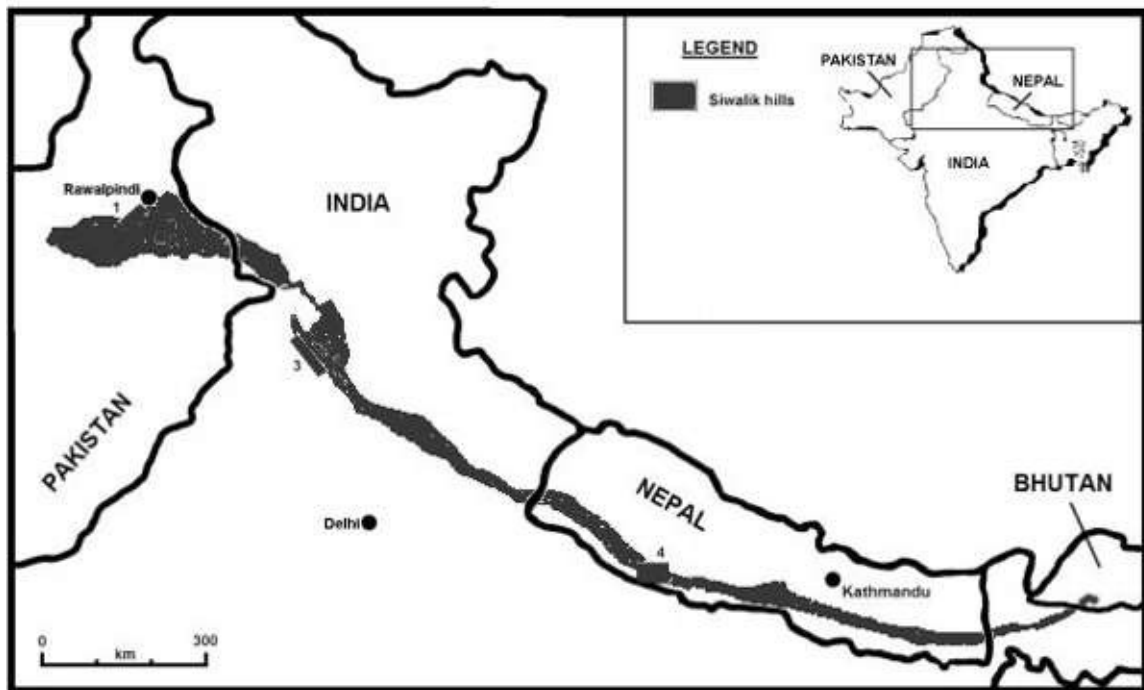

Many of the flood stories deal with rain. Certainly the Black Sea flood of 5600 BC, which burst forth at a rate of over 14 million gallons per second, would have stirred up a lot of mist and, on hitting the warmer atmosphere of the Black Sea region, would have resulted in continuous rains. To the victims it looked like rain caused the rising waters. But it is much more likely that the rains are associated with the later catastrophe of 2349 BC. The early Sumerian flood myth does not include rain.

A consideration of deposited layers of materials worldwide would make it look like the flood of 3147 BC might have had the following sequence:

- The flood event consisted not just of waves of water traveling the length of the globe, but also included the action of a releveled of seas worldwide.
- The first release of water from the south polar regions, the South Pacific, the South Atlantic, and the Indian Ocean would have sent waves north with only a few locations that had a clear path as far as the Arctic Ocean. In many locations the water was forced

to sweep across the continents.

- India and Australia were inundated by the northbound waves from Antarctica and the Indian Ocean. The contents of the South Asian continental shelf and the lowlands were piled on the south slopes of a mountain range which was later overridden by the Himalayas. A secondary rebound of this wave probably struck across Australia from the northwest.
- India was wiped clean of people and animals. These were piled up at the southern foothills of the Himalayas (the Siwalik Hills). As is clear from the deposition of layers of mud and silt interspersed with the accumulation of trees and the bones of jungle animals, there would have been a dozen separate gigantic waves of water from the south. [\[note 2\]](#)

[Image: Siwalik hills along the northern border of Pakistan, India, Nepal, and Bhutan. After Parth Chauhan.]

- From the south Pacific the tides would have swept over Southeast Asia and China. In Siberia (as in North America) the first waves of water from the south rolled across land ripping out trees and sweeping herds of grazing animals ahead of the water. There was a pile-up of bones and broken trees when the Arctic Ocean was reached. The Arctic Ocean today holds much more muck than any of the other seas.
- The salinity of some lakes can be traced to the flood of 3147 BC, including Lake Bonneville and the Caspian sea. Seals in Lake Baikal in Siberia and squid in Lake Onondaga in New York State also have no other explanation. There are numerous other instances of displaced marine species. Remains of whales have been found in the Andes, in the Sahara, and in the state of Michigan.
- The equatorial bulge, which amounts to about 10 miles, was no obstacle for the initial wave from the south, which probably stood miles high, as it headed toward the north

pole.

- The Pampas of Argentina were scoured clean and the soil consolidated and deposited in valleys. Eastern Brazil and the West African bulge were similarly attacked by water from the south. We see this also where the low-lying Southeastern United States juts out into the Atlantic. The Western United States, which narrows the Pacific Ocean, was breached by the first waves from the south. The water rushed over the coastal mountains to drop into the valleys beyond.
- At the Bering Straits the rebounding Pacific waters had no oceanic escape, and swept over Alaska and Western Canada, as well as Northern China (Siberia). In these locations we often find many feet of silt and loess, with only a thin layer of black soil (humus) at the top. The fossil content of Alaskan river valleys has always astounded archaeologists with its content of broken bones and splintered wood -- many from temperate and tropical areas. [\[note 3\]](#)
- Where the waves had lowered because of a wide ocean, as in Southeastern United States, we find an admixture of marine organisms with scoured remains of plants, trees, animals, and soil. Elephant remains have been found in the Southeastern United States, mixed with unfossilized (closed) seashells. Lower secondary waves often deposited marine species above the layers of land animals and plants.

Where was it safe for humans? Although the initial tsunamis overran coastal mountains and even land glaciers, inland away from the coasts and on higher ground would have provided safe places -- the east side of the Andes, and the central regions of Asia, Europe, and Africa. Coastal areas which run in a north-south direction were also safe, for the waves would not be forced inland. But any coastal areas which stood in the path of the waves would be overrun by water. In some regions, we can surmise, a wall of water ran for hundreds of miles across relatively flat land, building giant dunes, as in areas of Australia and the Western United States.

The Mediterranean regions, surrounding an inland sea, were little affected, as also the upper reaches of Mesopotamia and Anatolia. The waters headed north from the Indian Ocean for the Red Sea and the Persian Gulf would have battered Somalia and Oman respectively. But the Red Sea and the Persian Gulf are additionally protected by their pinched southern necks. The Sumerians certainly had flood myths, but the Egyptians did not.

Recent tsunamis due to submarine earthquakes have been one hundred feet high on reaching a coastline. (And travel in excess of 400 miles per hour.) The damage (in that case) is mostly limited to coastal areas and the waters flow back to the oceans immediately. They certainly would not "cover the Earth." But simultaneous gigantic worldwide tsunamis miles high would be an extraordinary disaster. [\[note 4\]](#)

In a number of deluge tales the Gods felt remorse for the flood they had brought and set a sign in the sky as a promise not to do so again. In the *Epic of Gilgamesh* the Goddess Inanna (Venus) raises her necklace of lapis lazuli so as to never forget the flood. Noah receives the sign of the rainbow. I have never thought that God would set a rainbow as a sign in the sky.

With the later flood of 2349 BC (the flood assigned to Noah), the sign in the sky was the Moon, but as likely it was the appearance of the south (and north) polar plasma plumes, which I will discuss below. In the Babylonian *Enuma Elish* (of about 1700 BC), Marduk (Jupiter) plants his war bow in the sky to commemorate the flood (the Noachian flood). This vertical "bow" is today confused with the horizontal "rainbow." [\[note 5\]](#)

It was Jupiter's approach which caused the flood -- by displacing Saturn away from the location of Earth. On the first instance after the flood, and as the flood was subsiding, the Earth was located at a considerable distance below Saturn as well as below the nearing Jupiter. The "mountain" of the flood stories, where Noah moored his ark after the waters subsided, is the lower plume of plasma of Jupiter, directed out from the region of Jupiter's south pole (which is the north magnetic pole). The mountain was colored green (as we know from Egyptian depictions of Osiris, as well as the *Popol Vuh* of the Quiche Maya). On top of the mountain of plasma was Jupiter enclosed in a coma, but lighted by the Sun. With the Earth located below the orbit of Jupiter, only the bottom crescent of this was seen. This was the mountain and the ship of Noah, recorded in hundreds of flood myths.

After his ship landed on this mountain, Noah released a raven to test the waters but the raven just flew back and forth and did not return. Noah next released a dove. The dove returned the first two times, but not the third. The details occur in the Bible, attributed to the flood of 2349 BC. Nearly the same events were recorded in the Sumerian flood epic, written a few hundred years earlier. The raven is the release of the darker Uranus into a larger orbit. Uranus was known as a bird from thousands of years earlier (and as a duck), and the peculiar tilt of its axis of rotation may have shaped its coma into a winged creature.

At this time the Earth was on an inner orbit, while Saturn, and Jupiter afterward, completely outside the orbit of Earth, were both receding from the Sun. Over the next few revolutions of the Earth around the Sun, Uranus would have been seen alternately on the east and the west of Jupiter, looking like a raven flying back and forth aimlessly, first approaching Jupiter (which still looked like a mountain) toward the east, and then moving away, but on the other side of Jupiter.

The light-colored Venus, the dove, was initially seen moving from behind Jupiter on an outer orbit, carrying a green olive branch to Noah (on the mountain of Jupiter). This is the plumage of Quetzalcoatl. The green olive branch, or quetzal plumage, is a plasma tail of ionized Hydrogen. Venus soon disappeared from view as it rounded the Sun.

In the Sumerian *Epic of Gilgamesh*, on the seventh day after the flood, Utnapishtim sent out successively a dove, a swallow, and a raven; only the raven (Uranus) found a resting place and did not come back, that is, the raven soon (within two years) disappeared into deep space. He was not seen again. The dove (Venus) and the swallow (Mercury?) do return, for they start to orbit the Sun. However, my suspicion is that Mercury traveled with Saturn until Saturn reached the asteroid belt (about 80 years later). In that case it may be the Moon which exhibited the split tail of a swallow (since it has no magnetic field) and a sweeping bow

shock. The Moon had an atmosphere until 2205 BC. The Moon orbited the Sun at some distance from Earth's orbit.

The Bible and the *Epic of Gilgamesh* record that Noah and Utnapishtim, respectively, offered a sacrifice to God (or the Gods) after leaving the ark. This fire, located on the mountain, is probably the sight of the Sun-lit side of Jupiter, but now seen from a much greater distance and at a higher elevation than before. Jupiter continued to recede away from the Sun, seen in red, with the smoke from the fire seen as the much lesser wisps of plasma extending from the upper region of Jupiter -- the upper plasma chalice form.

The Gods, reads the *Epic of Gilgamesh*, crowded like flies around the smoke of the fire. These are the satellites of Jupiter buzzing around the planet. I do not know the disposition of Saturn, for nothing more is ever heard of this planet, although all peoples everywhere continued to be able to locate Saturn in the sky as a pinpoint of light.

In Egypt, almost unaffected by the flood (the Delta region flooded), and in Mesopotamia, the sight of the approaching Jupiter, seen initially in the north with horn-like plumes surrounding its coma and a massive mountain of plasma below, was understood as the "Bull of Heaven" who wrecked the city of the Gods. He is shown as bulldozing city walls (and people) on Egyptian cosmetic palettes between 3100 BC and 3050 BC.

Jupiter had been known since the clouds of chaos lifted thousands of years earlier. Because Earth was located far below Saturn, and thus below the ecliptic, Jupiter had been represented as a pair of up-pointing horns, a crescent, when traveling inside the orbit of Earth on the sun-side (and as an oval "egg" shape when located outside the orbit of Earth).

The event of 3147 BC appears to have been an all-encompassing disturbance. The stories only attest to the flood, but there is also a sudden change in the climate and the start of a cooler and dryer period. The mild and wet days of the "Era of the Gods" never return and further glaciation stopped suddenly. There certainly is evidence that the length of the year changed. Civilization -- cultivation of grains, trade among regions, and even the development of writing -- came to a sudden halt, and regressed. In Mesopotamia the sudden halt of civilization is known as the Jemdet Nasr period.

What caused the catastrophe of 3147 BC?

The Battle of the Gods

The catastrophe of 3147 BC involved more than the disappearance of Saturn from the north sky. It involved the near "collision" of the group of 7 planets with Jupiter. What most likely happened in 3147 BC is that Saturn, together with Earth, Mars, Mercury, Venus, Neptune, and Uranus, "ran into" Jupiter, which was then located probably at 0.7 AU from the Sun. (See Appendix B, "The Celestial Mechanics," where this information is derived.)

Possibly some 3 million years earlier, Saturn had assumed a closer orbit around the Sun as a result of a remote electric shock between Saturn and Jupiter -- which would have been attractive, thus bringing Saturn closer to the center of the Solar System. The resulting new orbit of Saturn was an ellipse, with aphelion (the furthest distance from the Sun) beyond the orbit of Jupiter. Saturn would annually return to cross Jupiter's orbit. In 3147 BC Saturn reached this location just as Jupiter also arrived.

What I have characterized as a "collision" above, should be understood as an intersection of the plasmasphere of these planets. It could readily be suggested that when the plasmaspheres of Jupiter and the Saturnian planets connected (at an estimated distance of perhaps 8 million miles), it instantly reformed to a different shape to include both giant planets, but in the process locked out the small planets Earth and Venus. Located far below the south pole of Saturn, Earth was not likely to have been within 3 million miles of Saturn when Jupiter closed in, and escaped easily. In Appendix B, "The Celestial Mechanics," the estimate that Earth at that time was located about 3 million miles below Saturn is derived.

We can also again perform an analysis in terms of the gravitational sphere of influence. Tom Van Flandern notes that a sphere of influence would be drastically reduced in size (for smaller objects) with a change in the mass to the primary (which doesn't happen), or the proximity of another large body (like the Sun). Under that condition a planet could lose its remote satellites in closing in on the Sun. This also doesn't normally happen, but had happened repeatedly for Saturn over the last 600 million years.

The gravitational sphere of influence of Jupiter, measured as 100 times the planet's diameter, would be about 8,700,000 miles. In the proximity of three other large planets (Saturn, Neptune, Uranus), the gravitational sphere of influence might have been reduced to under 3,000,000 miles. The same would have happened to Saturn and its companion planets (Saturn would have had an initial sphere of influence of 7,000,000 miles.) The change in the diameter of the gravitational spheres of influence of the large planets would seem to be the cause for the release of Earth and Venus from the Saturnian stack, and the avoidance of capture by Jupiter.

Earth would have changed its orbit as soon as it was released from the grip of Saturn, placing the Sun gravitationally at one of the two nodes of its orbit. This accounts for the change in perspective on Jupiter (and briefly on Saturn, as recorded in Mesopotamia and Mesoamerica). It also accounts for the fact that the plane of Earth's orbit today still has the largest divergence from the Sun's equatorial, because Earth was furthest below the orbits of the other planets.

Earth and Venus seemed to have escaped from the encounter easily. They were each cast off by the near collision into separate elliptical orbits of different elevation, with the greatest vertical separation between their orbits at aphelion. Both Earth and Venus would continue to return to the orbital location of the "collision" in the future.

It is uncertain how Venus managed to escape, but it is likely that Venus at the time of the collision was orbiting around the mass centroid of Uranus, Neptune, and Saturn, and was thus located far above Saturn, and most likely at the level of Neptune. It is possible that Venus orbited outside of the close fitting plasma sphere of Saturn. If, at the time of the collision, Venus was located on the side away from the downstream plasmasphere tail of Jupiter, it may have been locked out of the reformed plasmasphere of the two main planets.

Mars and Mercury remained in the contracted coma or plasmasphere of Saturn, since they were close to Saturn (probably within two million miles) and likely at a matching potential. Mars probably was part of the Saturnian system since about 30,000 years ago, Mercury had been there since 17,000 BC. Both remained with Saturn and were apparently only released 80 years later, when Saturn entered the asteroid belt and its coma shrank considerably (and Saturn's sphere of gravitational influence).

If we can trust the *King List* for the "kings before the flood," it looks like Mars had completed a descent to Earth some 80 solar years earlier, and was in the process of returning to Saturn. (The last descent is the only one in the *King List* which is not a whole interval of 32 years. See Appendix A, "Notes on Chronology.")

Titan, larger than our Moon or Mercury, remained in orbit around Saturn, as did the other satellites of Saturn and Jupiter, and probably the satellites of Uranus and Neptune. The counts of satellites of Saturn and Jupiter noted in antiquity (as, for example, from Egyptian, Mesopotamian, and Mesoamerican sources) match the counts of satellites today -- barring tiny rocks and extremely distant satellites discovered only in the 20th century. In the last century it has become known that many primitive people knew the number of satellites of both Jupiter and Saturn. They are also depicted on Mesopotamian seals. Egyptian funeral practices identify seven large (visible) satellites of Saturn as the "Helpers of the King" or the "Sons of Osiris" known since before 3147 BC. Today Saturn still has seven large satellites which can be readily seen with binoculars. [\[note 6\]](#)

Neptune and Uranus, the two large planets above Saturn, were cast into much larger orbits. Uranus is reflected on briefly in the Sumerian flood epic and then never taken note of again. Uranus is one of the Titans "banished" by Zeus (Jupiter) in Greek mythology. "Banned" because they preceded Jupiter into the far reaches of space.

After 3147 BC we have a report of extended combat between two or more Gods. As Jupiter chased Saturn, and perhaps Neptune and Uranus also, the planets could be seen to battle over supremacy, resulting in a massive fireworks display as streams of plasma played across the sky. Jupiter had developed a plasma tail outpouring at the first moment of its removal from its normal orbit.

The image of Jupiter in the south skies would have been stupendous in size. A glowing round globe -- the coma surrounding Jupiter -- stood about halfway up into the sky from the south horizon, traveling on the ecliptic. Below the globe was a green mantle which extended all the

way to the horizon below, and above were what looked like a head with a feather headdress, which might also be described as horns. The horns are formed from the upper flower shaped coma, where only the denser plasma at the edges was seen. But more noticeable was the equatorial toroid of glowing plasma within the coma of Jupiter. Of this the left and right cross section -- where the toroid was most dense -- stood out as two eyes staring back at the humans. More on this further below.

We do not know how large the coma of Jupiter was originally, but later estimates suggest a diameter of three million miles, more than three times the diameter of the Sun, but of course located much closer to Earth at first. The coma could initially have occupied 30 or 45 degrees of the sky (at distances of 4,000,000 or 6,000,000 miles). From later snippets of the Egyptian *Book of the Dead* we often get the feeling that the Gods of Egypt were absolutely huge in size, although far removed. This is an instance of the giant Gods. But the images in the south skies receded rapidly, diminishing in size steadily, and especially since Earth also continued away from the "impact" location much faster than the travels of the other planets, since Earth was on a much smaller and faster orbit.

The large outpouring representing the mantle was the plasma plume at Jupiter's north magnetic pole, which is located at its south (lower) geographic pole. From a number of sources it is clear that it was colored green -- which is how the mummified Osiris is nearly always depicted. (At a much later date, both the coma surrounding the planet and its lower mountain form were red instead.) Vedic sources of uncertain dates recall a green body for the God but wearing a red mantle.

A much smaller funnel-shaped plasma appeared above Jupiter, suggesting horns where the edges were most dense. In this form, this was the "Bull of Heaven" who had destroyed the home of the Gods. Colored green and mostly immobile (as an outer planet, Jupiter would have moved through the skies much slower than Earth), Jupiter was identified as the standing mummified body of Osiris. His worship, however, did not seriously start up until the end of the fifth dynasty (circa 2350 BC), following, in effect, shortly on a time span when "Re" (who is also Jupiter) was worshiped again -- actually, directly after the appearance of Jupiter at the fall of the Absu in 2349 BC. This sequencing of who and what were seen in the skies after 3147 BC will be addressed again in a later chapter.

Like the ithyphallic God Min, statues of which, dating to 3100 BC, have been found in the delta, Osiris is frequently depicted with an erect penis. It seems strange to have a plasma extrusion sticking out at right angles from the mantle (or what would later be known as a mummified form). Of course this would be along the direction of the plane of the ecliptic, so we can suggest the plasma tail of a comet or minor planet. I would elect "planet" for in order to be seen at right angles to Min's mantle, the tail would have to extend along the ecliptic. In 550 BC Herodotus, on the basis of what he learned from the priests at Sais, calls Menes, the founder of Memphis and the first king of the first dynasty, Min -- the name of the ithyphallic God current in the delta since circa 3100 BC. Menes is listed both as a God and as a human in the Turin Papyrus. This is Jupiter, and thus it the first mention of Abraham, who

disappears when Jupiter enters the asteroid belt, and is forgotten as Abraham until much later.

Whatever it was that formed the erect penis of Min and Osiris, it could not have existed within the lower plasma plume of Jupiter and simultaneously penetrated it, since a plasma tail directed away from the Sun represents a shadowing of the Sun's electric field. What are we looking at?

I suspect it was Mercury. Mercury was the star form between Saturn and Mars in the previous era: a small planet with a magnetic field (even if minor), and an atmosphere (almost completely gone today), and also today covered only by fresh electric scars.

We are probably looking at a visual superposition of forms -- Jupiter's mantle with Mercury in front. The location is possible, since Mercury was an outer planet until 686 BC. Thus Mercury could have been seen against the background of Jupiter's mantle. They may have been seen 3 degrees separated from each other. The orbit of Jupiter is inclined 1.3 to the ecliptic; the early orbit of Mercury (before 686 BC) was likely inclined 2 to 2.5 degrees to the ecliptic (this is my estimate).

We do not know how long this lasted, or when Mercury disconnects from the image of Jupiter, but the planet obviously came to represent the lost genitals of Osiris. The details of all this are very obscure. The superposition might have happened repeatedly, as Jupiter and Mercury passed each other every two years. In this manner Osiris would have repeatedly shown an erection.

The battle between the receding planets likely occurred some safe distance from Earth, but close enough to have been clearly *seen*. Plato's Atlantis, the land held up by the giant Atlas, sank into the sea in one day and a night. That is an accurate description of the event as the toppling of the land in the north, which was seen sinking into the Absu (the sea) the following night. [\[note 7\]](#)

There are detailed Mesoamerican depictions of the globes of Jupiter and Saturn -- Jupiter shown with its bands and Saturn with its rings. The banded appearance of Jupiter was known in Polynesia also. The number of visible satellites of Saturn and Jupiter are accurately counted as families of Gods by many diverse peoples.

From Hesiod we have the account of Zeus (Jupiter) in a battle over supremacy with a generation of older gods, Kronos (Saturn) and the Titans, the giant trans-Saturnian planets Uranus and Neptune. When, in the 19th century AD, these two very large planets were discovered beyond Saturn, they were named according to Greek mythology. In Greek mythology Saturn and the Titans were banished to the outer reaches of the Underworld -- the zodiac in the south sky -- by the new Chief of the Gods. The losers in the battle could be seen diminishing in size, to eventually become mere pinpoints of light, and lost track of. Saturn, however, was tracked and accounted for during all of antiquity, on every continent, despite

the fact that it is indistinguishable from a star and takes 30 years to circle around the zodiac.
[\[note 8\]](#)

We should also not underestimate the extent of the battle, much of it "fought" with flung thunderbolts. Hesiod's description of Zeus is probably an understatement.

*"Hurling his lightning:
The bolts flew thick and fast
From his strong hand
Together with thunder and lightning,
Whirling an awesome flame."*

-- Hesiod, *Theogony*

Hesiod's writings are a recollection made 2300 years later. But even later than this there are Greek and Roman writers inquiring into the mechanics involved in these interplanetary lightning strikes. The last lightning strikes between planets (between Mars and Earth and between Venus and Mars and the Moon), were witnessed in the 8th century BC. This was followed by one more massive bolt (and additional lesser bolts) from Jupiter to the Sun in 685 BC. Planetary thunderbolts were still being discussed by Greek philosophers 300 years later. [\[note 9\]](#)

Hesiod describes two distinct battles, the first with the Titans, the second with assorted monsters. The first battle is frequently recast in mythology as a conflict between the chief God and a dragon or snake. Jupiter (Zeus, Marduk, or other primary God) hurls a spear (or trident) down the throat of the snake to kill it. The attacking snake might have been Saturn, but it is very unlikely. The lack of any display of a plasma tail, and as a result the lack of any mythological forms of this sort, can be attributed to the large positive charge of Saturn and its closely held coma.

I think this event, involving a snake or dragon, is probably misplaced. Mythology tends to fuse separate celestial experiences into singular events. (As do mythologists.) I think the battle with a snake or dragon should be placed in 2349 BC when Venus makes electric contact with Earth. The trident could be assigned to the era following directly on the end of the "Era of the Gods" when Jupiter hurls plasmoid thunderbolts (described below) at the Titans and obliterates objects in the asteroid belt. The trident thunderbolt *per se* clearly dates to 685 BC, and is reproduced in sculptures, murals, and coins after that date.

... monsters of the asteroid belt

A snake or dragon was seen at one time, however, and it was reputed to have had an enormous head. David Talbott summarized the curious worldwide fusion of a wildly maned lion and snake imagery as follows:

"Why did ancient symbolists so frequently combine serpent and leonine features in a single monster? We see this juxtaposition in the Greek Chimera, with the head of a lion and a tail in the form of a serpent. The Chinese 'lion' has the countenance of a dragon, while the Chinese 'dragon' possesses a distinctively leonine mane. The Egyptian Goddess Tefnut appears as the Uraeus serpent, but in her terrible aspect becomes a giant lion head, with 'smoking mane.' The Mesopotamian dragon Labbu was a snake, but its name means 'lion.' The Sumerian Goddess Inanna was the 'lioness' of heaven, but in her rage became a fire-spitting serpent or dragon devastating the land. In Orphic theology, the god Phanes was born from an egg as a winged snake, though he grew the head of lion. 'Snake of the Lion' was the name of a Mixtec creator god."

-- Thoth Newsletter (2002), [\[othergroup.net/thoth\]](http://othergroup.net/thoth)

I think much of the descriptions here applies to events of 2349 BC, which will be described in following chapters. But just as the lion-serpent image is described as consisting simultaneously of water and fire, so any plasma discharge in arc and glow mode will take on solid-looking shapes and must have struck terror into the hearts of the humans watching the battle from the vantage point of Earth. The plasma thunderbolt exchanges, however, were diffuse enough to leave the rings and satellites of the planets intact through the confrontations.

These descriptions, such as the monsters listed above, may have their genesis in the movement of the four planets through the asteroid belt, and the further electric discharges from Jupiter to the asteroids, and thus represents the second battle with the misshapen monsters described by Hesiod. Evidence of the conflict is shown in the scars, burns, and "impact craters" covering every side of the thousands of remaining asteroids. Every asteroid (or comet) that has ever been inspected by a space satellite has been found to be pockmarked with these craters, sometimes nearly equal to the diameter of the target bodies. The same circular "impact craters" exist by the millions on the Moon, Mars, Mercury (but due to much later electric contacts), and virtually every satellite of every planet. The electric arcing must have launched billions of tons of dust into the surrounding space, making all of the ecliptic glow with light reflecting off dust (universally described as a yellow river or golden highway of the Gods), and causing many of the thousands of asteroids to start exhibiting cometary comas and tails in the suddenly altered electric conditions of the asteroid belt. [\[note 10\]](#)

It has been proposed by some that the asteroid belt is the remnant of the battle between Jupiter and Saturn. However, the breakup age of the asteroid belt dates from 3.2 million years ago with a spread of values dating to 40 million years ago. Some date to 300 million years ago, or more. Thus the belt existed long before 3147 BC when Jupiter and Saturn (and Neptune and Uranus) started to move through the asteroid belt *en route* to their present locations at 5.2 AU and 9.5 AU.

The "impact craters" are anode burn marks caused by plasma discharges and by interplanetary lightning bolts -- electric discharges in arc mode. With an increased level of

dust in the ecliptic, due to the initial violent interaction between Saturn and Jupiter, plasmoid lightning bolts were hurled and traveled very long distances. The plasmoid bolts (which disconnect from the originating body, and then contract to look like a contained object hurtling through space) cause circular depressions of molten rock. The shapes of these plasmoid bolts are depicted in statuary and as models worldwide as late as the beginning of the current era. They are shown as twisted shafts with a ball and trident at both ends.

[\[note 11\]](#)

Continuous plasma arcs, composed of rotating rope-like electric currents (Birkeland currents), on the other hand, leave flat bottomed round "craters" generally with raised centers and perforated edges. Nearly all the "impact craters" were created five thousand years ago by the "thunderbolts of the Gods" and by plasma discharges in arc mode.

... Mercury

In later Egyptian mythology the planetary interactions after 3147 BC are understood as the battle between Jupiter as Osiris and Saturn as Seth, or the reverse of this. The assigned names vary with the temples of different nomes (districts). One late Egyptian source off-handedly lists the battle (and periods of "negotiations" among the Gods) as lasting for 80 years. By one account the "pupil of the eye" was lost; by another Osiris lost his genitals at the end in the turmoil, reminiscent of a passage in Hesiod's *Theogony*. The "negotiations" are the sight from Earth of the known planets bunching together in the same location of the ecliptic, which would happen periodically and more frequently than today. [\[note 12\]](#)

Mercury (Thoth of the Egyptians) also was a survivor of the encounter between Saturn and Jupiter, and was (apparently) first noticed at this time. Mercury is somewhat larger than our Moon, represented in later Greek iconography as Hermes with winged sandals and a winged hat, carrying the Caduceus -- two snakes entwined on a staff below a winged disk. Mercury, because of its smaller size and weak magnetic field, would have had only a limited plasma tail -- certainly not the 30 million mile plasma tail identified as the hair of Isis (Venus). Mercury certainly was part of the stack of Saturnian planets, at least since late in the European Magdalenian (17,000 to 14,000 years ago), and occupied a position between Saturn and Mars. [\[note 13\]](#)

Mercury obviously also was on a very elliptical orbit, as it still is today -- a much different orbit than today, one which overrode the orbit of Earth. Mercury in remote antiquity was very busy.

... Jupiter

The coma outlining the equatorial plasma belt of Jupiter, seen at a distance, would have looked like an owl, with its immobile staring eyes and a plasma tail body extending below

the planet. This is a motif which becomes the owl totem of Athena and shows up as petroglyphs throughout the world, as talismans in the design of horse bridles and pectorals, and even on coins (at a later date).

[Image: Left, carved ivory Amulet, Anatolia, circa 3100 BC. Center, carved petroglyph, China, circa 3000 BC. Right, silver coin of the city of Athens, inscribed A-Th-E, "of Athens," circa 500 BC.]

The ivory "Eye mask" or "Eye Icon" amulets show up stored by the thousands in Northern Mesopotamian caches shortly after 3100 or 3000 BC, and appear also as engravings on the walls of barrows and as thousands of petroglyphs worldwide. Of the ivory amulet, three hundred complete and thousands of broken pieces have been found. The eyes likely represent the view of a toroidal plasma surrounding Jupiter. The body is the giant plasma tail extending from the south pole. The inscribed ibex and plow are symbols from the previous era.

"[Talbot] drew attention to what he called the 'eye mask.' ... He had collected a series of 'eye mask' images, ranging from Easter Island in the southern hemisphere to North America, Europe, ancient Mesopotamia, and elsewhere. From the global distribution he had deduced that the formation was seen from both hemispheres. [Anthony] Peratt immediately identified the eye mask as a 'low opacity torus' or thick ring, seen from a vantage point substantially off-axis, not too far from the plane of the torus. The most intense currents in a plasma torus are concentrated at the center and surrounded by a number of concentric 'shells.' Because the outer shells have a low opacity, an observer can see deeply inside the torus. The center of the toroid cross section becomes more visible at optical wavelengths as the outer plasma shells become less opaque. In addition, the toroid tends to flatten with increasing current, a characteristic revealed by innumerable instances of the eye mask globally and as seen in the ancient Sumerian symbols of the goddess Inanna."

-- David Talbot and Wallace Thornhill, *Thunderbolts of the Gods* (2004)

That "the formation was seen from both hemispheres" speaks to the fact that we are not seeing something in the north skies above the pole. Jupiter with his owl-eyes was seen anywhere the ecliptic could be seen -- at least during those months when Earth on its own

orbit passed Jupiter in its slower travel on its orbit.

The eye masks might be "the ancient Sumerian symbol of the Goddess Inanna" but it dates to after 3147 BC, and should be associated with Jupiter -- at least, so I will claim. Of note is the permanence of symbols: 3000 years later the owl eyes show up on silver coins minted by Athens, as the symbol for Athena (as shown above). It is not Venus, however, unless it be suggested that Venus had a magnetic field. Only if Venus had a magnetic field, could it have developed a toroidal form at its equator, and flower forms at both poles.

The eye mask is Jupiter, in limited plasma discharge because it was still close to the Sun. As Jupiter moved into the asteroid belt, its coma became much smaller, and the view of the equatorial toroid vanished from view.

There is a Maya glyph, meaning "Venus rising," which looks identical to the face of the eye-icon in having two eyes under a single wavy shaped eyebrow. It is often used as a frieze in buildings. In some of the codexes it is used as a label to designate a celestial form -- a planet.

To most of the world Saturn is the loser and Jupiter is clearly the victor. He is a younger God, never seriously noticed before 3147 BC, but since that time held by many peoples to be a resurrection of the older God Kronos. Widely named "the younger," he replaces the older God of Time and Beginnings, Kronos or Saturn. He is Zeus, "youth" of the Greeks, or Jupiter, "father youth" (Jove Pater) of the Romans.

The Absu and Duat

This was the first time humans had seen anything of interest in the south sky in thousands of years (the original Peratt column had vanished in 8347 BC). The planet battle had started in the northern skies, but as the Earth spun away from Saturn and Jupiter, the battle scene would have shifted to the ecliptic in the southern skies.

At first it might have been the sight of two globes of equal size and a separation of a few diameters, surrounded with sheets of plasma and the massive outpouring of plasma below Jupiter. Egyptian "myths" suggest that the two planets at some point drifted away from each other. In effect the coffin of Osiris floated down the "river" of the ecliptic -- north toward Biblos (which is the correct direction).

From representations in Mesopotamia it appears as if the plasma in glow mode at the bottom of Jupiter was absolutely huge, and deserves to be called a "mountain." The *Popol Vuh* simply calls Jupiter "mountain." The coma of Jupiter may thus have completely obscured whatever changes Saturn was undergoing, and in fact we hear nothing of Saturn.

The rotation of the night sky would move the battle from east to west, the change of seasons would move it further up and down in the sky, and the rotation of the year would bring it

closer in and move it further away. As the receding planets diminished in size, the battle had moved into the night sky to the region of the Absu or the Duat -- the ocean in the southern sky. [\[note 14\]](#)

The destruction wrought by Jupiter with plasma bolts in the asteroid belt (Hesiod's second battle) would have left dust and debris strewn along the ecliptic, causing the "path of the Gods" to be marked like a highway, defining the road of the Sun and the planets -- the zodiac. The lighted zodiac (the ecliptic) was last seen from Earth in AD 1840. [\[note 15\]](#)

Because of the disappearance of the planets into the far reaches of the Zodiac, the southern sky became known as "Lower Earth" (as opposed to "Middle Earth," where we live) and is eventually designated as the "Underworld" -- the graveyard for dead Gods and soon, by extension, as the place to which humans go at their death. By the time of the first editing of the "Iliad," in about 500 BC, the Underworld has moved below ground.

Some of the debris created by Jupiter might have reached the vicinity of Earth, and started to fall toward the planet. This would have been gases, ionized dust particles and particulate matter. There might have been a continuous infall of dust near Earth or it could have been periodic as the Earth swept through the clouds of this matter which may have orbited the Sun. The falls of material into the upper atmosphere would have caused patterns of concentric circles and spirals to appear during the nighttime, and, in fact, these were recorded in profusion on the boulders of megalithic barrows after 3100 BC. Similar spirals and concentric circles have been recorded in modern times in the night skies from disturbances of the upper atmosphere by high altitude rockets -- perhaps from the exhaust gases. [\[note 16\]](#)

Some of the debris would remain as part of a series of rings around all the larger planets. Earth also would have ended up with its share of dust and suspended rocks.

In Akkadian times (after 2345 BC), in Mesopotamia, the name for the village of Babylon was misunderstood by the invading Akkadians as "The Gate of the Gods" -- that is, the doorway through the Absu. Subsequently, Babylon became the most important ceremonial center in all of the lands of Akkad and Sumer, a position held for the next 2000 years.

The rings of the Absu disappeared, rained down upon Earth or drifted out to space, after 2349 BC, in what will later be known as the "flood of Noah," with the last and most distant ring remaining, I suspect, to perhaps AD 600 as the Ouroboros. More on this in the following chapters.

I should note again that once the reader knows of the Absu, many statements and descriptions from remote antiquity, which have reference to an ocean, a sea, a number of rivers, or a seven-headed snake, all of a sudden take on meaning and start to make sense. The concept of an ocean in the south skies remained even long after the Absu had disappeared.

I should add one note on the destruction of the northern polar configuration, and its effects on

Earth. Humans certainly were aware of the cataclysm. On the Palette of Narmer, Jupiter is shown as the bull who destroys the walls of the city of the Gods. The flooding from the south would have devastated many coastal regions, and in many locations completely wiped out all of the human population. But many other regions were unaffected. Egypt was certainly one of them.

And overall there would have been no geological effects -- no earthquakes or shifting mountains, no forces applied from the exterior, impacting bolides, or explosive detonations of planetary thunderbolts. Any change in the orbit of the Earth would have been in translation -- that is, a left-right and up-down movement -- which cannot be felt, just as today we do not notice that the Earth is circling the Sun. The only catastrophe was the flood.

Endnotes

Note 1 --

The fact that the high tide stood at the South Pole, rather than the North Pole, is correct. The exterior planet pulls up the crust of the Earth, and has little effect on the ocean water. What happens, in fact, is that the ocean water runs off of the raised crust. Almost all textbooks which attempt to explain tidal action are in error to suggest that the Moon pulls up ocean water.

Details of information on a worldwide flood is taken partially from an article by Charles Ginenthal, "The Flood" in *The Velikovskian* (1994), and partially from other sources. The action of the oceans and translational waves rushing onto continents has been adjusted for the simple mechanism of the sudden release of an extremely high standing tide at the South Pole, the South Atlantic, the South Pacific, and the Indian Ocean. There is no need, as others, including Ginenthal, have suggested, of a polar relocation of the Earth and the translation of continents to different latitudes.

Saturn, with a mass 3000 times that of the Moon, would, even at a distance twice that of the Moon, exert a tidal pull (on the Earth's crust) 350 times stronger than the Moon does today. However, it would still be insignificant compared to Earth's gravity and the pull of Saturn would not suck water away from Earth, as was thought at one time. The calculations below compare the tidal pull (gravitational attraction) of the Moon, Saturn, and Earth. The formula below is Newton's $F = (K m' m) / (r^2)$ using as the mass of Saturn 100 times the mass of Earth, and for the Moon 1/10th the mass of Earth.

Moon: $0.1 / (243000^2) == 0.0169$
Saturn: $100 / (409000^2) == 5.9$
Earth: $1 / (4000^2) == 625$

The units have no sensible measure (and $10 \exp -10$ is not shown), and are only shown for comparison. Normalized to the tidal pull of the Moon, the numbers would be:

Moon: $0.0169 == 1$
Saturn: $5.9 == 349$
Earth: $625 == 36982$

The calculation above shows that if the Moon today can raise tides 10 to 20 feet (7 meters) high, then if we multiply by 350 we get a height of 0.5 to 1.5 miles for the Antarctic "tide." In reality the tides attributed to the Moon only represent the movement of ocean water, and thus the "10 to 20 feet" mentioned above cannot validly be used as a comparison.

The amount of an uplift of beaches in South America increases toward the south. It is on the order of 1000 to 1300 feet (430 meters) in Chile. But beaches raised by a thousand feet also occur elsewhere, as along the east coast of New Zealand (where the height also increases toward the south) and along the south shores of California.

Raised beaches throughout the world are impossible to use as an index of seismic activity. They vary from 30 feet to 1500 feet (500 meters), and might represent the raising of land as easily as the lowering of the sea levels. As an example: When the glacier covering Norway melted, the land under the glacier rose (rebounded) with the result that the region of the Baltic and North Sea, which had ballooned upward due to the pressure of the northern glaciers, and were for a long time free of sea water, lowered to be covered by water.

A high tide stood at the south polar regions for thousands of years. This would leave behind beaches at a higher elevation. Ocean water in the south would have stood higher from circa 10,500 BC until 3147 BC.

The lost beaches we are looking for would all be under water instead. Archaeologically these can be found off the coasts of India and Japan (both with submerged man-made structures), but also very interesting are the dolmens and henges at the Atlantic coast near Carnac, which are now under water. These last were certainly not built before the end of the last ice age, which is often suggested for sunken Neolithic ceremonial structures.

One of the related questions is how tidal organisms -- clams, sea anemones, oysters, crabs, and others -- could have adapted to tides in only 5000 years (that is, since 3147 BC). Rachel Carson, in *The Edge of the Sea* (1955), convincingly demonstrates the dependence of most of the seashore creatures on the high, low, and seasonal tides for reproduction and relocation.

There were no lunar tides before the Moon showed up after 2349 BC (as will be related later in this text), although there were solar tides, and daily tides due to the off-center presence of Saturn. In 7000 years before Saturn, as I have suggested, the rotational axes of Earth and Saturn never aligned, so that the Earth would have been subjected to daily tidal forces. Away from Saturn after 3147 BC, the Earth would still have been subjected to tidal forces due to the Sun (which is a major element today), and more so if it is considered that the Earth was on a smaller orbit.

The concept of the "tidal forces of the Moon" is frequently brought forward as an argument against the late appearance of the Moon. So are data which show that coral growth has always and forever been at a rate of 365.24 rings per year, although I have also seen much discrepant data.

[\[return to text\]](#)

Note 2 --

There is no evidence of a hunter/gatherer population in most of India. These people may have

been swept off the face of the Earth. The Siwalik hills include surface deposits of Acheulean hand axes and bi-faced cleavers, in addition to choppers made from broken pebbles. These are normally attributed to the Upper Paleolithic, and thus represent a pre-neolithic industry, with some archaeologists attributing the tools to *Homo erectus*. On this basis the dating of the Siwalik fossil assembly is placed at 125,000 years ago. The fossils of animals do not match these estimates.

"The Siwalik Hills on the southern edge of the Himalayas consist of sedimentary deposits 2,000 to 3,000 feet (1000 meters) high and extending for several hundred miles, abounding with fossil beds of so many and so varied species that the animal world of today looks impoverished by comparison."

-- James Hogan, *Kicking The Sacred Cow* (1999-2007)

A similar condition exists in Northern Burma. In both cases there is low-laying land providing a clear path of tsunami access from Antarctica via the Indian Ocean. The mounds of bones in Burma are interleaved with layers of mud, which would be expected when a wave comes to a standstill and suspended material starts to sink. Probably the mud layers were produced by secondary waves.

Along coastal India there are many architectural archaeological sites deep below oceanic waters. See, for example, Graham Hancock, in *Underworld* (2002), who lists many underwater sites in India and Japan. Hancock places the blame for the submerged sites to glacial melting before circa 10,000 BC. I would suggest the submersion was due to a leveling of the oceans in 3147 BC.

[\[return to text\]](#)

Note 3 --

Although suspected of being windblown and the result of glaciers grinding rocks to a fine dust, the actual source of loess remains uncertain. Glaciers do not grind rocks to silt, as the pebbles of terminal moraines testify. Similarly, windblown dust does not remain unoxidized. Loess contains no organic material. The following is the "accepted understanding," which is mostly descriptive:

"Loess is mixture of silica and clay, with particle size ranging from 0.1 mm down to 0.005mm [small!]. Where loess is unoxidized, it has a greyish color, but may also be yellow, orange, or brown because of presence of ferric oxides. Deposits of loess occur in North America, Europe, Russia, Siberia, China, and also in Argentina and New Zealand." -- D. A. Cyr, *Annular Space Dust* (1968), paraphrased by A. de Grazia.

"Loess is an aeolian sediment which forms by the accumulation of wind-blown silt and lesser and variable amounts of either sand or clay. Glacial loess is derived from either glacial or glacial outwash deposits, where glacial activity has ground rocks very fine."

After drying, these deposits are highly susceptible to wind erosion, winnowing of their silts and clays, transportation of these sediments, and deposition some distance downwind from glacial deposits. The loess deposits found along both sides of the Mississippi river Alluvial Valley are a classic example of glacial loess."

"The thick Chinese loess deposits are classic nonglacial (desert) loess with their sediments having been blown in from deserts in Northern China. The loess covering the Great Plains of Nebraska, Kansas, and Colorado is nonglacial desert loess. Nonglacial desert loess is also found in Australia and Africa." -- Wikipedia

The reader may recall the wide spray of sand resulting from the lightning bolts which pulverized the depths of the great Lakes in 10,900 BC. Electric arcs look to be a more likely source for the loess, including China.

Note 5 --

I suspect that the Moon was seen in an orbit about 4 million miles farther from the Sun than Earth. At that distance, however, it would have looked more like a large bright star. Hesiod writes that the Moon showed up after the defeat of Uranus ("Father Sky"), but only after a very long time. It would also be easy to mistake the globe of Jupiter (when it was still orbiting the Sun at 0.7 AU) for the later image of the Moon. Mesoamerica seems to have done this as shown by the history engraved in monuments at Palenque. At Palenque, the Moon is the mother of all the planet gods.

I suspect that after the fall of the Absu in 2349 BC (covered in the following chapter), an amount of dust remained in orbit at a considerable distance from the Earth, located exactly above the equator of Earth. This might represent the necklace set as a sign in the skies by the Sumerian Goddess Inanna. This remnant of the Absu was red, however, and Inanna's necklace was the cyan of lapis lazuli.

Note 6 --

As related by Robert W. Bass, in "The Titus-Bode Law from 1766 to 1996" *Pensee* (1996), "Zecharia Sitchin, in *Divine Encounters* (1996), ... displays the drawings on an Assyrian cylinder seal which shows an asteroid belt between Mars and Jupiter, and shows Saturn with rings!"

[Image: Cylinder seal: Jupiter on a throne with a planet and 11 satellites. After Sitchin.
]

The seal image above which shows Jupiter enthroned, with an adjacent pointed star form, which likely is Jupiter, ringed by 11 smaller round balls of different sizes. (On the web there is a portrait of Sitchin holding a greatly enlarged version of this seal.)

The below graphic is a reproduction of the star and its 11 satellites (by others). The table below relates all the satellites of Jupiter to the depicted diameters of the spheres, except the dozens of tiny satellites discovered by spacecraft in recent years. Additional established larger satellites are shown separately below.

The small balls are most likely meant to be the satellites of Jupiter, although there are two additional satellites in addition to the ones which are normally easily seen. Graphic traditions for two-dimensional surfaces in antiquity revolved on the depictions of recognizable detail without concern for actual dimensional relationships.

[Image: Jupiter with 11 satellites. Diagram after Sitchin]

Satellite	Distance (km)	Radius (km)	Mass (kg)	Discoverer	Date	diagram
Ganymede	1,070,000	2631	1.48e23	Galileo	1610	9

Callisto	1,883,000	2400	1.08e23	Galileo	1610	8
Io	422,000	1815	8.94e22	Galileo	1610	7
Europa	671,000	1569	4.80e22	Galileo	1610	12
Amalthea	181,000	98	7.17e18	Barnard	1892	11
Himalia	11,480,000	93	9.56e18	Perrine	1904	4
Thebe	222,000	50	7.77e17	Synnott	1979	3 *
Elara	11,737,000	38	7.77e17	Perrine	1905	6
Metis	128,000	20	9.56e16	Synnott	1979	2 *
Lysithea	11,720,000	18	7.77e16	Nicholson	1938	10
Adrastea	129,000	10	1.91e16	Jewitt	1979	5 *
* -- not likely part of the nine from antiquity						
Remaining satellites (mostly very large orbits)						
Leda	11,094,000	8	5.68e15	Kowal	1974	smallest
Pasiphae	23,500,000	25	1.91e17	Melotte	1908	too far
Sinope	23,700,000	18	7.77e16	Nicholson	1914	too far
Carme	22,600,000	20	9.56e16	Nicholson	1938	too far
Ananke	21,200,000	15	3.82e16	Nicholson	1951	too far

The last column lists the numerical representation in the diagram above. There are some discrepancies, such as, for example, the fact that Io (number 7) should be much closer to Jupiter than Ganymede and Callisto. On the other hand, Amalthea (number 11) and Thebe (number 3) are appropriately shown as much closer to Jupiter. But, again, Metis (number 2) and Adrastea (number 5) are sized right, but located too far from the planet. But the graphical presentation is reproduced in about 2850 BC from records dating from shortly after 3147 BC, when these satellites would have been seen close up.

In circa 2860 BC Jupiter would have entered the asteroid belt at about 2 AU, obscuring the satellites for the next few hundred years. The satellites certainly could be seen up to about 2 AU. This distance is about one third of the distance to which Jupiter would eventually travel and so is equivalent to being seen at three power magnification with a telescope, as Galileo used in his discovery of the four larger satellites.

Amazingly, three of the listed satellites are at 11,000,000 kilometers. One of the surplus satellites is also at this distance, but it is very small. All the other additional satellites are at circa 22,000,000 kilometers and likely would never have been noticed.

As the Sumerian flood story has it (as retold in the *Epic of Gilgamesh*), "the gods gathered like flies over the sacrificer." These are the flies.

There are very obvious similar depictions of the atmospheric bands of Jupiter, shown as a turban headdress (not shown in this seal). The banded headdress of Marduk (who is Jupiter) shows up on later Babylonian era cylinder seals.

The depiction of an anthropomorphized Saturn (or Kronos) encircled by rings extends to Roman times. No other God is ever depicted as bound by rings.

[\[return to text\]](#)

Note 7 --

Plato's Atlantis is the only instance of the "Atlantis legend" in antiquity. If the Atlantis legend was current in Greece or Egypt, we would have heard about it from many other sources, although *Hamlet's Mill* (1969) by Giorgio de Santillana and H. von Dechend recounts

hundreds of versions of this legend worldwide -- of a land held up by a giant, a tree, or a river rising in the sky. The tree, river, snake, bridge, or giant at some time in the past was cut down, and the land sank into the sea. That can be placed at 3147 BC. The "sea," of course, is the Absu of the south into which all the planets, but especially Saturn ("the land"), disappeared.

Plato's date of 9600 BC is the weakest link in his story. An old man (Critias) has to go home to think over what it was that he might have heard his grandfather tell of what *his* father had heard tell by Solon when he was a little boy. Plato actually places Atlantis in the Gulf of Guinea, west of equatorial Africa. As seen from Greece, this is a sightline for the southern plasmoids, which rotated into view to stand over South America. Thus it could very well be suggested that Atlantis represents the ball plasmoids of the south. Atlantis was ruled by the water god Poseidon and his two queens.

Note 8 --

Hesiod, in the *Theogony* (circa 650 BC). See the translation by Norman O. Brown, and especially the introduction by the translator, as published by The Library of Liberal Arts, Bobbs-Merill Co (1953). The *Theogony* recapitulates the period with which these pages deal, from the creation through the end of the "Era of the Gods."

The planet Uranus ("Father Sky") is misnamed by Hesiod, for he is the cloud-shrouded sky or, more likely, the duck seen therein with the egg next to the duck. He is thus the father of Kronos (Saturn).

[\[return to text\]](#)

Note 9 --

During the early years after 3147 BC, the Egyptians are uncertain to whom among the celestial apparitions they owe allegiance. The names of a number of "kings" come forward, of which King Narmer seems to have had some extended claims. His name-serekh is found throughout Egypt and the Levant as labels on wine jars and other products, destined for delivery to the temple at Nekhen. The name-serekh, Nar-mer, consists of the glyphs for "catfish" and "drill" (or "chisel").

The glyph for "catfish" has the shape of a toroidal thunderbolt (a plasmoid), in all the instances I have seen. See for example the illustrations of serekhs, accompanying the text "Dynasty 0" by Francesco Raffaele (2002) at xoomer.virgilio.it/francescoraf/hesyra/dynasty0.htm. In one instance this is depicted with a rope-like twisted body. The Nile catfish has only a two-pronged tail, but has the typical large feelers protruding from its head, making it look like a trident.

The "catfish" is the plasmoid thunderbolt which Jupiter explosively launches at the Titans

and various objects in the asteroid belt. The "chisel" describes what the catfish shaped bolt does: it produces a spray of material like a chisel striking stone, something with which the Egyptians were familiar from their industry of stone jars and platters.

[\[return to text\]](#)

Note 10 --

The main asteroid belt is located beyond the orbit of Mars and halfway to the orbit of Jupiter -- from about 2 AU to about 3.5 AU. Jupiter is at 5.2 AU. There are additional asteroids traveling within the space of the inner planets, as well as beyond Jupiter.

The orbits of the asteroids today are still very chaotic and many asteroids are on elliptical orbits. Frequently some of them will develop a cometary coma in moving from aphelion to perihelion. These objects are subsequently classified both as a comet and as an asteroid.

The belt is generally thought to be the remnants of a planet, sometimes called Krypton. A planet can blow up during a time of severe electric stress when electrons rushing outward from the interior disrupt the lattice of the structure. Similarly, bolides nearing Earth often explode and fragment on reaching the Earth's ionosphere -- not the atmosphere. They are seen to fracture but are not heard.

[\[return to text\]](#)

Note 11 --

The largest piece of missing evidence in the "impact theory" presented to account for all the various craters on asteroids, satellites, and planets is the lack of the impactors. Not a single asteroid is moving at anything except a crawl with respect to any of the other asteroids. There is very little difference in the speed of travel of objects traveling at the same distance from the Sun.

Gravitational forces between the Earth and an approaching asteroid will increase the speed to a value on the order of 25,000 miles per hour. The Moon will accelerate an asteroid to about 5000 miles per hour. Two asteroids meeting under conditions of gravitational attraction, however, would just ding each other.

[\[return to text\]](#)

Note 12 --

Osiris is probably Jupiter, looking like a draped figure, but Osiris may also be understood as Saturn. The "eye," which is lost, might be the whole Saturnian polar structure with the rings outlining the eye, in effect the "Eye of Ra." The eye might also be the pupil of the eye -- that is, Mercury and Mars.

The removed genitals are attributed by Hesiod to the castration of Uranus (the primordial

"Father Sky") by Kronos (Saturn). They "floated for a long time," says Hesiod, spilling blood on the sea, from which eventually arose the Moon. The "sea" is the "waters above" -- the Absu, not the Earth's ocean. The Moon only arose (out of these waters) after all of the Absu had turned to blood in 2349 BC. See a later chapter for these details.

[\[return to text\]](#)

Note 13 --

The Turin Papyrus of circa 1200 BC gives Mercury (Thoth) a "lifetime" of 3126 years. The extremely long life assigned to Mercury may be due to his changing responsibilities over time and certainly due to his constant visibility. The statement also needs to be understood as the lifetime up to that time, that is, up to circa 1200 BC.

In the second millennium BC, when in effect Mercury was the only remaining active planet, his duties (as Thoth) were extended to include creation, and thus his lifetime needed to be counted from the very beginnings. If the Turin Papyrus indeed dates from circa 1279 BC to 1213 BC (the reign of Rameses II), then, subtracting 3126 from 1279 BC places the birth of Mercury in circa 4400 to 4300 BC. This is roughly equal to my estimate (4077 BC) of when Saturn went nova and the coma dropped to reveal its satellites and companion planets.

Working backward instead we would date the Turin Papyrus in 951 BC ($4077 - 3126 = 951$).

The two small circles of stone within the large Avebury henge and a number of other henges (including Stonehenge), might suggest two planets below the south pole of Saturn. We have no idea of why these would have been offset from each other to give this particular depiction, or even if the depiction of two objects seen below was intended in the construction of Avebury, especially because the whole of the circular sets of standing stones apparently date to after 3100 or 3000 BC.

As a sub-polar Saturnian planet, Mercury (like Mars) would have remained with Saturn, not to be released until Saturn reached the asteroid belt, and Saturn's gravitational sphere of influence shrank in the presence of the asteroids. Both of these planets would have immediately started to "fall" toward the Sun, and thus establish orbits with the Sun as one center, and the edge of the asteroid belt as the aphelion of the orbit.

The word "released," as used above, is probably incorrect, but sort of sums up what might have happened. A change in the shape of the plasmasphere of Saturn (as it entered the asteroid belt) is certain -- the change in form will be seen and recorded for the planet Jupiter too.

Ev Cochrane, in "Martian Metamorphoses: The Planet Mars in Ancient Myth and Religion" (1997), identifies Apollo (which I claim to be the planet Mercury in antiquity) with the planet Mars (under various names like Aries or Nergal) in that they both are seen as the cause of plagues and have reputations for destructiveness. The cross-identification of attributes in

antiquity is correct, although it has been difficult to establish the destructive nature of Mercury. Both Mars and Mercury apparently moved together from deep space into the region closer to the Sun, coming close to Earth in the process (as I will establish in later chapters). Homer still deals with Apollo as Mercury in the 7th century BC.

Velikovsky, in an unpublished document, "Mercury" (at varchive.org), notes in a footnote that Mercury was active in the second millennium BC, and quotes from the Bhagavatamrita that "Budha [Mercury] became visible the 1002nd year of the Cali yug." The Kali era (Cali yug) started in 3102 BC. The 1002nd year is 2100 BC, and thus likely represents the return of Mars and Mercury starting in 1936 BC (resulting in the destruction of Sodom and Gomorrah).

Mercury is made responsible for the Tower of Babel incident by Velikovsky. He quotes the writings of Abraham Rockenbach, who in "De Cometis Tractatus Novus Methodicus" (1602), places the Tower of Babel incident in 2060 BC. I have a somewhat earlier date of 2150 BC, which I will detail in a later chapter (and make Jupiter responsible for the incident).

In addition to a number of distinctive physical (or symbolic) differences between Mars and Mercury, Cochrane also identifies Mercury with the mythical Hyperborean people who lived in the far north. This is believable, since Mercury apparently wound a much tighter path around the Sun, such that on summer nights, on approach of morning, it could be seen to disappear at a low angle in the northeast (over a period of days), the same location from where the Sun would then rise.

Even if we currently have forgotten, the ancients knew that Mercury was the planet placed between Saturn and Mars, and as a result Mercury was depicted frequently as crowned with a star-shaped plasma seen before 3147 BC. Almost all later depictions of Mercury (as Apollo) show him with this star-shaped halo. After 686 BC, when its atmosphere burned up, the title of Apollo was transferred to the Sun. The participation in 685 BC in a spectacular display of arc mode plasma (the Phaethon event), was the convincing final twist to the transformation.

Note 14 --

About the Duat, E. A. Budge wrote:

"In the XIXth Dynasty we know that the Tuat [Duat, the Underworld] was believed to be situated not below our earth, but away beyond the earth, probably in the sky."

-- E. A. Budge, quoted by Cardona, 1994.

In fact we can be certain that in antiquity the Underworld was held to be located in the south night sky below the equatorial, consisting initially of the circles of the equatorial rings around the Earth. The bright path of the ecliptic was considered a celestial river, congruent

with the "waters above" of the earlier polar apparition. The ecliptic was located both above and below the equatorial, as a tilted hoop in the sky, so that part of the ecliptic dipped into the Absu or Duat (which stood to an altitude of less than 50 degrees in Mesopotamia and Egypt). The ecliptic is the later river Styx of the Greeks, "encircling the lower world." That the lower (southern) heavens would continue under the Earth probably must have seemed obvious.

At the latitude of Mexico City and the Yucatan (about 20 degrees north), the planets on the ecliptic rise out of the Caribbean and plunge into the Pacific oceans at a steep angle. Mesoamerica, as a result, always places the "Underworld" below ground.

In the tropics, closer to the Earth's equator, the Duat would have stood almost straight up in the sky. With the rings and spokes it would have looked like a spiderweb suspended above and stretching from horizon to horizon. It is little wonder, then, to hear that the creation God of Central African tribes is a spider.

[\[return to text\]](#)

Note 15 --

The concept of a glowing zodiac occurs in Chinese and Mesoamerican sources. It is also identified as the river Styx of Greek mythology, which has to be navigated or crossed before entering the Underworld, and, in Egypt, as a similar river to be crossed by the dead Pharaoh.

In encyclopedias dating from the 19th century AD, the glowing ecliptic is still identified as a ribbon in the sky and called the "zodiacal light," and note was made that this was last seen extending across the sky in about AD 1840. Entries in encyclopedias with later publication dates identify the "zodiacal light" as the Sun's "afterglow" ("gegenschein"), a glow due to sunlight on dust particles in outer space, but seen only shortly before sunrise or after sunset.

In the *Encyclopaedia Britannica*, 11th edition (circa AD 1911), it is noted of the "Zodiacal Light ... until recent time was never observed except in or near the zodiac; hence its designation." The article notes that the zodiacal light was 2 to 3 degrees wide, and was not the "gegenschein" of the Sun at dawn or sunset. It further notes the investigation of "... George Jones, who spent eight months at Quito, Peru, at an elevation of 9000 feet (3000 meters) ... [and who] saw the zodiacal band at midnight as a complete arch spanning the sky ... sometimes so bright as to resemble the Milky Way." (Since I first wrote this, the content of the 11th *Encyclopaedia Britannica* became public domain. I initially copied this from a volume at a Newberry Library book sale. By the time of the 15th edition, in 1984, the Zodiacal light was equated with the "gegenschein.")

It would make sense to have the zodiac glowing, even if just from reflected sunlight, if millions of asteroids had been ground to dust -- as had happened when plasma arcs struck these rocks floating in space. The silicates split asunder as the electrons broke their bonds to rush through the material to the location of a plasma contact point. Neptune and Uranus had passed through the asteroid belt to start the process of electric arcing to these objects. Saturn

would have followed to do the same. And last the gigantic planet Jupiter passed through. This last was especially noted by Hesiod.

The dust was ionized and repelled into space electrostatically. We saw this also when the space probe "Deep Impact" fired a projectile at Comet Tempel-1 in 2005.

Thornhill has identified this process as identical to electric arc machining. In vacuum tubes this process (minute particles breaking away from the cathode) is known as sputtering. Under plasma conditions these minute particles, when they find themselves in a plasma environment, will become encased in electrons at glow mode. This has been observed in plasma tubes and described since early in the 20th century. Basically, this is what made the ecliptic glow.

Note 16 --

"Curious Manifestations of Ascending Rockets" from William R. Corliss's *Handbook of Unusual Natural Phenomena* (1977), quoted from *Marine Observer* (1964), AC Browne, et alii.

[Image: Rocket exhaust seen at night. After Corliss.]

All three ships were located off the coast of Africa, north of the equator, after sunset. The rocket mentioned above was fired during the daylight hours, 1400 hours EST, from Cape Kennedy, Florida. Rockets bound for outer space move in an easterly direction.

First report from "British Oak," Tenerife to Monrovia. Captain A. C. Browne. Observers, the Master and Mr. P. M. Edge, Chief Officer.

"27th November 1963. A point of light of about 2nd magnitude with an elliptical glow of approx. 3 degrees diameter and concentric circles of light was observed through binoculars at 1925 GMT. It was first seen bearing 230 degrees at 18 degrees altitude and disappeared 4 min. later bearing 190 degrees, altitude 8 degrees. The sky was

cloudless and the atmosphere clear."

"Position of ship: 24 degrees 27' N, 17 degrees 14' W."

A second report from "Ripon." Captain Smith. On passage to Freetown. Observers, the Master and Mr. G. W. Brown, Chief Officer.

"27th November 1963. At 1926 GMT an illuminated body was observed bearing 270 degrees, altitude 30 degrees. It appeared at first to have a suffused glow around it, but as the object moved parallel with the ship's course, the glow assumed the definite form of a tight spiral of blue-white light. The spiral expanded to a maximum radius of about 5 degrees with about 12 turns visible at one time when bearing 200 degrees, altitude 20 degrees. The size afterwards diminished until the body faded from sight bearing 155 degrees, altitude 12 degrees, at 1931. As the object moved in azimuth, it also appeared to be gyrating about a centre in an anticlockwise direction and to vary in brilliance. At its brightest the object had a brilliance less than Venus and greater than Altair; its track passed between these two bodies."

"The whole phenomenon gave the impression of looking into a conically formed spring and was indeed a most sensational sight. We can only conjecture that it was an artificial satellite 'gone wrong' or passing through a cloud of meteoric dust."

"The accompanying sketches show how the phenomenon appeared to the observers. There was a cloudless sky and bright moonlight at the time."

"Position of vessel: 10 degrees 5' N, 15 degrees 59' W."

A third report from "Pennyworth." Captain I. Gault. Middlesbrough to Monrovia. Observers, Mr. J. H. Edwards, 2nd Radio Officer, the Master, Mr. J. Nielsen, Chief Officer, Mr. J. MacKenzie, 3rd Officer, Mr. T. Walker, 1st Radio Officer, and the Chief Engineer.

"27th November 1963. At 1900 GMT for approx. 5 min. a bright object having a magnitude greater than any other star or planet was seen in the sky. It appeared to be stationary in the west at an elevation of 40 degrees, for about 2 min. It then moved off rapidly in a SE'ly direction, disappearing about 2 min. later. The bright light from the object radiated outwards, like the ripples from a pebble thrown into a pond; at first in concentric circles, then in a spiral and finally in concentric half-circles. The general impressions of the phenomena seen are shown in the accompanying sketches. The object was definitely not a meteorite, and the course was too erratic for an earth satellite."

"Position of ship: 7 degrees 39' N, 14 degrees 13' W."

The Marine Observer comments on these reports as follows:

"What was seen by the ships was undoubtedly an American rocket, 'Centaur 2,' launched from Cape Kennedy at 1900 GMT on 27th November 1963. The times and positions indicated by the three ships agree very closely with calculated values. The odd appearance cannot be explained precisely but it is no doubt associated with the fact that the rocket when seen was still under power or had very recently been so."

Recovering the Lost World, A Saturnian Cosmology -- Jno Cook

Chapter 17: The Gods Leave.

\$Revision: 42.27 \$ (leave.php)

Contents of this chapter: [\[The Gods Leave\]](#) [\[Return of the Axis Mundi\]](#) [\[A New Era\]](#)
[\[Endnotes\]](#)

The Gods Leave

The battling Gods in the sky started an immediate retreat after 3147 BC, and Saturn and Jupiter eventually moved to their current orbits, although it would take 860 years for Jupiter and may have taken over a thousand years for Saturn and the Titans. As the Gods retreated into the far sky, Jupiter at first continued to bolt objects in the asteroid belt, through which it was moving, as it was receding from the Sun. The displays enter the mythology of the Gods as the magical weapons of the chief God -- the bolt of Zeus that never misses, the hammer of Thor.

On reaching the asteroid belt Jupiter (in circa 2860 BC) would not likely have retained its extensive lower tail and would have reduced even its coma. Entry into the asteroid belt caused a religious crisis in Egypt. The first dynasty was replaced by the second. A large coma would only develop again as Jupiter exited the asteroid belt and was no longer in proximity to the conductive material of asteroids and dust. After about 300 years, Jupiter exited the asteroid belt in about 2550 BC at a distance from the Sun of 3.1 AU.

While Jupiter was in the asteroid belt, its massive mountain-shaped coma was replaced by horizontal streams of plasma from its south pole (as visually seen from Earth), directed left and right into the dust and objects of the asteroid belt. In Egypt Jupiter assumes the image of a God with ram's horns. After clearing the asteroid belt, Jupiter would again develop a mountainous lower plasma outpouring in an attempt to reach equilibrium with the electric field of the Sun in far outer space (between 3.5 and 5.2 AU from the Sun).

I will get back to this later period in a following chapter, but it might be of interest to quote Plutarch's brief description, from Zoroastrian sources, of the God Ahura-mazda (who is Jupiter). In *Isis and Osiris*, (AD 200) he writes:

"Then Oromazes [Ahura-mazda, Jupiter] enlarged himself to thrice his former size, and

removed himself as far distant from the Sun as the Sun is distant from the Earth, and adorned the heavens with stars."

"One star he set there before all others as a guardian and watchman, the Dog-star [Venus]."

The comment about "distance" suggests that eventually Jupiter's coma was the visual size of the Sun or Moon, subtending 1/2 degree in diameter. From this the coma can be estimated at 3.5 million miles (5,600,000 km) in diameter at the distance of 5.2 AU, which is only slightly larger than Jupiter's current dark mode plasmasphere. [\[note 1\]](#)

The "Dog-star" mentioned in the quoted text above is translated from Greek use of the Egyptian word "Sothis," which was used both for the star Sirius (the Dog Star) and the planet Venus, and meant something like "bright" or "shining." In Egyptian it takes the masculine form for Sirius and feminine for Venus, the difference being an ending "d" or "t" sound in our phonetic translation. The Greeks didn't differentiate, or didn't care. There is the additional confusion in the practice in antiquity of appointing stars as the "spirits" of the planets, as every person (in Egypt) would be stellated after death. Sirius was the brightest star and Venus was the brightest planet. Sirius was "the star of Venus."

The word "Dog-star" is used in the English translation of Plutarch, who used "Sothis" as a translation of "Tishtrya" from his source, the Zoroastrian *Zend-Avesta* scriptures. "Tishtrya" could also be translated as "shining." But from other evidence "Tishtrya" clearly is Venus.

As noted above by Plutarch, the planet Venus remained after the battle to course across the sky. In antiquity Venus is variously called Isis, Hathor, Athena, Inanna, and other names, and is often identified as a warrior Goddess. [\[note 2\]](#)

After 3147 BC, Venus circled the Sun as a planet, and for the next 2500 years displayed a gigantic plasma tail, stretching some 30 million miles (48 million km) away from the Sun. Because Venus is an inner planet, the full extent of its plasma tail would be seen from the vantage point of Earth most of the time. Today the tail has dropped to dark mode, but is still 30 million miles long. Today Venus also still shows its youth by its excessive heat radiating away, continuous lightning strikes, and curious sparsity of craters. [\[note 3\]](#)

Mythologically, Venus was presented alternately as a charmer and a terror. That she remained venerated, despite occasional destructive electric contacts with Earth, is probably due to the fact that Venus was the most spectacular object in the sky between 3100 BC and 685 BC, an image intermittently reinforced by being seen at various distances and various parts of the sky and drawing closer every two years or so. She must have been seen as everyone's friend and companion throughout life. Like the Moon today, wherever one walked, Venus would follow. In Babylonian (Chaldean) records Venus is not recognized as a "planet" until after 600 BC, as also in Hindu records. She simply did not behave as a planet.

And a minor planet, Mercury, with wings and a tail (or a beak, in some Egyptian iconography) continues to scurry back and forth as a messenger of the removed Gods. The orbit of Mercury is the most displaced in angle from the ecliptic, and would have been understood as flying off the ecliptic (the path of the Gods) at times, often disappearing in the portion of the sky where the Sun rose. Mercury became the God of the air in Mesopotamia.

Mercury started to appear with Mars close to Earth about 80 years after 3147 BC. Mars will become the most important God, Horus of the Egyptians, over the next 300 years, a position already held since 4077 BC, but under a different form. More on that in the next chapter.

The Titans (the two giant planets Uranus and Neptune) were banished to the Underworld -- the far reaches of the Solar System -- to be rediscovered by telescope nearly 5000 years later, and named in accord with Greek mythology. Saturn takes up his station as Lord of the Underworld. He eventually becomes just a faint speck among the stars of the sky. However, he will be recognized and kept track of worldwide.

If, as a reader, you wonder at the movement of these planets seemingly out of concert with the celestial harmony of today, I should first remind you that after this period any of the suggested orbits are (with some exceptions) only slightly different from today. I can, in fact, trace almost all of the changes. Most of this will become clear in later chapters and in the appendixes.

But on the other hand, the Solar System is hardly as stable as is generally accepted. The orbits of some of the outer planets are today observed to be changing inclination to the ecliptic, although minutely, caused by gravitational interactions with each other, but as likely to be the result of electric interactions with the Sun. All the repeating comets have likewise been observed to change orbits for reasons which cannot be attributed to gravitational forces alone. [\[note 4\]](#)

The Return of the Axis Mundi

As the Earth assumed a new orbit around the Sun after 3147 BC, it would have had to equalize its charge to match its location within the electric field of the Sun. This was a change from the electric field experienced when Earth was yet within the plasmasphere of Saturn. The equalization of charge would have been accomplished through an influx of electrons, concentrated at the magnetic poles.

[Image: Plasma plumes at the poles extending into the magnetosphere in the direction away from the Sun. Illustration by J. Cook.]

Plumes of plasma in glow mode would have extended soon after 3147 BC from both poles, rising straight up from the north and the south, and then bending toward the tail end of the magnetosphere, away from the Sun, looking like bent trees at the top. These would be seen at night throughout the world. Most likely the stems of the plumes looked to be the same size or only diminished slightly in diameter with distance from Earth. At the upper end the plume would be terminated in a single plasmoid sphere (similar to the Peratt Column seen in the south after 10,900 BC), with the typical tentacle-like structure extending away from the plasmoid. We know this from Mesoamerican descriptions (as the birds on top of each "directional tree") and later Akkadian and Egyptian illustrations. It is also likely that the *axis mundi* widened at the base to a bulbous form from the formation of a dome of water vapor where the plasma column contacted the ocean and where the plasma plumes turned to arc mode.

To be seen to a latitude of 20 degrees, as in Mesoamerica, the plumes would have had to

extend 4 or 5 Earth diameters up (30,000 to 40,000 miles; 48,000 to 64,000 km) along the magnetic field lines, and another 4 or 5 diameters into the tail of the Earth's plasmasphere where they terminated in a ball-shaped or flower-shaped plasmoid. If understood as trees, the plumes would seem to wave in the wind, although in actuality this is the nightly change in perspective resulting from the rotation of the Earth, for the tops would continue to follow the direction of the magnetic field lines of the plasmasphere extending away from the direction of the Sun. The north and south trees would bend toward the east at the start of the night, and rotate to end up bending toward the west by dawn. [\[note 5\]](#)

It might be suggested that after the passage of time the ball plasmoid at the end of the tree would no longer show. It could also be suggested that the plasma plume showed only periodically, perhaps annually as the Earth, still on an elliptical orbit, moved alternately into a region of higher or lower value of the Sun's electric field. That would mean, since we are dealing with plasma, that the plume would show suddenly and would disappear again as suddenly at the end of some months as the Earth returned on its orbit to a lower value of the electric field and the plasma might switch to dark mode.

The repeated appearance of the plasma plume might suggest that it is represented by the repeating "shepherd's crooks" carved on megalithic surfaces by the people at Carnac in France (and other locations). A count of the crooks could furnish some estimates of how many years the *axis mundi* kept returning, although a baseline measure is missing if we assume that the region was completely depopulated after 3147 BC.

It could also be suggested that the "year glyph" used in the oldest records of Egypt, the Palermo Stone, represents the annual appearance of the plasma plume. The Palermo Stone is a carved basalt block from the Fifth Dynasty (circa 2550 BC) of the Old Kingdom, of which only seven fragments exist. The Palermo Stone records pharaohs of the first five dynasties. For each of the pharaohs there is a catalog of years, with each year named after an important event. Each year is distinguished from the next with a "year glyph," which arches over the space used to record events. The glyph is thought to be based on a bent leafless palm frond, as if one portion of the leaf was removed every day from the frond. [\[note 6\]](#)

Mesoamerica recognized a total of four trees which held up the sky, perhaps also the daytime sky, but certainly the nighttime sky. Mesoamerica places a bird on top of each of the trees. This is obviously an understanding of the terminating plasmoid of each plume, with the tentacles constituting the tail of a bird. The four trees or pillars also occur in the mythology of the Egyptians and the Chinese. From Egypt we have the following:

"This heaven was situated in the sky, which the Egyptians believed to be like an iron ceiling, either flat or vaulted, and to correspond in extent and shape with the earth beneath it. This ceiling was rectangular, and was supported at each corner by a pillar.... At a very early date the four pillars were identified with 'the four ancient khu's who dwell in the hair of Horus,' who are also said to be 'the four gods who stand by the pillar-sceptres of heaven.' These four gods are 'children of Horus,' and their names are

Amset, Hapi, Tuamautef, and Qebhsennuf. They were supposed to preside over the four quarters of the world, and subsequently were acknowledged to be the gods of the cardinal points."

-- E. A. Budge in *The Book of the Dead* (1895)

Budge further explicates that the four pillars holding up the sky, are also called the "*four blazing flames made for the Khu.*"

Book 13 of the *Chilam Balam*, titled "The Creation of the Uinal" by the translator Roys, reports on how the Uinal, the 20-day month, "came to be created before the creation of the world." The remainder of Book 13 is composed as a song, attributing some quality to each of the 20 day names of the 13 numbered days of the month. At one point we have, "Then the following were set up in the middle of the land: the Burners, four of them." The "Burners" are named after the 5th, 10th, 15th, and 20th day of the month, then noted that "these are the four rulers."

There is little question that these four Burners are the four Bacabs, the Maya gods of the cardinal points, here represented, like in Egypt, as braziers. It is certainly a strange coincidence which cannot be neglected. We have to conclude that the two plasma plumes at the magnetic poles turned to arc mode near the Earth's surface or well above it. Something similar must hold for the east and west plumes, although it is difficult to make physical sense of this.

Four trees of the cardinal directions appear throughout Book 10 of the *Chilam Balam*. Two of the trees of Mesoamerica are associated with the east and the west, which I cannot place with certainty, as I noted above. At first I thought they might be the leading edges of the Absu, lit by the Sun, and seen rising up and widening directly from the east cardinal point and from the west. But after the Absu had disappeared, the four trees are sighted again two additional times, according to the *Chilam Balam*.

The plumes show up repeatedly in diverse cultures. I will suggest that the east and west plumes might be an image of the denser portion of a toroid of plasma encircling the Earth (the nearer Van Allen belt). It would thus appear at the location of the equatorial, overlapping it and rising at an angle. The edges of this tube would stand out, for the plasma would be denser along the left and right edge. In some Mesopotamian illustrations a circular form is shown above the stalk. This might be a portion of the circular toroid which composes the Van Allen belts. In this case there would not be the triple leaves (the birds) associated with the ball plasmoids of the north and south polar plumes. This might be a graphical shorthand, however, for in some Mesopotamian seals the tops of the plumes are shown as small lions.

Both China and Mesoamerica assign colors to the four trees, and as a result to the four cardinal points. The colors assigned in Mesoamerica (Maya) can be traced to the looks of the sky in these four directions. The tree at the north is white, as would be appropriate to a

northern glow mode plasma plume seen from the northern hemisphere. The tree of the south is yellow, which is likely the coloration due to looking south through the color of the Absu, before it disappeared. Initially after 3147 BC, the east tree is listed as being yellow, although the translator of the *Chilam Balam* thinks this is an error. But the Absu most likely was colored yellow, buff, or amber. But in 2349 BC and 1492 BC the tree in the east is listed as being red. This is the time when only a single red ring of the Absu still remained. The tree in the west was always black. So reads the *Maya Book of the Chilam Balam*.

The colors of the east and west trees were most likely determined as the night passed and dawn came (Mesoamerica defined events at their completion). At dawn the east tree would reflect the light of the rising Sun. The west tree was in the shadow of the Earth at dawn, so it was always black.

The north tree would be the largest since the north magnetic pole is the most effective in gathering electrons. The first formation of this tree, soon after 3147 BC, was a monumental event, recorded in specifics not only in the *Chilam Balam* but also in casual reference in the *Popol Vuh* narrative. Additionally, the establishment of the tree in the north was monumentalized in AD 700 in the sculptured texts of the Temple Inscriptions at Palenque. The central temple relates in part:

[with text added by archaeologists] or {me:}
"[On August 13, 3114 BC,]
13 Baktuns were completed.
1 year, 9 months, and 2 days after the new epoch began,
G1-prime {Saturn} entered the sky.
On February 5, 3112 BC, G1-prime dedicated it.
Wacan chan xaman waxac na G1 {Venus}
{raised-up-sky north-eight-house G1}
was its name.
It was his house of the north."

The use of "G1," Venus, rather than "G1-prime," Saturn, may be an error in Schele and Freidel's book *A Forest of Kings*, from which I quote this inscription. However, this matches the tale from Egypt about the travel of Isis to the tree of the north, at Biblos, which included the coffin of Osiris (under which there was a fire, as would be appropriate for a plasma plume).

For the present purpose it should be noted that the raised-up-sky north-eight-house (or "edifice") was dedicated a year and a half after the start of the current era, as retrocalculated by the Maya. It is within expectations that it would take perhaps a year to develop a plasma stream in glow mode in response to a change in the electric field surrounding the Earth's plasmasphere, although it seems late. (The plasma starts in dark mode and then suddenly switches to glow mode.)

The plume is noted here (and in other records) because the raised-up-sky north-eight-house was without a doubt larger than anything else ever seen in the skies up to this point in time. It rose far above the previous polar location of Saturn. Seen from Mesoamerica, the Saturnian planets had hovered only some 20 degrees above the north horizon. "Saturn entered the sky," is noted because the planet had now moved (within a year and 9 months) across the sky and to the south. This had to be established first (in this text) because otherwise Saturn (G1-prime) would perhaps not have been able to construct his edifice. Mesoamerican languages are action based.

I think, from the constant use of names-with-numbers in the *Chilam Balam*, that north-eight-house signifies an eventual total of eight appearances of the plasma plume. There is one Maya record (a ballcourt marker at Copan) which claims nine appearances in the north. The *axis mundi* would certainly be well remembered if, as I would suggest, it was last seen again in 686 or 685 BC. [\[note 7\]](#)

If, as I have claimed, the plasma plume would impinge on the Earth at the magnetic poles, then certainly there should be some record of this for the north magnetic pole -- if the magnetic pole were located in the North Atlantic. As a matter of fact, there are historical assertions as late as AD 800, although somewhat fanciful, claiming a descent into the whirlpool created by the concentrated plasma stream. There are stories also told as late as the 19th century (Edgar Allen Poe, "A Descent into the Maelstrom" 1841).

There are additional Celtic, Icelandic, and Norse "myths" which claim the whirlpool emitted a thunderous noise and flames. Some of the recollections might incorporate details from much longer ago than the 7th century BC. As with plasma streams today impinging on the atmospheres of Jupiter and Saturn, the incoming plasma bored a hole into the ocean. The rotational magnetic field surrounding the incoming electric current would set the water and steam into a spin. The concentration of plasma at the point of contact would change the plasma stream to arc mode. The boiling of the ocean water would produce the grinding noise. Among Northwestern European nations (Friesland, Denmark, England, and Norway) the whirlpool is known as the Maelstrom (or Maal Stroom), which translates as "grinding stream." Maps of the North Atlantic place the Maelstrom off the coast of Norway. [\[note 8\]](#)

The trees would fade with time, then suddenly disappear. As a result the trees will reappear again, as the *Chilam Balam* makes clear, with each major change in the Earth's orbit -- as, for example, in 2349 BC and 1492 BC. I will address these changes in following chapters.

... the celestial cow

I should also note that if the left and right extremes of the surrounding Van Allen belt toroid could be seen as trees, or some such structure standing at the east and west cardinal point, then the remainder of the Van Allen belt -- the portion overhead and bridging the equatorial -- would also have been seen when it achieved glow mode.

[Image: Inner and outer Van Allen belts located within the magnetosphere of Earth.]

The inner Van Allen toroidal belt, located above the Earth's equator, varies in size, extending from as little as 0.1 Earth radius (400 miles; 650 km) to 3 Earth radii (12,000 miles; 19,000 km). The larger outer Van Allen belt reaches from 3 to 10 Earth radii. My estimate is that the Absu reached somewhat more than two Earth radii (8500 miles) above the equator.

The glowing inner Van Allen belt likely constitutes the "body" for the cow of Hathor, with the east and west plumes adding the legs. The view of the Van Allen toroid would have been smaller (further away) in the east and west, and obscured by the atmosphere, so that only the dense edges showed -- two in the east and two in the west.

The shadow of the Earth would have cut a dark oval into the bottom of the body, the underbelly of the cow, although the Van Allen belts are not, like the Absu, a narrow phenomenon which appears only in the plane of the equatorial. The Van Allen belts are much wider, and would have been seen thousands of miles away from (north and south of) the location of the equatorial. But if the inner belt lowered to 400 miles (650 km) (as it apparently does under conditions of high solar wind activity), a portion would certainly have been removed by the Earth's shadow.

What is missing from this image are the head and udders of the cow. The cow was a familiar farm animal to the Egyptians, and clearly distinct from a bull. It was the "bull of heaven" which had, only months earlier in 3147 BC, come through and destroyed the home of the Gods. There were no celestial cows among the Maya or Olmecs. There are no cattle in Mesoamerica. There is mention of cows in the Icelandic *Younger Edda* of AD 1200, but it is conflated with events of a much earlier era.

The cow would have been a form seen more or less in the center of the sky, on both sides

(north and south) of the equatorial, and stretching from the east horizon to the west. The cow might have been a calf, as the Israelis under Moses claim as a sacred image. The cow or calf returned as an apparition a number of times throughout history (in fact, apparently seven times).

The Van Allen belts increase in size (mostly their thickness) with increased activity by the Sun. Today, after becoming very active, the Van Allen belts discharge to the space away from the Sun in a matter of days. This would suggest that the "cow" of antiquity also did not last all that long after appearing.

For the Van Allen Belts to show in glow mode there would have to be an influx of electrons and protons from an exterior source (electrons collect in the outer belt, mostly protons in the inner belt). Thus I would expect the "cow" to only show up (for example) at those times when Venus aligned between the Sun and Earth, and the electric condition of the Earth and its surroundings changed. The cow would show directly after the cataclysm had passed.

I'm suggesting Venus as a cause here because in Egyptian sources the cow shows up seven times. In Egypt it is the cow-eared Goddess Hathor who is identified with Venus at the times of an electric contact with Earth. She is frequently depicted as a cow and is also known as one of the "Seven Hathors" (see, for example, sculptures of the Seven Hathors at the Temple of Hathor at Denderah). In the Maya *Chilam Balam* Venus is called "Ah Uuc Chekna," which translates "who fertilizes the maize seven times." The seven dates would have included the four times between (and including) 2349 BC (the "flood of Noah") and 2193 BC (the fall of Akkad), plus two dates associated with the Exodus, 1492 BC and 1442 BC.

The seventh might be the 776 BC Venus contact with Mars, or following the 685 BC nova event of the Sun. The date of 3147 BC is not associated with an electric contact by Venus. I'll detail all of these in later chapters. [\[note 9\]](#)

... the green tree

There was also a "green tree of the center" defined in the *Chilam Balam* directly after 3147 BC but not at other times. The location is apparently the whole range of the southern sky, from the east to the west. This is Jupiter on his green mountain receding into the distance of the southern sky. Jupiter would appear first in the east or southeast and look small. The green shape would increase in size as the Earth overtook Jupiter, and diminish again in size as Earth passed Jupiter. The green mountain would thus seem to move across the whole of the sky in a period of months (and also on a daily basis with the rotation of the Earth). This movement through the south skies would allow the judgment that the green tree was located somewhere in front of the trees of the east, the west, and in front of the yellow tree of the south, and could be called the "green tree of the center."

In about 2900 BC Jupiter entered the asteroid belt, and the green mountain disappeared as the

plasma outpouring changed shape. The green tree is not heard of again. In the Guatemalan *Popol Vuh* this apparition is a traveling mountain, named Zipacna, which (since we are dealing with a tropical environment) can be assumed to be green. The mummified Osiris of the Egyptians is always shown in Green. [\[note 10\]](#)

A New Era

Humans who had observed the celestial drama narratized the events with some difficulty and with considerable confusion, which shows in the later accounts which have come down to us. Both in Egypt and Mesopotamia, the stories of the first period after the breakup of the Saturnian system involved repeated councils by the Gods where agreements were reached and then broken and tradeoffs were made. It seems to have taken many years before matters in the sky were settled.

As mentioned earlier, late Egyptian legends speak of battles and periods of negotiations (lasting over 80 years) among the Gods as they determine who, between Seth and Osiris, is to rule which territory -- Upper Earth (Heaven) or Lower Earth (the Underworld of the south skies). But the story is eventually cast in terms of a division between Upper and Lower Egypt, rather than Upper and Lower Earth. As the planets Jupiter (Seth, Osiris, and later Re) and Saturn move further away from Earth, and as Horus (Mars) starts to show up near Earth, the claims on territories change. Horus ends up as ruler over all of Egypt, both Upper Egypt and Lower Egypt, Osiris receives the Underworld of the dead in deep space, and Seth gets nothing. It is also not clear who Seth is.

The actual power of various cult centers over national politics varied over time. The worship of Horus is from Heirakonpolis (Nekhen), 400 miles (650 km) up the Nile river. Heirakonpolis probably initially gained control over all of Egypt with the establishment of the city of Memphis at the apex of the delta, thereby controlling trade up river, but did not retain power, which later passed to cult centers in the delta. Horus was also worshiped in the delta. Seth was worshiped in the region just south of the delta. In the delta Ra or Re was also worshiped, but his worship did not take hold with the pharaohs until the 4th dynasty. Ra, at that point in time, was Jupiter.

The tale about the negotiations, the *Contending of Horus and Seth*, is considered to be a 12th dynasty (circa 1500 BC) version of a much older myth. The actual descriptions of the contests and labors with which Horus and Seth are beset are ridiculous in the extreme. Isis is involved also, at times as the goddess Hathor. The following is a short narrative version adopted from [\[www.philae.nu/philae/Horus&Seth.html\]](http://www.philae.nu/philae/Horus&Seth.html):

"After another appearance before the court of the Gods follows a series of bizarre events. First, Horus and Seth change into hippopotami and stay under water for three months. [This was a contest of sorts.] Isis becomes concerned for her son and throws a copper harpoon, but it misses Seth and hits Horus instead. She retrieves it by magic on

his complaint. On her next throw she hits Seth but he appeals to the brother-sister relationship between them, and she withdraws the weapon. Horus emerges out of the water, enraged that his mother spared the life of Seth. He cuts off her head and she turns to flint."

"Under water" is under the edge of the Duat. The ecliptic, low in the south sky in summer nights, would dip below the Duat perhaps a month after the vernal equinox and rise out again a month or so before the autumnal equinox. That accounts for three months under water.

We can also suggest that the "copper harpoons" represented plasmoids launched at Mars (Horus) and the other planet, Seth (whoever he is), in sequence. They would be copper colored, rather than the bright white of an electric arc, because they are seen through the screen of the Duat, which was most likely yellow, buff, or copper colored.

That Isis (Venus) would lose her head likely represents the sudden switch of the coma of Venus to dark mode (or a notable reduction in size) after releasing two massive lightning bolts. It might be the loss of her tail rather than her coma. The Egyptians would have seen the bolts travel along the ecliptic, like thrown harpoons, and explosively "detonate" at the two planets. We would expect plasmoids to be brilliantly white, for they are electrons in arc mode, but seen behind the Absu or Duat, which was colored buff or yellow, these would have changed to a coppery color.

If the *Contending of Horus and Seth* was created out of nothing as a narrative in circa 1500 BC, then we have to ask how these people knew about the change in color -- the screening of the Duat which had not been seen since 2349 BC. All but a single ring of the Duat had disappeared 850 years earlier.

That brings up the question of what planet here represents Seth. For the period directly after 3147 BC, when Jupiter is seen receding into the southern night sky after attacking Saturn, I would suggest that Jupiter is Seth and Saturn is Osiris. But somewhat later (differing by the "theology" of differing Egyptian nomes), it is Jupiter who is Osiris -- a mummified form depicted in green, and matching the description of the Quiche *Popol Vuh* as a traveling green mountain. At that time, or at some point in time, it is also likely that Mercury was identified as Seth, still on a very elongated orbit and always seeming to travel nearly the same orbit as Mars. If Mars and Mercury traveled together, this would allow Venus to harpoon both of them within a short interval. Mercury also sported a large coma, polar plumes, and a tail. In fact, a globe will grow out of Seth's head in a later episode of this narrative, which in effect is Mercury developing an enlarged coma.

These details place the origin of the story in the era shortly after 3147 BC, but mixed in are much later elements. For one, Seth in the end is assigned to travel in the bow of the boat of Ra (Jupiter) to watch for the celestial snake Apep (details of Apep are in a later chapter). The "boat" form of Ra is the "shen" form associated with Jupiter after about 2940 BC but the snake Apep does not show up until after 2349 BC.

A few more discordant story elements are added, like the gouged eyes of Horus, and a whole "semen" episode.

"Later Seth finds Horus asleep under a tree and gouges out his eyes which he buries in the sand where they turn into lotus flowers. Hathor finds Horus and pours gazelle milk into his eye sockets, causing them to heal."

"Seth next invites Horus to his home, and makes a homosexual attack on Horus. Horus however catches the semen of Seth in his hand which he shows his mother Isis. She in outrage cuts off his hand, throws it into the marshes. Then she makes Horus's phallus rise and catches his semen in a jar, spreading it on lettuces which Seth will eat. Before the council of the Gods Seth claims the homosexual domination of Horus, but Horus instead wants their respective semen to speak from where it is located. Thoth [who also plays Seth] calls the semen, and the semen of Seth comes out, not from Horus, but from the marshes where his hand had been thrown by Isis. Horus's semen appears as a gold disc on the head of Seth who now is humiliated."

The "eyes of Horus" will be recognized as the ball plasmoids at the end of polar plasma plumes, which must have been bright enough to light up the night. Horus was located in the ecliptic next to (sleeping under, that is, in retrograde motion) the southern plasma plume. This suggests that the initial plasma plumes after 3147 BC may have lasted for a half-century. "In the sand" is the last ring of the Duat, equated by the storytellers to the strand of the Duat ocean.

The totality of semen exchanges should be recognized as plasma in glow mode between planets and, in the case of the "swamp," with objects in the asteroid belt. The lettuce is an Egyptian variety which exudes a milky-white liquid when broken open. The court proceedings are eventually resolved as follows:

"The council now sends a letter to Osiris in the underworld, asking for advice. Osiris threatens them all if his son is not chosen. He will remove the stars in the heavens together with man and god alike and make them all descend below the Western Horizon. This causes the council to finally instate Horus on the throne of Egypt. Re states that Seth will accompany Re in the heavens and that his voice will be heard in the thunder itself."

Osiris (here possibly Jupiter) is obviously far removed, placing this ending well after 3147 BC, when Jupiter had entered the asteroid belt. The worship of Jupiter as Osiris dates from the end of the Old Kingdom, 2349 BC, when the first references to Osiris show up, and, as will be detailed in later chapters, Jupiter suddenly reappeared in his full mountain form after exiting from the asteroid belt.

In the end, in the *Contending of Horus and Seth* it is agreed that Osiris (now as Saturn) gets the Underworld and remains there, swaddled in strips of cloth like a mummy. He never again

disturbs other planets. Jupiter remained active only a short time, then, about 200 years after Mars shows up, entered the asteroid belt, reduced the size of its coma, and started zapping asteroids which came near.

Egypt is awarded to Horus, who is held to be the resurrected Osiris, but in actuality is Mars now on an orbit which periodically overrides the orbit of Earth. This condition apparently started 80 years after 3147 BC and lasted some 300 years. Mars appears as an active and impressive ruler of Earth. By comparison, Jupiter does nothing except recede further from Earth. [\[note 11\]](#)

Within a hundred years of the initial disturbance of 3147 BC, both Mesopotamia and Egypt rebound to achieve the most stupendous growth in civilization ever seen. (Both also initiate the first dynasties.) This rebound stands as one of the most amazing facts of prehistory, a blooming of civilization often noted as "unsurpassed" by historians and archaeologists. This is duplicated in other places, as if the world suddenly woke up. Large-scale grain cultivation starts up right after 3000 BC (but due to other considerations) in West Africa, the Indus valley (Pakistan), China, Southeast Asia, Mesoamerica, and South America. Agricultural production in Mesopotamia increases as never before, monumental stone architecture soon takes a leap forward in Egypt, trade is expanded, and writing suddenly proliferates. [\[note 12\]](#)

In spite of this progress, however, both Mesopotamia and Egypt remain conservative and rooted in the past. The temple religions and economies are now more tightly integrated into society than ever and become the justification for the kings and pharaohs who rise to fill the void left by the departed Gods.

The universal lack of an elite before 3100 BC is an outstanding and inexplicable difference between the culture before and after the flood of 3147 BC. Today we simply cannot imagine the existence of large egalitarian societies which somehow accomplished the extensive irrigation projects, food production, and trade which existed before 3100 BC. We are much more comfortable with conditions after 3100 BC, when kings, pharaohs, and emperors show up to lead the people.

We are a gregarious species and although we do not seek out leadership, after the removal of the powerful Gods, anyone who reached out to lead the people, would have been willingly accepted. Perhaps it was cast as a benign care-taking initially. The first kings in Sumer are known as the "shepherds of the people." The new leaders everywhere take on the role of the Gods. [\[note 13\]](#)

Again, I have to point to the sky for the example of the behavior of those who assume the leadership as kings and pharaohs. The new leaders all derive from the established priesthood, and are often the primary servants of the local God. The new leadership understands dynastic succession as legitimate. It had been seen among the Gods. The new leadership sees battle and the death of others as a means of achieving power. This too could be inferred from the activities depicted in the skies. In Mesopotamia the new leaders remain as the kings of

distinct theocracies. In Egypt the new leadership unifies the individual districts, with their individual Gods, and assumes for itself the identity of the one ruling God, Horus.

Special thanks to G Gilligan for pointing out the seven celestial cows of Hathor.

Endnotes

Note 1 --

To have the same apparent diameter (a half degree) as the Moon at the eventual location of 5.2 AU from the Sun, 480 million miles (773 million km) from Earth (using the tangent of 1/2 degree, with the Earth located at this time at 0.79 AU), the coma would have been:

$(\sin(0.5) / \cos(0.5)) * (5.2 - 0.79) * 93,000,000 = 3,500,000$ (5,600,000 km) miles in diameter.

Plutarch's information can be verified, at least to within an order of magnitude. Near the closest region of the asteroid belt, 215 million miles from Earth (at 3.1 AU, with the Earth located at 0.79 AU at that time), the coma of Jupiter before entering the asteroid belt would have looked about two times as big, thus twice the size of the Moon. Plutarch had suggested "thrice." Within the asteroid belt the coma would have reduced in size because of the surplus of conducting agents.

Considering that the comas of comets a few miles wide at times exceed the diameter of the Sun, 864,000 miles (1,390,000 km), these estimates do not seem unrealistic for Jupiter, which has a diameter of 88,700 miles (143,000 km), and today has a plasmasphere (in dark mode) which is 3.2 million miles (5 million km) in diameter.

Note 2 --

In Egypt, as Isis, she is understood to have traveled up and down the celestial Nile (the ecliptic) in search for Osiris's body parts after 3147 BC. The Egyptians initially identified Venus as Neith, another warrior Goddess, and only later applied the names Isis and Hathor. The plurality of names probably stems from the religious democracy of Egypt, and would thus be names specifically in use at the temples of differing nomes. As I pointed out earlier, Neith originally was the ball plasmoid of the south skies, last seen in about 8347 BC.

The Sumerian and Akkadian Goddess Inanna is Venus, and narratives from 2300 to 2000 BC have her on repeated adventures, including visits to Lower Earth, that is, the Underworld (as in *Inanna's Descent to the Netherworld*). At each of seven gates of the underworld she is

stripped of some item of clothing, and eventually she is hung from a hook. The seven gates are the rings of the Absu, used narratively.

The implication is that the orbit of Venus extended beyond the orbit of Earth, and at least periodically Venus was seen as an outer planet and visually slowed to a stop, in what is known as "retrograde motion." If at that moment Venus still had a visible tail, it would stretch away from the Sun as well as Earth, and thus would not be seen. I will suggest in later chapters that the orbit of Venus did indeed overrun the orbit of Earth in antiquity, at least until 1492 BC.

[\[return to text\]](#)

Note 3 --

Robert Fritzius points out the lack of small craters, and the relatively few large craters, in an essay, "Is Venus a New Planet?" presented at the American Astronomy Society in 2007. See [\[www.shadetreephysics.com/vel/NewVenus.htm\]](http://www.shadetreephysics.com/vel/NewVenus.htm).

Because craters are the anode burn marks of plasma in arc mode, small craters would not be expected on any planet with an extensive atmosphere, since the plasma strikes would be dissipated by the atmosphere. The same is true for Earth and for Saturn's satellite Titan. And yet, there are also far too few large craters.

[\[return to text\]](#)

Note 4 --

Robert W. Bass in 1974 pointed out that the original estimates of planetary orbital stability were made by Laplace in 1773, and have been quoted without question for 200 years. Bass writes:

"Laplace's theorem allegedly proving stability of the solar system (1773) was shown to be fallacious in 1899 by Poincaré; in 1953 dynamical astronomer W. M. Smart proved that the maximum interval of reliability of the perturbation equations of Laplace and Lagrange was not $10 \exp 11$ years, as stated in 1895 by S. Newcomb, but actually at most a small multiple of $10 \exp 2$ years."

-- Robert W. Bass "Can Worlds Collide?" *Pensee* (1974)

A few hundred years ("a small multiple of $10 \exp 2$ ") is vastly different from 100 billion years (" $10 \exp 11$ "). As suggested from the little data available from antiquity, it might be much less than that. The Earth / Moon system apparently became stable within a period of about 30 years.

Note 5 --

Milton Zysman first proposed something like this, in 1994 at a Velikovsky Symposium, for the era after 1500 BC when the Israelites followed a pillar night and day after the Exodus from Egypt. Zysman assumed this would be an extensive aurora. But auroras depend on gases in the Earth's atmosphere and upper atmosphere to achieve their colorful effects. The effect comes about through high-energy electrons in cyclotron motion colliding with low-pressure Oxygen, Hydrogen, and Nitrogen atoms. The aurora only extends about 60 miles (100 km) up from the surface of the Earth. A very intense aurora will extend up to 600 miles (1000 km) in altitude in a red glow from sparse Oxygen ions above the atmosphere. But even 600 miles is not enough to be seen worldwide, although intense auroras tend to be placed at lower latitudes. Above the 600-mile altitude the effect of the incoming electrons would be invisible, unless, as a plasma, it switches to glow mode.

[\[return to text\]](#)

Note 6 --

The year glyph occurs already in predynastic times circa 3100 BC to 3050 BC, but, as far as I know, not before 3147 BC.

In Roman Republican times, staffs (Latin *Lituus*) shaped like the polar plumes were carried by the Roman college of augers to "mark out a ritual space in the sky" in order to "indicate divine favor or disfavor" by the passage of birds (Wiki). This is of course the same instrument associated with the pharaohs of Egypt, where it is called a shepherd's crook by archaeologists. In actuality it represents the Pharaoh's control over time.

Today Roman Catholic bishops still carry staffs of the same shape ("crosiers") as a symbol understood to represent a shepherd's crook and thus suggesting their role as shepherds of the community. I might point out that the bishop's mitre also dates from late antiquity (although this is much disputed).

Note 7 --

Ballcourt A-IIb at Copan in Honduras was built during the sixth or seventh century AD, and soon remodeled. The remodeling preserved three central alley markers, representing the mythological burial places of the father and uncle of Hunahpu and Xbalanque, the heroes of the *Popol Vuh*. Similar markers are found at Yaxchilan, Cerros, and other locations. But at Copan the carvings are well preserved, and can be read. Two mythological characters are shown flanking a ball in each marker. Only the ball of the central marker is in play (between Hunahpu and One-Death); the balls of the north and south markers are suspended by a twisted cord from overhead beams.

A tree is shown on the outside area of the north and south markers. The tree of the north is labeled "Nine Successions"; the tree of the south is labeled "Seven Successions." If, as I suspect, the trees represent the polar plasma plumes of the north and south, then we have here

an inventory of how many times the *axis mundi* reappeared. It would be appropriate to reappear more frequently in the north, since the north magnetic pole would facilitate a larger influx of electrons.

[Image: The ballcourt markers from Copan,
circa AD 700; after Freidel and Schele.]

I can only list seven events where this might have happened -- 3147 BC, 2349 BC, 2193 BC, 1492 BC, 1440 BC, 747 BC, 686 BC -- each corresponding to a known change in the Earth's plasma condition. The dates of 1440 BC and 686 BC are not certain. The date of 685 BC could be added. I also have the suspicion that there might have been two additional changes in the orbit of Earth between 2349 BC and 2193 BC, which have remained unrecorded. All of this information will be developed in following chapters.

The name "Nine Successions" is one more "succession" than noted in the records at Palenque, where the first northern plasma plume is called "north-eight-house."

[\[return to text\]](#)

Note 8 --

With reference to the Maelstrom, Giorgio de Santillana and H. von Dechend, in *Hamlet's Mill* (1969), reproduce, without comment, two early maps, the 16th century *Carta Marina* (Olaus Magnus) and an illustration from Athanasius Kircher's *Mundus Subterraneus* (AD 1665). The first map places the Maelstrom off the southwest coast of Norway; the second map places it further north. Both locations are relatively close to land. In the 16th century the north magnetic pole was located south of Spitsbergen and west of Norway.

[Image: Carta Marina map. After Giorgio de Santillana and H. von Dechend, "Hamlet's Mill" (1969).]

[Image: Mundus Subterraneus map. After Giorgio de Santillana and H. von Dechend, "Hamlet's Mill" (1969).]

Santillana and von Dechend offer other worldwide mythological references, but most are descriptions seen from afar, and likely to represent events before or directly after 3147 BC. They vaguely note that the whirlpool is mostly located in a northwest direction from Greece (or north by northwest from Western Europe). In the end, with no physical model available to them, Santillana and von Dechend suggest that the whirlpool is a representation of the precession of the ecliptic, although they admit that this model "does not, of course, help to understand any single detail."

[\[return to text\]](#)

Note 9 --

The series of 7 dates which I have suggested may need to be altered, so that 747 BC (a Mars event) is added. The strong association with Venus (Hathor) in Egypt is probably because of four repeated electric contacts with Venus starting in 2349 BC. The sequence of events for 2349 BC is detailed in the New Kingdom *Tale of the Celestial Cow*, (recorded in some five tombs) which recapitulates the contact of 2349 BC and was the start of three additional contacts which ended the Middle Kingdom of Egypt in 2193 BC. More on this in chapter 19 and following.

[\[return to text\]](#)

Note 10 --

When Marinus van der Sluijs put out the book *The Mythology of the World Axis* (2007), I started to investigate if plasma plumes might have been sighted repeatedly in antiquity. Even Nonos in circa AD 450, in his poem *Dionysiaca*, recounting the events of 685 BC, makes casual reference to a world axis, the *axis mundi*, writing, "Even the axis, which turns in the centre, began to totter through the whirling ether."

[Image: THEMIS mission tracks electric tornadoes in space; Shown on the night side of Earth; after Andreas Keiling, UC Berkeley.]

It was the information from Mesoamerica (noted in the text) which convinced me that this was so. One soon realizes that the plasma phenomena could also be described by the directional trees mentioned repeatedly in the Maya *Chilam Balam*. In March of 2008 I added sections titled "Return of the Axis Mundi" to various chapters. Then a year later vd Sluijs wrote a piece for the Thunderbolts.info website (March 29, 2009), presenting information from a press release from UC Berkeley, which stated that NASA had discovered the (northern) plasma plumes, on the night side of Earth, bending up into the magnetosphere, and extending 40,000 miles (65,000 km) up -- as I had predicted about a year earlier. I did not initially propose two plasma plumes. Vd Sluijs writes:

"The idea of a giant radiant pillar rising up from the earth to the sky would have sounded too fantastic to be true - until recently."

"In April of 2009, NASA's fleet of THEMIS satellites detected vast electrical tornadoes about 40,000 miles (65,000 km) above the night side of the earth, on the boundary between the solar wind and the earth's magnetosphere."

"Since the 1990s, a handful of 'plasma mythologists' had assumed the former existence of a stupendous, luminous sky column that was visible from almost every part of the earth. The evidence for this was the prominent place allotted to this axis mundi or 'world axis' in detailed cosmological traditions from hundreds of cultures dotted around the globe."

The hundreds of cosmological traditions notwithstanding, vd Sluijs is here confusing the polar plumes with the Peratt column, discussed in a previous chapter. Obviously these polar plumes are not a "stupendous luminous sky column" of Peratt.

"The column was widely portrayed as a prodigious mountain, tree, rope, bridge, ladder or pathway and was universally characterized by notions of centrality, vitality, vorticity, and luminosity: the conspicuous position it occupied in the firmament earned it an association with the 'navel', 'heart' or 'centre' of the world; its agility made it seem as if it was imbued with life, like a giant divine creature breathing life into the surrounding cosmos; its filamentary extremities were subject to warping and twisting, while the column itself was seen to be entwined by spiraling filaments frequently compared to snakes; and the splendour of the light it emitted repeatedly invited comparison to the sun and to lightning."

"The difference between the mythical column and the tornadoes observed today appears to be one of scale only: an unusually strong bombardment of charged particles onto the ionosphere could have triggered the formation of a single collimated Birkeland current, of a semi-permanent nature, that was susceptible to a type of plasma instabilities known as 'Peratt Instabilities'."

-- Rens van der Sluijs

Well, not quite. "Could have" isn't close. The Peratt column was 400,000 miles (650,000 km) long, 10 times larger than the polar plumes. Otherwise I would agree with vd Sluijs that in a higher dark mode or in the initial level of glow mode the two separate "tornado" columns would merge, and form a single twisted pillar. Only in high glow mode and low arc mode would entwined columns appear. I doubt if the polar plumes ever switched to arc mode except at its contact point with the ocean and into the Earth's upper atmosphere, for the concept of "braziers" are certainly expressed in Egypt, and "flames" or "lights" in the *Chilam Balam*.

I do not agree with some of the forms that the polar plume is being equated to here -- the mountain, ladder, navel, heart, and the center of the world. These forms, and others, are to be associated with the plasma connection from Saturn under conditions of plasma instability of

extreme conditions (as noted in the text) -- and under parameters of a very large plasma connection extending over millions of miles, not thousands, and sustaining shockwaves which took months to form and propagate. A plume 40,000 miles long would not respond in that manner.

Van der Sluijs is confusing three distinct forms, which had only a casual visual relationship to each other: (1) the Peratt column propagated from the far south and which most often appeared near Earth as four lighted streams and bypassed earth (until 8347 BC), (2) the later singular column connecting Saturn in the north to Earth, which, because of its size, could also support extensive discontinuities for months (until 3147 BC), and (3) the polar plasma plumes, which, even at 40,000 miles, were minor apparitions and which came and went seven or eight times.

Van der Sluijs fails to mention that the plasma plumes would have been seen rotating from the east to the west every night -- "waving in the wind" like trees, or as smoke blowing down from fires, as depicted in Egypt. This sight could have been determined from the information presented by NASA. But NASA's plumes currently are in dark mode.

[\[return to text\]](#)

Note 11 --

We may think of Mars as a small planet, but when it appeared above Earth in this era it would have been gigantic, exceeding the previous apparition of Saturn in size. This happened not just in Egypt, but throughout the world, as signified by the fact that within a hundred years after Mars was last seen "on his mountain," that is, in plasma stream contact with Earth, pyramid construction starts everywhere. That suggests (as, for example, Patten and Windsor have done) that Mars continued to be seen periodically nearing Earth, but did not get all that close, although close enough to do considerable damage.

[\[return to text\]](#)

Note 12 --

There is a boom in population after 3000 BC in Mesopotamia, which cannot be attributed exclusively to agriculture (which had been long established there), or the fact that farmers tend to have more children. Population growth seems to have been very limited during the "Age of the Gods" and earlier -- almost a zero growth rate. One wonders if radiation from the plasma stream (which included ultra violet, radio, X-rays, high energy atomic particles, and gamma rays) did not inhibit births. In Sumer, in the second millennium BC, there are extensive laws (and records) governing adoption -- perhaps a holdover from previous times.

Exponential growth, however, often masks slow beginnings. We might at least acknowledge a new beginning for humans after 3147 BC.

[\[return to text\]](#)

Note 13 --

It is currently presumed that there were kings in Egypt before the first dynasty, often presented as "Dynasty 0" and including kings named after a number of animals -- Scorpion, Catfish, and others. But these names are only known from label inscriptions, and although they might point to some local chiefs or chief priests of temples, it is very doubtful if these were kings of a dynasty. It is difficult to determine anything for sure since all the graves were robbed in antiquity. However, and significantly, none of these predynastic kings of Egypt were acknowledged in the official chronicles. Additional notes on the predynastic kings may be found in Appendix A, "Chronology."

Recovering the Lost World, A Saturnian Cosmology -- Jno Cook

Chapter 18: Pyramids and Henges.

\$Revision: 42.66 \$ (oldk.php)

Contents of this chapter: [\[Horus on His Mountain\]](#) [\[The Palermo Stone\]](#)

[\[The Pyramids of Egypt\]](#) [\[Barrows after 3100 BC\]](#) [\[Henges after 3100 BC\]](#) [\[Endnotes\]](#)

Horus on His Mountain

This chapter starts (once more) after the flood of 3147 BC, but I will concentrate mostly on human endeavors, although the visits by Mars as Horus need to be recounted before we delve into pyramids and henges.

[Image: Bronze Age (circa 800 BC) petroglyph, Denmark. The "Sun" is carried through the sky on its ship. Note the oars. The boatmen are holding celts aloft. A figure is falling in from above (left). The other two figures are thought to be antlered elk. The composite is based on Mars and its two satellites, but is thought by others to represent Jupiter as the Midnight Sun. Source unknown.]

The first civilizations and the first kingdoms (as I have already noted) appear in Sumer and Egypt at this time -- in fact, within 100 years after the close of the "Era of the Gods." Horus (Mars) makes regular visits over a period of 300 years starting about 3067 BC. Humans start building pyramids after Horus fails to return.

When the Gods prepared to leave after 3147 BC, the "Era of Kings" starts. It starts with the devastating flood which the Mesopotamian *King List* tersely recounts as, "and then the flood swept over."

I originally used a date of 3114 BC as the end of the "Era of the Gods," but a more likely date is 3147 BC. The date of 3114 BC is the beginning of the current era (and the end of the previous era) as retrocalculated from the Maya Long Count chronology. This chronology takes no account of a number of changes in the length of the year, and is thus out of sync with solar years by some 35 years.

The date of 3147 BC, which I will use, is based on the clear intent of the Olmecs in instituting the Long Count in 747 BC. See the chapter "The Maya Calendar," for details on this.

Recovery after the flood was quick -- less than two hundred years in Northern Mesopotamia and much less time in Egypt -- and ushered in the seminal age of the civilizations of remote antiquity. In Mesopotamia and Egypt we see a development of agriculture, the scope of which goes beyond anything seen in the preceding centuries. Writing developed rapidly, and possibly independently, in the two regions. Work started on larger and larger monumental structures, culminating (400 years later) in the giant pyramids of Giza. The expansion of civilization after about 3100 BC seems to be indicated with the sudden elaboration of certain graves -- those of selected individuals, which are generally thought of as rulers by archaeologists. The age of kingdoms has started. The graves of the first pharaohs of Egypt date from the century after the flood. Elaborate graves show up in Mesopotamia at about the same time. [\[note 1\]](#)

Loosened from the grip of Saturn in 3147 BC, Earth and Venus were cast off on nearly identical elliptical orbits, Earth with a year of 240 days and Venus following Saturn's old orbit with a year of somewhat more than 225 days (perhaps 230 to 240 days). In aphelion (the furthest location from the Sun) the orbital path of Venus extended past the orbit of Earth, but Venus came closer to the Sun at perihelion (the closest location to the Sun) than the Earth did.

Mars and Mercury were not released until 80 years after 3147 BC, if we can assume that the very late recollections of the Egyptians, *The Contendings of Horus and Seth*, is correct. At that time Saturn had entered the first of the asteroid belt, and loosened its grip on Mars and Mercury. This late and far-distant release accounts for the very elliptical orbits which these two planets assumed, although almost nothing is known of the orbit of Mercury, except that we can assume that it was nearly identical with the orbit of Mars. Mercury thus frequently swept past the Earth, and continued to do so periodically until 686 BC.

Mercury shows up iconographically in circa 3050 BC (a date which I think is too early), depicted as the sandal carrier of the figure called Narmer on the Palette of Narmer, where Narmer clearly is Mars, that is, Horus, enveloped in a plasma stream from Saturn to Earth.

Mercury, as far as we can tell (and verified by the text of the *Chilam Balam*), shows up as a constant companion to Mars. The *Chilam Balam* reads:

"With it descended Bolon Mayel [Nine Fragrances]; sweet was his mouth and the tip of his tongue. Sweet were his brains."

... where "it" is Mars, mentioned a few lines earlier.

Mercury of course, is Thoth of the Egyptians -- Hermes or Apollo of the Greeks, Mercury of the Romans. It is not the Moon, as some current mythologists think, a concept which is based on not allowing Mercury any other place in the solar system of the past except on its current orbit very close to the Sun.

Subsequent to this time period Mercury shows up again periodically, suggesting that the second nodal point of its orbit may have rotated away from Earth's orbit, to return a thousand years later (as Mars did also). Thoth seems to assume a presence again (with Mars) one- or two-hundred years before 1936 BC, where 1936 BC is the start of the time of the destruction of Sodom and Gomorrah. Mercury and Mars appear a third time throughout the 8th and 7th century BC. Mars and Mercury almost universally become identified as celestial twins. Their appearances are at approximately 1130 year intervals.

I became aware of Mercury while sorting out the details of the Maya *Chilam Balam*, where it looked as if Mercury showed up near Earth at the same time as Mars in the 8th and 7th century BC. In the *Chilam Balam* Mercury is recorded as appearing 9 times during the period when Mars also showed 9 times, as indicated by their name prefix "Bolon" (for both Mars and Mercury). At the time I was doing an analysis of the *Chilam Balam* I had already surmised that Mercury would have been one of two planets seen close to Earth in the earlier period of 3067 BC to 2700 BC (the other being Mars, of course). This defines an interval of about 1150 years. I determined the midpoint between the earliest showing in 3067 and the much later first showing in 806 BC with simple arithmetic: such an interval would remain the same for circular orbits.

It is perhaps easier to track the orbit of Mars and, in fact, at a later time it is possible to make some guesses of the orbital parameters from scarce data incorporated into the calendars of Mesoamerica, and to deduce some orbital values from the considerations developed by Patten and Windsor (in *The Mars-Earth Wars* (1996).

Mars's orbit thus initially started much further from the Sun than today (as did Mercury). At aphelion the orbit grazed the edge of the asteroid belt; at perihelion Mars periodically rode over the orbit of Earth or moved past Earth at a relatively close range. Mars first showed up close to Earth probably in circa 3067 BC (80 years after 3147 BC). As I pointed out above, the curious thing about Mercury and Mars is that both in the period directly after 3067 BC and in the 8th and 7th century BC, they show up (or seemed to show) together. [\[note 2\]](#)

The evidence for the orbits of the inner planets after the event of 3147 BC consists of the fact that these orbits represent the conditions most likely to allow the series of interactions which would happen over the next few millennia. See Appendix B, "The Celestial Mechanics," for additional details. Year counts and dates are developed in Appendix A, "Chronology Notes."

The *King List* reads, for the first king after the flood, that "Kingship again descended from Heaven." This was likely to be the appearance of Mars close to and above the Earth in circa 3067 BC. Mars would continue to "visit" Earth at intervals averaging 30 years as long as the inclinations of the orbits of Earth and Mars were favorably aligned. In fact, based on data from after 806 BC, it looks like Mars passed close to Earth every 15 years, alternating a course set for the Sun with a return overflight (or close passage) in coming from the Sun 15 years later.

Some of these "visits" consisted of destructive close passes, where Mars passed close to the Earth's surface, resulting in traveling lightning strikes, hurricanes of burnt material, and seismic disturbances. We know this from the 8th and 7th century BC, earlier from the archaeological conditions at the sites of Sodom and Gomorrah, and much earlier from sparse remarks on the first history of Egypt by Manetho.

Mars would have repeatedly been sighted every year and a half over an extended period of time, since the orbits and the overpassings all manifest on a circular coordinate system. The orbital periods would not likely have changed in 2000 years, and thus the intersection of orbits would repeat on the same calendar dates. The sightings of Mars, even without electrical contact, would occur at 1.5-year intervals of 240-day years. (The synodic period of Mars at this time would have been 360 days.)

With the first appearance of Mars in 3067 BC, the Egyptian priesthood was suddenly vindicated in its belief in resurrection. The suddenness with which the concept of a life after death takes hold in Egypt after 3147 BC, is astounding, although it probably existed already, based on the assumed function and purpose of the southern ball plasmoids.

Initially a further existence among the stars and planets (the home of the Gods) was limited to the pharaoh, but by the time of the first dynasty (after circa 3050 BC) the privilege of participation had spread already to the elite of the court, and would eventually be extended to everyone.

Today, of course, the idea of a life after death is nearly universal among contemporary religions, with Theravada Buddhism and Judaism being, for example, exceptions. The concepts spread only slowly in Europe with the introduction of Christianity, although there were ideas about resurrection extant among the Celtic tribes at that time, but not among the Greeks and Romans.

The only tie to a more remote antiquity for these ideas would seem to be concepts derived from the parades of animals seen in the skies and recorded by the first Cro-Magnon in

Southwestern Europe and, of course, seen and pondered upon by everyone else, and everywhere else, over the next 30,000 years. Plus, especially, the objects or beings seen traveling along the four overhead lines of electrons toward the south between 10,900 BC and 8347 BC.

... the mountain

In about 3067 BC, Horus (Mars) first appeared from some location in the ecliptic of the south sky, looming larger and larger until it was obvious that it would reach Earth. Horus was understood to be the resurrected Osiris, or (more logically) the son of Isis by Osiris, even though Osiris had been dead for some time. But he had been seen with an erect penis projecting through his mummy wrappings. He was depicted as such in statuary of the delta region as the God Min. When the worship of Osiris takes hold after the fifth dynasty, Osiris is always shown as a standing mummy and ithyphallic. [\[note 3\]](#)

Mars would have seemed to slow as it neared, since both Earth and Mars were at this point about the same distance from the Sun and thus traveling at nearly the same speed. As Mars reached closer to Earth a plasma stream would form between the two planets. Mars would have an unbalance of negative charge (because it came in from the region of the asteroid belt). Earth held the surplus charge, since it was a much larger globe, and it was Earth which bolted Mars.

Because Mars is half the diameter of Earth, the stream of plasma would have looked like a conical mountain, leaving the Earth's ionosphere and converging to a smaller truncated cone on reaching the surface of Mars.

The details of the mechanics are this: the plasma stream could easily have traveled ten or twenty Earth diameters -- making the distance to Mars 80,000 to 160,000 miles (130,000 to 260,000 km). This is considerably closer than the distance to the Moon today (250,000 miles). Mars, which is twice the diameter of the Moon, would have looked like an absolutely giant sphere in the sky.

Any view of this stream of plasma in glow mode would have been severely foreshortened to people viewing this. Instead of a 100,000-mile-long stream of plasma (as a lateral view from space might reveal), it would have looked like a truncated geometric figure. Because the edges of this would have been denser, it would easily have looked like it had flat sides, and was therefore rectangular -- like a pyramid. Its shape would also have suggested a chair or a seat. The idea of a chair -- a seated God -- becomes the iconography for depiction of the Gods.

The pyramidal shape beneath Mars was the sacred mountain frequently referenced in ancient literature. Appearances of the mountain of Mars lasted a hundred years longer than Jupiter's mountain, which disappeared in about 2860 BC.

Jupiter and his green colored mantle, a plasma outpouring from its south pole, was understood to be the standing mummified figure of Osiris, and was seen receding into the night sky. The giant mountainous lower coma of Jupiter had initially appeared in 3147 BC. It disappeared in about 2860 BC, when Jupiter entered the asteroid belt -- 100 years before the visits by Mars ended.

I initially thought the cone of plasma of Mars could only have happened if Mars overrode Earth at Earth's North Pole. That was my view on things from a grand exterior perspective, and partially based on keeping the conical throne viewed in daylight. But on further reflection I realized that the cone of plasma would still be understood as a mountain even if this happened with Mars in a lateral position with respect to Earth, and even as earth kept rotating and Mars kept advancing past Earth.

Certainly the cone would show when Mars was past the shadow of Earth: in the pre-dawn sky or after dusk. When Mars moved behind the Earth in the darkness of night, the cone would probably not be seen at all, especially as Mars passed by Earth at a considerably closer distance. This would be the time of massive electric discharges -- rather than the mostly benign transfer of electrons via a glow mode plasma exchange.

The phrase "coming to sit on his mountain" for Mars/Horus would seem to have reference only to these periodic approaches. Jupiter did not "come to sit." It remained on its mountain form, day and night. When Mars passed behind Earth, its seat might have disappeared. The idea that everything goes out of control when a celestial god gets up from his seat is a concept which will remain active for a thousand years or more.

The mountain form of plasma did not start to glow at the Earth's surface, but more likely some hundreds of miles above the ionosphere, which is located about 200 to 600 miles (320 to 1000 km) above the surface of the Earth. Everywhere the cone would appear as a squat mountain with sharp edges (where the plasma was most dense), and thus approach the typical look of the later pyramids whose sides rise at an angle of near 60 degrees from the horizontal and are constructed in rectangular shapes. When backlit by the Sun, the cone might easily have passed for a pyramidal structure. In the absence of pyramids, or any multi-story temples, it would be called a mountain. [\[note 4\]](#)

In addition to the infrequent very close (and damaging) passes of Mars, at other times Mars would show up near Earth, but on different calendar dates, and would pass above the Earth (but not likely below). And again, a conical plasma stream would develop as Mars passed over the Earth. The effect would be nearly the same as when Mars passed directly over the northern hemisphere of Earth, except that the cone would be seen to rotate around the North Pole of the Earth. During such visits, Mars would seem to sit for a period on the conically shaped "mountain" throne of plasma streaming from the Earth's ionosphere. [\[note 5\]](#)

The rotation of the Earth would make it look as if Mars rose and set, that is, moving from the northeast horizon and downward at the northwest horizon. The movement from the east to

the west on a daily basis (perhaps lasting only a few days) would continue at night as the cone was lighted by the Sun from the daylight side of Earth.

The result of this was that religious structures were no longer oriented northwest to the apparent strike points of the arc of the previous era, but were aligned to the true geographic north, the centerpoint of the traveling mountain of Horus.

This truly was Horus, as the resurrected Osiris, coming to sit on his Earthly throne and rule Egypt. The tale of Osiris, resurrected as Horus, will stand for more than 3000 years, although it is only incorporated solidly into Egyptian religious practice after 2349 BC. By the time of the first "pyramid texts" (of 2349 BC), which quote from what will eventually be known as the *Book of the Dead*, the spells and prayers which invoke Osiris and Horus were already 700 years old and firmly established (with some dating to much earlier times). They change very little over the next 2500 years. I should also point out that, except for the very few pre-dynastic kings and one of the pharaohs of the second dynasty, all the kings or pharaohs have "Horus names." [\[note 6\]](#)

It can be assumed that Mars returned with some regularity, since the visits depended only on the regularity of planetary orbits and the apsidal precession of the elliptical orbits of Mars and Earth. As mentioned above, the synodic period of Mars was 360 days at this time, so that Mars would approach Earth every year and a half (the Earth's year being 240 days). The positioning of Mars over the Earth might last a few days or a week. [\[note 7\]](#)

One would expect that as Mars approached Earth it would be gravitationally attracted. But there is no indication that the orbit of Mars was changed at all in nearly 3000 years. Gravity between these small planets is minuscule compared to the forward momentum of orbital travel.

Patten and Windsor, in *Mars-Earth Wars*, use the concept of gravitational attraction to suggest a change in the Earth's orbit (the length of the year) and the location of the Moon. But the movement of the planets is overwhelmingly controlled by the Sun and inertia. Catastrophists researchers (Patten and Winsor included) seem to completely neglect the momentum of planets -- which keeps them from making any radical changes in their orbits.

It should be recognized also that the mass of Mars is considerable; it cannot be compared to a meteorite or other bolide which certainly will experience the Earth's gravitational attraction and change its path of travel. It is the orbital momentum of Mars (its mass times the square of its orbital speed!), which will carry it forward as if only the Sun's gravitational pull keeps it on its orbit, even when Mars was closing in on Earth.

If Mars overrode the orbit of Earth, as I have suggested, we can be certain that neither gravitational nor electric interactions would change its orbit significantly. Only the inclination of the orbits to the equator of the Sun might be effected. Considering the immense values of forward momentum involved in travel along orbits, even changes in inclination

would be all but undetectable. [\[note 8\]](#)

It could also be suggested that there are radical variations in the number of years between close approaches of Mars, for this could be seen in the reigns of kings in Mesopotamia (at Kish) and Egypt (the first two dynasties). These last four periods which only average 30 years, but are as short as 24 years and as long as 36 years. The reign lengths are, at any rate, much too long to make sense for human kings. The ten patriarchs of the Bible born after Noah (from Shem through Abraham) were each sired when their fathers were 29, 30, 32, or 35 years old. This section of the Bible records the repeated visits of Mars as the appearance of new generations of patriarchs.

The "visits" by Horus, as seen from Earth, were thus seen as an approach of Mars from deep space, followed by a seating on the plasma mountain, a circumambulation of the Earth (visually caused by the Earth's rotation), after which Mars was headed out for the region of the Sun (or returned to the deep reaches of space). [\[note 9\]](#)

Every observer in Egypt, Sumer, and among the shepherd forefathers of Abraham, considered that Mars had come out of the far distant sky as a resurrection of his previous self or as a new God or person altogether. This is particularly obvious in Egypt, where apparently every new appearance of Mars/Horus was understood as a newly resurrected Horus. In Sumer, each in the series of kings is described (as Mars) as distinct personages, with distinct qualities and behavior.

It is certain that this type of thinking, which would be totally foreign to us, derived from the 2500 years of observations made in the remote past, when it was understood that all animals and humans traveled south after death, via the lines in the sky, to go to the large plasmoids. No one ever traveled north.

It seems that the "Sed festival," which required the pharaoh to race along a course and to be twice recrowned as king, might have been suggested by the behavior of Mars. Predynastic ceremonial objects (grave goods labels), dated to before 3000 BC, already suggest the Sed festival. This strongly suggests a much older tradition as the basis for the Sed festival. [\[note 10\]](#)

The engraved labels are recognized today because the iconography remained the same for the next 3000 years. By the third dynasty, circa 2639 BC, separate buildings and plazas were constructed for this purpose as part of the pharaoh's funeral temple, so the festival could also be performed after death.

"One of the most important elements in the heb-sed [Sed festival] was a re-enactment of the coronation. In this ceremony a procession led by a priest would enter those of the chapels surrounding the heb-sed court in which were gathered the gods of the nomes of Upper Egypt. Having obtained from each god consent to renew his kingship, the king would be conducted to the more southern of the two thrones, placed on a dais beneath a

canopy, in order to be crowned with the white crown of Upper Egypt."

-- I.E.S. Edwards *The Pyramids of Egypt* (1972).

This note by I.E.S. Edwards seems to make clear that there was no conquest of the delta by the forces of Upper Egypt. There was, instead, the permission granted to rule, or at least to represent the nomes. If indeed these ceremonies dated back to the time of the southern plasmoids, there would have been thousands of years to reach such agreements among the many independent nomes. Edwards continues:

"A similar ceremony would be repeated in the chapels of the gods of the Lower Egyptian nomes before the king ascended the northern throne to receive the red crown of Lower Egypt. The unification of the two kingdoms would be symbolized at a later stage by lacing lotus (or lily) and papyrus flowers around a stake driven in the ground."

"The significance of another ceremony in the heb-sed is not so apparent. The king, carrying a flail, would run a fixed course, accompanied by 'the priests of the souls of the Nekhen'."

The "nomes" are the separate districts of Egypt, some 20 of them in Upper Egypt and an equal number in the delta, each with their own Gods, temples, and temple administration. The "Nekhen" are the previously deceased pharaohs (called "falcons"). Notice the double enthroning, or as Edwards calls them, "coronations." I suspect the course was run between the coronations. As always, the ceremonies of the humans were those first performed by the Gods.

The previous kings -- the Nekhen -- were also Gods. They were known, into the 5th dynasty, as "the followers of Horus" (although this is not clear). More on this below.

The Palermo Stone

Egyptian records (the *Turin Papyrus*, and the writings of Manetho) give Horus a total life span of 300 years, which would mean that Horus would have returned 10 times between 3067 and 2770 BC, if a 30-year interval held for all of that time period. The Sumerian list of the "kings after the flood" adds up to 300 years and includes 20 "long-lived" kings up to about 2700 BC. But, counted in sets of two, these reduce to some 10 distinct pairings of periodic crossings of Earth's orbit or close approaches by an entity in the sky, which averages to 30 years, but varies by 4 to 5 years in both directions. The variation may be due to the actual lifetimes of kings or chief priests who played the role of God. [\[note 11\]](#)

The orbital period of Mars as seen from Earth (its synodic period), was 360 days. I have developed this in an endnote. The Olmecs, predecessors to the Maya, apparently kept track of the regular return of Mars to the same location in the sky, and codified this into their

calendar. Mars would have shown up near Earth every year and a half (years of 240 days). This implies a different orbit for Mars from that of today, although even today Earth passes by Mars every two years. But in the period directly after 3147 BC, Earth was on a considerably smaller orbit, and Mars on a larger orbit than today, and on a much more elliptical orbit, extending to the region of the asteroid belt.

Since Mars is about twice the diameter of the Moon, to appear as twice the size of the full Moon, Mars would have to approach to within 125,000 miles (200,000 km) of the Earth. Mars would show as a red disk in the south sky at night. At this distance Mars would be within the plasmasphere of Earth, and the "mountain" would form in approaching Earth and in leaving the vicinity of Earth. The cone of plasma would be seen as Mars approached Earth, and as it left, but not likely when Mars passed close to Earth on the night side.

After Earth passed Mars (or Mars passed Earth), Mars would have disappeared from view for the next few solar years.

[Image: Palermo Stone, partial record of King Den of the first dynasty, circa 2950 BC. The text reads from right to left; each block is introduced with a "year glyph," the curved line at the right edge of each year's record. The lower register records the height of the Nile at flood time. A few hieroglyphs stand for whole words; the rest represent sounds. Year names, from the right (1) Striking the bedouin. (2) Appearance of the power (king) of Upper and Lower Egypt; Sed festival. (3) Counting of the people (of the four directions). (4) Second feast of Djet. (5) Plan of a temple called "Thrones of the Gods," feast of Sokar. Section from P recto, bottom register; after Michael St. John.]

The *Palermo Stone* records the yearly appearances and visits of Mars. The *Palermo Stone* is a carved basalt block from the Fifth Dynasty (circa 2550 BC) of the Old Kingdom, unfortunately shattered and badly worn, and reduced to seven small fragments. The *Palermo Stone* records the Gods, the "Followers of Horus," and some of the pharaohs of the first five dynasties, in that order. For each of the pharaohs (on the fragments we possess) there is a catalog of years, with each year named after an important event, for example, "The Year of the Cattle Count."

There are some six distinct events which are recorded repeatedly on the fragments we have -- plus military excursions into the region adjacent to the delta, the acquisition of desirable materials like honey or lumber, the building of ships, plans for new temples, and other mundane activities. The frequently recorded events (for which years are named) are:

- "The Appearance of the King of Upper Egypt"
- "The Appearance of the King of Lower Egypt"
- "The Followers of Horus"
- "Union of the Two Lands" followed by
"The Circumambulation of the Wall"
- "The Counting of Cattle"

The "Counting of Cattle" at later dates is often recorded as "The 'nth' Counting of Cattle." The height of the Nile at flood time was also recorded for each year.

The year-names listed above should actually be translated somewhat differently, for archaeologists have rendered the original phrasing into terms more familiar to us. "The Appearance of the King of Upper Egypt" should read as "The Appearance of the King of the Upper Land" or even as "The Appearance of the Power of the Upper Land." The Egyptians called their country "The Land"; the Greeks called it "Egypt."

The "appearances" of the King of the Upper Land or the Lower Land happen regularly every two years, although not always at exactly two-year intervals. At times we read of both events happening in the same year. Interspersed at two-year intervals is the year-name "The Followers of Horus."

What exactly are these events? Archaeologists have suggested that the "appearances" were visitations of the pharaoh to the delta (Lower Egypt) and up river (Upper Egypt), perhaps as celebrations or as gift-giving opportunities. That is, "appearances" were made by the pharaoh to the two separate sections of the country. The pharaoh otherwise resided at Memphis, the city at the apex of the delta, and thus exactly between Upper Egypt and Lower Egypt. Memphis had been founded by the first king of the First Dynasty. Memphis controlled traffic between Lower and Upper Egypt, and in effect constituted the "unification" of Egypt.

Similarly the "Union of the Two Lands" was thought to be a celebration of peace (after another rebellion had been squashed), done with a walk (some original texts are translated to "race") around the outer walls of Memphis. Memphis had massive walls in antiquity to keep the Nile from flooding the city. Memphis was known as "White Walls."

... Sed festival

The "Union of the Two Lands" with the "Circumambulation of the Wall" is always shown as the first year-label for a pharaoh. It might be suggested that the "circumambulation" is the

Sed festival. It might also be suggested (and I suspect this) that the pharaoh was replaced when Mars again showed up near Earth, and thus at 15 year intervals.

[Image: A cattle count of large and small animals, and other activities. Scene from the Narmer Macehead, circa 3050 BC. After Marshall Clagett.]

A scene depicted on the Narmer Macehead (circa 3050 BC), shows Narmer's name tag on the upper left. On the top right is a depiction of the temple at Buto in the delta (others suggest the temple at Nekhen, Hierakonpolis). Three running figures between triple lunates are suggested as representing a Sed Festival. The lunates are boundary markers.

Poles carried by four figures at the top are supposedly the standards of four of the nomes of Lower Egypt (actually, there are 20 nomes in the Delta region). From other sources these are thought to be the "Followers of Horus" instead. I feel that they much more likely represent the four cardinal directions, discussed in the previous chapter.

Two of the four standards depict the hawk of the east and the hawk of the west. The third standard, the stomach or placenta sign "lugal" (the Mesopotamian glyph for "king"), signifies "the south" (and thus the earlier ball plasmoids), and the fourth standard, a jackal on a plow, signified "the north," representing the constellation Ursa Minor. The east and west standards each seem to have a vertical banner like a flag attached. This occurs also in Sumerian iconography: two standards with banners attached and animals on top (in the case of Mesopotamia these are small lions). The same flags are attached to the standards as shown on the Palette of Narmer.

Animal counts are shown at the bottom. The seated figure with his arms up in the air denotes a "million." The "Cattle Count" has drawn archaeologists' remarks to the effect that this must be a complete fiction, based on the actual numbers listed on some predynastic objects, like the macehead described above, showing, for example, 400,000 cattle, 1,422,000 goats, and 120,000 bound captives. 1,822,000 herd animals are depicted. This exceeds what the population of Egypt, estimated at between 500,000 and 800,000, could have managed or

supported. Similarly, 122,000 captives would have represented twenty percent of the estimated population of Egypt. The rounded numbers of the count suggest estimates rather than actual counts. But I think we are not dealing with animals and captives here.

... the Followers of Horus

Lastly (on the Palermo Stone) we have the "Followers of Horus." Most modern text books simply avoid mention of the "Followers of Horus" for no one can even imagine what that year-name could mean. What I will suggest is that these entries record celestial displays of close followers of Mars. It is an assembly consisting of the Maruts, the Trojan followers of Mars (identified also in Vedic documents). What I am suggesting thus, is that Mars, in addition to being followed (and maybe preceded) by a huge cloud of debris consisting of millions of rock fragments of asteroids, was followed by a number of larger asteroids.

[\[note 12\]](#)

Later descriptions in the 8th century BC suggest that Mars was still accompanied by hundreds or thousands of asteroid-like bodies. We have only limited clues that these existed, and no indication of the number, the sizes, or the exact location with respect to the planet. And, located some distance away along the orbit of Mars, there followed some six larger asteroids, identified in Vedic sources as the six Maruts; seven when counted with Mars. These six are still following Mars, and have been detected. [\[note 13\]](#)

Gary Gilligan, in *An Ancient World in Chaos* (2008), has demonstrated that, with very few exceptions, the hundreds of battles that Egypt fought over a 3000-year period, always led by the Pharaoh and always won by the Egyptians, never happened on Earth, but were observed to have happened in the skies. He points out the complete lack of archaeological evidence for any (or for most) battles. For example, at the Battle of Kadesh in circa 1287 BC, probably the most famous battle of antiquity, 20,000 Egyptians engaged 40,000 Hittites. Yet not one bone or war artifact has been found despite the inscriptions by Rameses II telling of tens of thousands of dead soldiers. Gilligan claims that Kadesh itself also has not been found.

Similarly, notes Gilligan, at Megiddo some 34 battles were fought, including 14 by Tuthmose

III. "Yet," Gilligan writes, "no corroboratory archaeological evidence exists." The battles were fought entirely above the Earth. Thutmose III is traditionally placed in 1479 BC to 1425 BC. Velikovsky places him in the tenth century BC, after Solomon. [\[note 14\]](#)

"To put this into some kind of context, Megiddo is a location where hundreds of thousands of soldiers engaged in numerous battles over a period of 3,000 years -- thousands of chariots, battle axes, spears, bows and arrows, the carnage, dead soldiers, etc, etc, and yet no archaeological evidence remains to corroborate them as ever taking place -- nothing. We have an abundance of written documentation but -- NO CRIME SCENE! This despite the fact that archaeologists have been digging there for decades."
-- Gary Gilligan [\[www.gks.uk.com\]](http://www.gks.uk.com)

Gilligan is using standard chronology, or none at all. Velikovsky places Thutmose III 500 years later, and has Megiddo as the site of a peaceful capitulation of Jerusalem by its king, Rehoboam. Jerusalem is one of the mysterious cities named Kadesh, which means "sacred place".

Eva Danelius, in "Did Thutmose III Despoil the Temple in Jerusalem?" in *Chronology & Catastrophism Review* (1977/78), also claims that Megiddo was never sacked, and that the goal of Thutmose III was to reach Jerusalem. Which he did.

The battle of Megiddo was designed as an overwhelming show of force by Thutmose III, who traveled up the coast road to Megiddo where the king of Jerusalem and all the kings of the other principalities of Israel were holed up. This is what Dale F. Murphie claims, writing in "After 200 Years It's Time to Get Serious About Dynasty XVIII and Thutmose III" in *Aeon* (1998).

Danelius also explains why Judah was called "God's land" by the Egyptians, and why Thutmose III took extraordinary religious protective measures in passing through this region. As Danelius relates, the stones which had fallen on Joshua's enemies 500 years before Thutmose III, are in fact still known today and can be identified.

When Mars and the asteroid swarm neared Earth, a parade of objects would move from west to east past Earth (the celestial direction), but seen daily or nightly as moving east to west -- first the Followers of Horus, then the dead prisoners, followed by the cattle, large and small, and finally Horus himself, followed by his sandal-carrier, Mercury. This is the order depicted on the top register of the "Palette of Narmer" of circa 3050 BC. The cattle are not shown and the Followers of Horus are on the reverse side. If any action by the Gods would suggest a procession to us humans, it would have been this parade. A parade of animals had been recorded before in Egypt, before the first kings, on cosmetic palettes, knife handles, and combs. [\[note 15\]](#)

It seems reasonable to suggest that Mars was not only accompanied by asteroids after 3067 BC, but this was still so in 800 to 700 BC. The suggestion comes from predynastic Egyptian

palettes and engraved objects, the record of the Palermo Stone, and from later descriptions of Mars, even though these date to after 800 BC -- 2000 years later. Immanuel Velikovsky, in *Worlds in Collision* (1950), collected many Vedic and Biblical recollections of Mars and its companions in the 8th century BC -- the "Maruts" of India are the "hosts of the Lord" of the Bible.

Horus (Mars) is listed in the genealogy of the Gods as the "second Horus." The first Horus (also Mars, but before 3147 BC) is known as "Horus of the Gods." Mars would have been recognized at close quarters by its pockmarked lower surface and smooth upper half, an upper ocean which lasted into the 8th century BC, and certainly by its red face. The 5000-mile (8000-km) scar came after 800 BC, I suspect.

The cratered surface of Mars, which extends across the lower half and crosses its equator at an angle (today), may have been the model for the distinctive dress of priests, shamans, and kings in Asia, Egypt, Africa, and Mesoamerica. The wearing of spotted leopard or jaguar skins -- over the shoulder -- is certainly a feature of later history. Although Hercules of Greek mythology wore a lion's skin. The "distinctive dress" of the pharaohs depicted on predynastic ceremonial mace heads may represent an animal skin worn over the shoulder, as does the pharaoh depicted in the Sed Festival sculpture at Djoser's pyramid complex, built in 2650 BC, and thus 100 years after Mars had last come close. At later dates in Egypt, however, only priests wore leopard skins. The African leopard was all but driven to extinction in antiquity, and is still a threatened species today.

What is less suggestive of an imitation of Mars is the "flail" carried by the pharaoh in running the course of the Sed Festival. Archaeologists call the hand-held object a "flail" because that is what it looks like. Why this object needed to be carried while running is unknown. Because the flail appears already in the Narmer Macehead (dated to circa 3050 BC), where it is held by a mummified figure, well before Mars first shows up, it could be suggested that the flail is a heteromac or bramble bush -- the "sweeping devices" identified with the overhead lines of electrons at the time of the southern plasmoids, and last seen thousands of years earlier. [\[note 16\]](#)

If Mars was released when Saturn had already entered the asteroid belt, as I have assumed, Mars probably could have swept innumerable asteroids along into the new orbit around the Sun. Jupiter seems to have done this also, for there are thousands of asteroids in Jupiter's orbit. These asteroids are known as the "Greeks" and the "Trojans." The first "Trojan" asteroid of Mars was discovered in 1994. Six are known today. [\[note 17\]](#)

... Maruts

Cardona, in an essay titled "Indra" (*Aeon* 1982), mentions that the original Indian sources list the Maruts as seven. Add Mars (whose name is derived from Marut) to the six Martian Trojans known today, and we end up with seven also. This is a marked change from

Velikovsky, who thought the Maruts were comets following Mars, and others, even Alfred de Grazia, who all but reduces the Maruts to the moons of Mars:

"It is famous that Mars is accompanied by two small moons. With the Vedas in mind, we can call them the Maruts, but the Maruts were many bodies. Jerry Ziegler and Donald Patten, among others, have found numbers of references to and descriptions of the behavior of the late principal Maruts, unmistakably the satellites Demos and Phobos, Rout and Terror, which, although not seen by modern observers until Hall's report of 1887, were well known to the ancients of many countries."

-- Alfred de Grazia, *The Iron Age of Mars* (2009)

It is unlikely that all the companion asteroids of Mars would have relocated to the same 60 degree nodal points of the orbit of Mars during the first 300 years. In fact, from the records of the near passes of Mars some 2000 years later (in the 8th century BC), it seems that at least some of the cattle and companions of Mars still remained close to the planet at that time. During the predynastic times of Egypt (and perhaps during the first and second dynasty) the count, as mentioned above, ran into numbers over a million for the cattle. The "Followers of Horus" are likely much larger asteroids. They count only to six (Vedic sources), and still exist today.

It is always possible that the "Followers of Horus" are represented by the four standards shown carried in the predynastic Palette of Narmer and the Macehead of Narmer. One later depiction adds one additional standard. (I would suggest that the fifth standard represents Jupiter, identified in Mesoamerica as the green fifth tree of the center.) Comparing the predynastic maceheads to much later fifth dynasty (after 2500 BC) inscriptions, N. B. Millett wrote in 1990:

"From the fragments of a similar scene from the Abu Gurab sun-temple we know that the four standards [together] represent 'the followers of Horus, the gods, the souls [of the city of] Pe [Buto],' that is to say, the ancestral kings of Lower Egypt.

-- N. B. Millett, "The Narmer Macehead and Related Objects" *Journal of the American Research Center in Egypt* (1990). [\[note 18\]](#)

But another predynastic mace head, attributed to a king Scorpion, shows seven standards (with animal figures at the tops) each with a bird hung by the neck.

... Hercules

The heroics of Mars are recorded as the ten labors of Hercules by the Greeks, although reduced to narratives only after 600 BC. But in their origins these adventures certainly reflect the ten visits between 3067 and 2700 BC. Hercules is almost always herding cattle, stealing herds of cattle, retrieving stolen cattle or horses, or gathering armies to attack some region of

Greece. Similar travel tales exist in India (Indra), and much earlier in Mesopotamia (Eridu and Gilgamesh). The travels of Mars become the literary model for the quest sagas of later ages. The dramatic travels of Hercules were repeated with the nine close contacts by Mars in the 8th and 7th century BC. It is probably these last appearances which form the core of the tales of Hercules dating from late antiquity. [\[note 19\]](#)

Whatever happened in the skies was duplicated on Earth. However, even after the celestial events no longer occurred (by around 2700 BC), the ceremonies continue on Earth. This makes it difficult to separate the celestial events from the ceremonies instituted by the priesthood and the pharaohs. In the meantime, Egypt might have instituted earthly cattle counts, for these start to appear every other year by the fourth or fifth dynasty. The Sed Ceremony remains celebrated at odd intervals far into the future.

The "Upper Land" becomes equated with the Nile river valley south of the delta (up river), just as the "Lower Land" becomes the land of the Nile delta. This reflects the flow of the river Nile. But another location of the "Upper Land" is revealed in a striking statement for year 2 of the Palermo Stone record for the pharaoh Djoser of the third dynasty (2667 to 2648 BC), which reads, "Passing of the Upper Egypt King by the two Pillars." The King of Upper Egypt (the Upper Land) is Mars on its orbit on the ecliptic, in this instance at a time of year when the ecliptic dipped below the upper edges of the Absu. The pillars which are passed by the King of the Upper Land are the sides of the gates to the Underworld seen at night in the south, the left and right edges of the shadow of Earth cast upon the Absu at the time of the equinox.

Another interpretation of this is to assume that the "pillars" are the east and west plumes. These are frequently depicted on Mesopotamian cylinder seals as the doorposts on which the gates of heaven hinged.

[Image: The relocation of the orbit of Earth or Mars about the Sun due to apsidal precession of the second nodal point (perihelion precession). Illustration after Wikipedia, public domain.]

Certainly by circa 2700 BC, it is over. Mars no longer visits Earth. Likely the normal

precession of the orbits of Mars and Earth caused them to diverge from each other so that the inclination of the two orbits was no longer coincident. The precession of an orbit is the slow rotation of the second node of an elliptical orbit around the Sun.

Orbits are ellipses, and have two centerpoints, called nodes (or focusses). One node of an orbit is always located at the Sun. The second node of the elliptical orbit is located away from the Sun, and slowly relocates in a circle around the Sun. That's orbital precession -- absidal precession. Today the precession of the Earth's second node takes an estimated 112,000 years to revolve once around the Sun, so that the orbit today moves only a quarter-minute of a degree per year. With both the Earth and Mars on considerably more elliptical orbits 5000 years ago, precession apparently was much greater than today.

After 2770 BC, when Mars no longer comes close to Earth, humans start attempts to induce the return of the God. The graves of the pharaohs change from mastabas to pyramids in the likeness of Horus's mountain.

The Pyramids of Egypt

The first step-pyramid is built by Djoser (3rd dynasty, circa 2667 -- 2648 BC) at Saqqara. The pyramid is surrounded by an astoundingly beautiful and complex set of outbuildings and courts. Half of the buildings are fake or present only façades, a good indication of the status of intent -- rather than action -- in the theology of Egypt at that time.

The pyramid of Djoser is totally different from the earlier mastabas. Djoser's pyramid is aligned north-south, facing the center of the travels of Mars/Horus about the North Pole of Earth after 3070 BC, unlike the earlier mastabas which were aligned to the northwest -- the strike point of the plasma stream from Saturn before 3147 BC.

I should also note that this building is not an imitation of the mountain form of Jupiter (which at any rate was much steeper), for Jupiter was at this time in the asteroid belt (for a period of about 390 years, circa 2914 BC to 2527 BC), and the giant outpouring at the bottom of Jupiter had been replaced with a horizontal plasma -- the bottom line of the "shen" symbol. Jupiter thus had shrunk to a much smaller size already 200 years before Mars stopped coming.

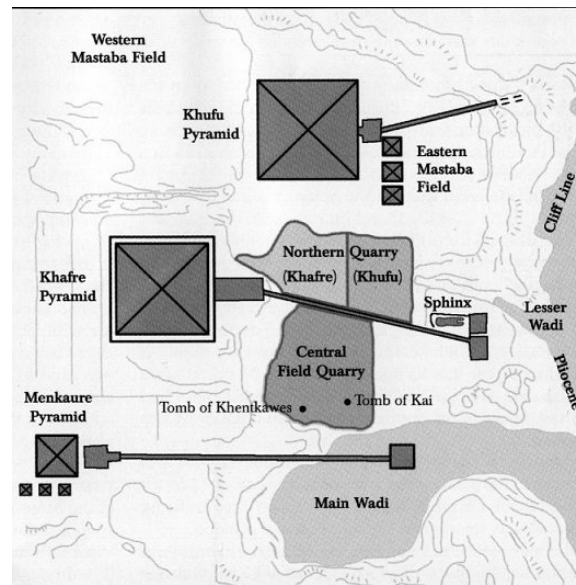

[Image: Pyramid of Djoser, circa 2655 BC. Public domain.]

Two (three?) additional step-pyramids are constructed before Seneferu (4th dynasty, circa 2613 -- 2589 BC) builds the first true pyramids, one at Meidum and two at Dahshur. The three Seneferu pyramids together exceed the immediately following pyramids of Giza in volume.

Seneferu's direct successors build the three pyramids at the plateau of Giza (between circa 2590 and 2500 BC). This was the largest single construction project ever undertaken in the world, and reflects the extraordinary efforts by the pharaohs to restore previous conditions. The Giza pyramids have fascinated visitors for over 4500 years. The location at the apex of the Nile delta, the surrounding level plateau raised above the countryside with the river sliding past below, and the rectilinear placement of the three pyramids, together are a major

design feat. The location and design speak of uncommon power and majesty, reiterated by the sheer size of the structures.

[Image: Giza pyramids. After Colin Reader.]

The Giza pyramids are cenotaphs, that is, empty "fake" graves, and it is absolutely amazing to consider the astounding amount of effort which went into graves which were meant to remain empty from the first moment of their design. We need to look for a significance beyond the simple political pressure to have separate graves for the pharaohs in Upper Egypt and Lower Egypt. [\[note 20\]](#)

The size of the three Giza pyramids and their relationship to each other have caused no end of speculation. Newton awaited measurements of the base of the main pyramid before publication of his theory of gravity -- on the assumption that the base would be a significant fraction of the Earth's diameter. This was based on a belief in "the wisdom of the ancients," still current in the 17th century AD. A contemporary theory equates the three pyramids with the three stars in the belt of Orion. Aside from the fact that Orion has no relationship to anything in Egypt, they do not correspond in placement. A more reasonable recent suggestion has been that they represent (in order) the planets Earth, Venus, and Mars. This was then "proven" with inscribed circles, sight lines, and various geometrical manipulations. [\[note 21\]](#)

I think that the pyramids most likely represent, in order from north to south, the graves of Ra (or Amun), Osiris, and Horus. That is, the planet Saturn as originally seen at the North Pole, Jupiter as Osiris the son of Ra seen as the green mantled form which was understood as the mummified God receding into the south skies, and Mars as Horus, the reincarnated Osiris.

Horus (Mars) had failed to return after about 2750 BC. Dead also was the original deity at the polar location, Saturn. Osiris (Jupiter) had also long been dead. Perhaps it was enough to have these planets appear in the south as pinpoints of light at best to be considered dead.

At the time of the construction of the Giza pyramids Jupiter was seen again in the night skies of the south, however. The pharaohs of the fourth dynasty added "Son of Ra" to their long names, for Jupiter had moved out of the asteroid belt after 350 years (circa 2590 BC, at the start of the building efforts) and again had a large lower plasma outpouring.

Isis was not represented with a grave, for the planet Venus clearly still stood in the skies at that time. The first two pyramids were faced in brilliant white limestone. The third pyramid is smaller and has the lower half faced in very roughly cut unpolished red granite -- all three appropriate for Saturn as Ra, Jupiter as Osiris, and the red planet Mars as Horus, even to the point of duplicating the roughly cratered southern hemisphere of Mars. [\[note 22\]](#)

[Image: Section through the pyramid of Khufu (Cheops) at Giza. After I. E. S. Edwards.]

These pyramids are religious concepts about the death of the Gods expressed visually and brought within the provisional responsibility of mankind. Egypt was providing the graves for the dead Gods.

The pyramids are staggered because each had to face north. The second pyramid is smaller than the first, but sits on a rise in the plateau, making it nearly the same height as the first, appropriate for Osiris as the son of Ra. The third pyramid is considerably smaller. This is the new youth, Horus, as the resurrected Osiris. The addition of a gold plated cap to the first pyramid, which archaeologists presumed existed, would likewise be befitting to the earlier fiery condition of Ra after Saturn went nova.

The whole of the elaborate grand passage rising within the Great Pyramid (Khufu's), rising at a slope of 26 degrees, and never duplicated in any other pyramid, represents (I believe) the plasma stream connection, with the multiple roofs above the "King's Chamber" (at the top level) reproducing Saturn and the upper rings surrounding it. The upper chamber and the

sarcophagus are of red granite duplicating the later looks of Saturn. The symbolism of the lower "Queen's Chamber" likely was meant to represent Mercury in its location below Saturn.

[Image: Unloaded roof beam slabs above Khufu's burial chamber. Anthony Sakovich writes "the arrows point to the spaces: This area of 'non-contact' is precisely what we need to show that the force is being totally and completely transferred away from the roof of the King's burial chamber ... and also right over the top of the Grand Gallery."]

The multiple roof beams of granite blocks above the upper "King's Chamber" have no structural advantage, despite the fact that this "reason" has been repeatedly recopied from one source to another. The weight supposedly resting on the upper "King's Chamber" (200 feet of stone) is much less than the weight bearing on the much lower "Queen's Chamber" (300 feet of stone) which uses only a single set of peaked slabs for its roof (thus shaped like a house roof). The use of peaked or corbeled roofs had been in use in the pyramid at Meidum, and in the two pyramids by Seneferu at Dashur (each supporting 300 to 400 feet of stone above the roof).

Structurally, peaked slabs or a corbeled roof would have made much more sense for the King's chamber. In fact, above the five flat blocks of the "King's Chamber" is a set of peaked slabs, structurally unconnected to the flat slabs below them. [\[note 23\]](#)

Thus all the construction at the Giza plateau comes together in the final product, based on an initial grand design, and not as three pharaohs competing for national resources and building progressively smaller pyramids as the original impetus faded over the course of 80 years. [\[note 24\]](#)

Colin Reader has suggested that the construction of the three Giza pyramids show a design which encompasses all three pyramids from the very start.

"Under the conventional chronological scheme 'Khafre's causeway' [leading to the second pyramid] did not exist at the time of Khufu's [Cheops] quarrying [for the first pyramid]. If this had been the case, why was the extent of the quarrying limited by a feature (the causeway) which was only conceived in Khafre's reign?"

"The conventional sequence of development requires us to accept that Khufu's workmen went to the trouble of opening up a second quarry, leaving an intact limestone ridge -- which we now know as Khafre's causeway -- between the two quarries. Why did they not simply extend the northern quarry southwards by removing the linear body of limestone which, at the time, served no apparent purpose?"

"The positioning of the two quarries clearly suggests that, like the excavation of the Sphinx and the construction of the Sphinx Temple, the alignment of 'Khafre's causeway' was established some time before Khufu's work at Giza. Under this revised sequence of development, interpretation of the spatial relationship between the causeway and Khufu's quarries becomes quite straightforward, with the existing causeway limiting the extent of the later quarrying work."

-- Colin Reader, "Giza Before the Fourth Dynasty" *JACF* (2002)

This may be the only hint at a complete plan, outside of the final results. The Giza pyramids are the only grouping of graves in Egypt with a unitary design. Reader also suggests that the Sphinx may date from the first or second dynasty, that is, it preexisted the building of Khafre's causeway and his mortuary temple. In fact, the walls of the mortuary temple of Khafre are wedged into the enclosing wall of the Sphinx temple. There is additional evidence also.

He suggests dating the Sphinx construction to the first or second dynasty. I would suggest a date after the start of the second dynasty, because this was the time directly after Jupiter, as the Midnight Sun, disappeared from view. In about 2859 BC Jupiter entered the main region of the asteroid belt (at about 2 AU) and its size and coma were reduced significantly. The first dynasty ended in 2890 BC.

This suggests that it was not a civil crisis or political developments which caused the change of dynasties, but a religious crisis. This will be seen over and over again, except for the much later period of the New Kingdom, and even for this later period we have established religious crises. [\[note 25\]](#)

The only reason to have the Sphinx facing directly east is in relation to the Sun. This would make sense if Giza represented the northernmost travel of the Sun -- that is, its solstitial latitude. Giza had already been a cemetery during the first and second dynasty, and perhaps

for the same reasons.

Thus it is possible to suggest that the Sphinx was constructed to face the rising Sun at solstice, when the current real Sun replaced Jupiter after 2860 BC. That calls for a summer solstice sunrise at 30 degrees north latitude, the location of the Giza pyramids and the Sphinx. But that would happen only if the inclination of the Earth's axis was 25 or 26 degrees. Assuming the disappearance of Jupiter as the Midnight Sun near the end of the first dynasty (and its visual shrinkage), it could be suggested that the Sphinx was constructed after the end of the first dynasty as a beacon to watch for Ra's (Jupiter) return. Since this is the maximum northerly displacement of the ecliptic from the equator, it is also the maximum northerly location of the rising of any of the planets, and especially a slow moving planet.

If the inclination was 25 or 26 degrees, so that the Sun would rise directly east at Giza at the solstice, then the equinoxial path, where the Sun traveled from east to west on a path directly overhead, would have been experienced at 25 or 26 degrees north latitude, at Nekhen (Hierakonpolis) (at 25 degrees north latitude). Nekhen was the primary "religious and political capital of Upper Egypt at the end of the Predynastic period (c. 3200-3100 BC) and probably also during the Early Dynastic Period," reads Wikipedia.

The significance of the giant Giza pyramids is now easy to understand. The Gods of old now lie in state in Egypt at the apex of the Nile delta, the very entrance to Upper Egypt -- as determined by the travels of the Sun. Upper Egypt had become the home of the dead Gods. This should not be seen as a symbolic representation. These structures were intended as the actual graves for the actual Gods. Nothing less could be so important. [\[note 26\]](#)

The pharaohs after Khufu added "Re" to their names. At that time Re, as Jupiter, was blazing again as the Midnight Sun after a 300-year absence. Jupiter had exited from the asteroid belt in circa 2527 BC and again stood in the night skies with a coma three times the size of the Moon and a gigantic plasma mountain. It had happened shortly before Khufu took the throne. All subsequent pharaohs use "Re" or "son of Re" as part of their name also. This may have been understood as another religious crisis for Egypt. But as likely it would look like the ghost or reincarnation of Re was giving his blessing to the construction efforts.

[Silbury hill rises out of the landscape south and in view of Avebury henge. The hill has no content except a small dedicatory offering at the center at the bottom. After sacredsites.com.]

South of Giza are the three earlier attempts at giant pyramids at Meidum and Dahshur (60 and 30 miles, 100 and 50 km, south of Giza). These were started in 2600 BC by Seneferu -- thus at about the time Jupiter exited from the asteroid belt and again assumed its gigantic mountain form. Seneferu's pyramids in aggregate exceed the Giza pyramids in size. It is interesting that here we also have three pyramids -- all constructed by a single pharaoh, the father of Khufu. These are the first true pyramids (as opposed to two earlier step-pyramids) and all three look like experiments in building techniques culminating in a final design at Giza. As at Giza, the Seneferu pyramids also represent two large and one smaller pyramid. The supporting ground surface at Meidum and the construction methods and materials caused major faults and the partial collapse of one. They certainly do not match the majesty of the group at Giza. [\[note 27\]](#)

The start of pyramids after 2600 BC in Egypt is duplicated elsewhere in the world -- in China (undated), in the Andes on the Peruvian coast (2630 BC), in Greece, and in Mesopotamia as high ziggurats (uncertain dates, but 2600 BC or later).

Silbury Hill near Avebury in England is interesting. It is the largest man-made hill of antiquity -- composed entirely of chalk with a sod covering, and without monuments or burials. It is 120 feet (40 meters) high, 520 feet (175 meter) wide at the base and surrounded with a ditch 20 feet (7 meters) deep. It looks like a somewhat later effort at inducing the return of Mars. Silbury hill was started in 2750 BC (the initial mound), with the third phase of construction completed in 2500 BC. (I have another starting date of 2660 BC.)

Expectations of the return of the Gods last for thousands of years. The much later 300-foot-high temple of Marduk at Babylon (built prior to 1800 BC, expanded in circa 700 BC, rebuilt in 680 BC) was called "Etemenanki" which transliterates as "The Temple [House] of the Receiving Platform between Heaven and Earth" (Jaynes). The living quarters of the God had been replaced with a landing pad.

A constant in all the construction (especially later in Mesoamerica) is the need to periodically enlarge existing monuments or build new ones, like Horus had rebuilt his mountain 10 times, and to be always ready for the next coming of the God, who never again appeared after 2700 BC -- at least not for some 1100 years.

Barrows after 3100 BC

After about 3000 BC the barrows and henges of Western Europe seem to take on a new meaning among the coastal tribes of Brittany, England, and Ireland. The barrows and henges start proliferating again, with concentrations in Brittany and England completely out of proportion to any need for interments or meeting places. As an extreme example, there are single village locations in Brittany with hundreds of barrows.

As I have pointed out before, it may be an error to call these constructions "grave barrows." None of the early examples seem to have had anything to do with the dead. Only after 3000 BC are some converted to ossuaries. Even most of the late barrows are seldom used for interments.

The barrows, especially, are associated with a people who are thought to be newcomers to the region, as is demonstrated by new forms of pottery and tools which show up. The coastal lands had been scoured clear of life with the flood of 3147 BC, but repopulated within the next hundred years. The extant barrows, henges, and causeways must have been an amazing sight. These gigantic structures, some of which had already been in place for thousands of years, would certainly have represented an ancient order of power to the new tribes who had recently migrated into the region. I suspect that new constructions soon became the expression of status and power among individual clans.

Certainly the repeated overflights by Mars after 3000 BC must have been reason enough to reactivate the monuments which had stood idle for over a hundred years and to build new ones. And perhaps those earlier regular visits of Mars were also seen as conferring authority on the local clan chiefs, similar to what occurred in Mesopotamia and Egypt during this period.

What we are certainly seeing after 3000 BC is the ability of leaders and chiefs to muster greater resources to accomplish the additional new constructions. This might be the result of an increase in population density due to a more settled way of life based on farming rather than hunting.

Seen as part of the aggrandizement of individual clans and their leaders, the profusion of these later barrows is more easily explained, even if there were also overt religious purposes. This would explain the later fake burrows which have a doorway but no interior. There was a shifting in alignments also, from a west-north-west direction (the earlier orientations to the strike point of the plasma) to a north-south direction (the center of the movements of Mars on his visits, and the center of the rotating sky).

I would not suggest such mundane motives for these constructions were it not for the documented experience at Easter Island. Easter Islanders did not stop carving the 800 giant statues of their ancestors until they had cut down the last tree needed to move the statues. Nearly 400 were never completed or placed as a result. In Easter Island the "form" remained fixed, like the form of the barrows and henges. [\[note 28\]](#)

There are many other examples of this type of compulsive and repetitive construction. The Yucatan Maya stelae come to mind, as do the temple pyramids which start to appear in Mesoamerican villages with great frequency. Other examples are the mounds of the Ohio Hopewell culture and the gothic cathedral craze of 12th-century Western Europe.

In some of these examples, the evidence for religious motivation is more obvious. Henry Adams attributes the construction of the gothic cathedrals to a desperate longing for hope in the face of a repressive religious atmosphere. Religious motives, like the guarantee of a leader's intercession with the Gods, were very likely the reason behind any of these obsessive constructions of the past which became region-wide cult practices. If religiously based, the design for the construction would have been mandated by sacred forms, which would have remained inviolate even if their original purposes were forgotten. The empty barrows and the passage graves, where the side rooms are no longer in pairs, both seem to be examples where the form has been retained after the original vision had been lost. [\[note 29\]](#)

Religious motivation most certainly underlies the building of barrows also. It is possible that the Celts of this time period considered the barrows as a means of transport to the land -- paradise -- which had stood in the sky overhead only a few hundred years earlier, or as a way of warding off the capricious Gods. These late barrows were constructed during the 300-year period when Mars (Horus of the Egyptians) regularly overflowed the Earth. [\[note 30\]](#)

New henges were built after 3000 BC also, up to maybe as late as 2300 BC. Many of the 100 henges of England are wood henges, all built after 3000 BC, involving hundreds of tree trunks, often replaced by standing stones at a later date. The circular form is retained and often expanded to many concentric circles.

Henges after 3000 BC

I should highlight the giant Avebury henge, one of the largest in the world, which was started soon after 3000 BC (other dating suggests 2600 BC), and is located directly north of Silbury

hill. Avebury henge clearly represented Saturn, complete with a causeway extending southeast (with a number of bends) and ending in a much smaller henge, known today as the "Sanctuary." The Sanctuary is reminiscent of the Egyptian valley temples (the mortuary) located at the southeast end of a pyramid's causeway. [\[note 31\]](#)

If the purpose of the original henges was to imitate, commemorate, or ward off the plasma column seen above the Earth, then, in the absence of the plasma stream after 3100 BC, a new purpose has to be assumed for their continued construction. It would not be unrealistic to assume a religious purpose. These new constructions, in effect, are temples, although not in the manner of the Eastern Mediterranean, where temples are understood as a "house" of the God.

Stonehenge might serve as an example of how the basic form is retained even if many aspects of the earlier design are changed or neglected. Stonehenge is the most studied henge of antiquity. It is also anomalous in being unlike the earlier forms of henges and in that no other henge had as much time and effort dedicated to it -- 1500 years of remodeling.

[\[note 32\]](#)

In the final design, Stonehenge is aligned (it is thought) to the midsummer sunrise -- the current summer solstice, although it is off by 3 degrees. And it did not align with the solstice of 4000 years ago either. I also seriously doubt if Stonehenge was ever intended as a celestial observatory for determining aspects of the calendar, especially for agricultural use, as others have claimed. That is just a stupid notion. Farmers know when the soil is ready for planting and don't use calendars. They also do not need to be notified of eclipses and, even less, to know the location of stars. Neither of these have anything to do with plantings or harvests. The only thing that makes sense is for the site to have been used in religious festivals.

[Image: Stonehenge, looking southwest. After sciencenews.org.]

But the obsession of the British with assigning astronomical features to Stonehenge, as also to many other megalithic monuments, is the direct result of the astounding advances made in astronomy in the late 1700s and early 1800s, especially in England, and specifically by William Herschel and Caroline Herschel. If this had been another era, other uses would have been ascribed to the megalithic monuments.

The earliest structure built at Stonehenge, dating from before 2900 BC (some claim 3100 BC), was a circle of 56 postholes (for wooden posts) with a surrounding ditch and embankment. The original 56 "postholes" are three feet (a meter) in diameter. These are not posts, these are holes for the trunks of full sized mature trees. It was thought at one time that these "postholes" might have contained the blue stones, rather than wooden posts. This would make much more sense for an initial structure.

[Image: Stonehenge. After sciencenews.org.]

The embankment was built inside the ditch. Every previous henge has the bank located outside the ditch. This already suggests a disconnection of the first builders from earlier forms and purposes, and suggests a late start. At this time there was also no causeway. The 56 posts were removed and the holes were backfilled with chalk (which is what the subsurface at Stonehenge consists of) in 2400 BC, when the stone construction started. Eighty "blue stone" blocks were transported from 250 miles (400 km) away, each weighing up to 4 tons. The blocks are not all from the same source.

The construction was then delayed 200 years (after 2350 BC), and taken up again (involving additional remodeling) about 2100 BC, when most of the blue stone blocks were removed and replaced by much larger local sandstone blocks (weighing up to 50 tons). There was additional remodeling in about 1600 BC. The bluestones were apparently moved to a woodhenge (called Bluehenge), the terminal of the road leading out of Stonehenge, and

located on the river Avon. After 1500 BC all construction activity had stopped at Stonehenge.

Stonehenge is the only henge using capped stones. This is the most impressive feature of the site (plus the size of the stones). The ring of capped stones was constructed with the later larger stones. These large stones were dressed, which has suggested a Mediterranean influence to some, but stones used for other projects in the same region were roughly dressed or carved as much as 2000 years earlier -- long before the first use of dressed stone construction in the Eastern Mediterranean region. Stonehenge had a causeway added during one of the late reworkings of the site when 19 of the blue stones were also returned or repositioned.

Stonehenge kept the form alive for thousands of years, but the ideas were fractured. It is too small of a circle compared to earlier henges. The bank was built on the wrong side of the ditch. The ditch was never seriously excavated; it is shallow, and debris, left behind in the ditch, marks it as not being considered a serious part of the structure. The causeway was added late and, while the causeways of all earlier henges are on the southeast side of the circles, the causeway of Stonehenge leads off from the northeast opening in the circle. Appropriately, it includes a bend (actually, two bends) in the path. The idea is there, but the assembly instructions are a little muddled. The causeway actually runs east for a much longer distance, then turns southeast to meet the Avon river. The effect is to suggest a processional, rather than a design to point to the midsummer sunrise. At the end of the causeway (at the river Avon) was a smaller henge ("Bluehenge") where the bluestones were at one time located.

In the end, after 2000 years of changes, Stonehenge might have functioned as a monument to the Sun -- but, over its long period of use, the dedication changes from the creator Sun, Saturn, to the Midnight Sun, Jupiter, and eventually to our current Sun, but not until after 685 BC. More on those topics in a later chapter. Since more and more interments are being found nearby, it is currently suggested that Stonehenge was simply a temple dedicated to the dead. That is the first sound idea in 300 years of archaeological considerations and speculations.

Endnotes

Note 1 --

The same intense agricultural practice appears in China, the Andes, Mesoamerica, Southeast Asia, and West Africa -- all at about the same time. It might be simplistic to note, but it was likely that in all of these cases it was the farmers who first recovered from the flood disaster of 3147 BC. Farming became the core for any further development of civilization and population expansion. About the sudden rise of these farming communities, William Mullen in 1994 noted:

"What these civilizations are all simultaneously emerging from, will ... be the largest question before historians of early mankind."

-- William Mullen "Cenocatastrophysm" *Kronia Symposium* (1994)

There are problems with the statement "the graves of kings." Egyptian graves are identified by labels on grave goods, and it is assumed that the names on the labels correspond to kings with the same names (almost not a single body and very few goods have survived grave robbery in antiquity). Mesopotamian "royal" graves, as, for example, those excavated by Sir Leonard Woolley at Ur in 1928-29, have no identification with known names from the Sumerian *King List*. H. W. E. Saggs, in *Babylonians* (2000), writes:

"The richness of the contents of the tombs led Woolley to conclude that they were royal. This assumption received a degree of support from names inscribed on some of the objects, a few of which can be linked to kings of Ur of the Early Dynastic period [a broad range of 2900 - 2371 BC]. No burial, however, is directly identified with a royal name, and in one case the name of a known king occurs in the burial chamber of a female corpse. It is therefore possible that the royal names did not identify the persons buried but were there because royal persons had made dedications at some ritual vital to Ur."

Gunner Heinsohn, at the 2009 Conference on Quantavolution (Kandersteg, Switzerland), presented a paper on "The Scythian Kurgans and the 'Royal Tombs of Ur'," which convincingly identifies the "Royal Tombs" as kurgans of the 8th and 7th century BC.

So where are the kings of Ur buried? I would assume that there existed leaders and priests of Ur, but that the "kings" of the *King List* were celestial. This probably holds for Egypt also.

[\[return to text\]](#)

Note 2 --

To have Horus (Mars) first appear in circa 3067 BC, that is, to take the Egyptian *Contending of Horus and Seth* at face value, resolves a number of discrepancies in the list of the Kings of Kish, and matches the better dated archaeological records for the first dynasty of Egypt. See Appendix A, "Chronology Notes."

[\[return to text\]](#)

Note 3 --

The Egyptians recognized that Mars had been seen before, and distinguish this incarnation from the previous appearances of Mars, before 3147 BC, by calling the previous Mars "Horus of the gods" or "this first Horus." The Maya *Chilam Balam* makes exactly the same distinction.

I have to point out that Jupiter (Osiris) with his erect penis was probably remembered as if it happened yesterday by a people who could not place events in perspective in the past, except as rather meaningless narrative sequences.

[\[return to text\]](#)

Note 4 --

When pyramids start to be built, they are uniformly squat structures -- throughout the world. If these had been meant to represent the "mountain" seen underneath Jupiter, they would have been very steep. Jupiter dropped its steep mountain shape in about 2860, some 100 years before Mars no longer appeared near Earth. In fact, when Jupiter exits the asteroid belt in about 2550 BC and assumes a "mountain" shape again, steep pyramidal structures start to be built in Egypt. This happened during the initial years of the 5th Egyptian dynasty.

[\[return to text\]](#)

Note 5 --

The mastabas and first few pyramids of Egypt continue to face northwest until shortly before the construction at Giza. With the pyramids of Seneferu and Giza (constructed after Mars no longer visited Earth), and all the following pyramids constructed over the next thousand years, every structure is aligned with the geographic north. The exception was a period late during the 5th dynasty, when Egypt experienced another religious crisis, and a few pyramids were built with their long axis aligned northeast to southwest, perhaps reflecting the supposed location of the Underworld -- the location to which the door on the Duat would move every day, or the location of the older southern plasmoids.

Amazingly, the rectangular plan, the rise at about 60 degrees, the alignment with the north-south Earth axis, and the dates of the start of construction, are almost universally identical throughout the world. There are very few exceptions.

[\[return to text\]](#)

Note 6 --

David Talbott had difficulty explaining the iconography of a mountain, for he assumed the moving mountain to be part of the original display caused by Saturn during the "Era of the Gods." But it is not. Removed from the image in the sky before 3147 BC, and assigned to the 300-year period of the visits by Horus after 3067 BC, it is easily explained.

The cone of plasma extending to Mars could be seen with ease from below the equator and, in effect, becomes some of the first definitive celestial displays for people living in these regions (besides the view of the collapse of the Saturnian system in 3147 BC).

This can be verified from the earliest iconography of South America. One instance is the image of the "Staff God" which appears early in Peru. It consists of a globe-like face (or

body) which carries a staff in each hand, held vertically. The two staffs are likely the edges of the conical plasma stream to Mars, where it appeared most dense. The Staff God was originally female. The image of this apparition as a God will be reinforced with the later appearances of Mars in the 8th and 7th century BC. Although most of the images of the Staff God are dated to 500 BC, a version has been found on a gourd dated to circa 2200 BC, at Norte Chico in Peru.

The Staff God is also known as the Smiling God, as opposed to more ferocious looking deities, with a round face, short body, and snakes for its hair, belt, skirt, and anklets. But in this form it more likely represents the "happy face" seen in the southern ball plasmoid after 10,900 BC. South of the obscuring equatorial rings, people would have had an unobstructed view of this. In this case the two staffs, which vary from condor-headed spear throwers (Tiwanaku) to shorter objects like beakers, may be an abbreviated version of the overhead lines of electrons, just as the single face is doing duty for three ball plasmoids. And he is also known as the Thunder God (probably meaning lightning) like the names of the southern gods in the *Popol Vuh*.

Egyptian images also show the pharaoh with two staffs, but these are today thought to represent the two kingdoms: the shepherd's crook of Upper Egypt, the grain flail of the delta. I am more inclined to have the crook stand for "time," as it also does duty as the year glyph, representing the plasma plume rising from one or both poles. The pharaoh was expected to live an afterlife of millions of years. He owned time.

The flail, which appears early in depictions of the Sed festival, is likely related to the brooms and sweepers noted by other people as moving along the overhead electron beams after 10,900 BC.

The identities of the Gods shift over time, and especially during the confusion of the end of the "Era of the Gods" in 3147 BC. Before 3147 BC, to the Egyptians, Saturn was Ra ("the Sun"). After 3147 BC, Saturn might first have been identified as Osiris, and Jupiter at first as Seth, and later as Osiris, to eventually be known as Ra or Re ("the Sun").

Late in the "Era of the Gods" Venus was possibly already identified as Isis. But after 3147 BC Lower Egypt calls her Neith, which is actually the well-established southern plasmoid of an earlier time, and only later as Isis. Hathor seems to be a southern version of Isis, but with differing qualities. And then there is Nephtys, who might be the sister of Isis, or be Isis herself.

Mars returns as Horus. "Horus" is the title of any leading God also. After circa 2600 BC Jupiter will become the main God, as the Midnight Sun, and be called Re ("the Sun"). His worship may have been instituted in Heliopolis (the city of On) soon after 3100 BC.

The first extensive "pyramid texts" date from 2345 BC. There are earlier snippets of casket markings. The main concern of the pyramid texts is to establish the worship of Osiris.

The pharaohs which we only know by Horus names extend only to about 2680 BC, through the First and Second Dynasty.

[\[return to text\]](#)

Note 7 --

The frequency is based on the synodic period of the orbits of Earth and Mars, which will be developed later in this chapter.

It can be assumed that the apsidal precession of the orbits of the inner planets was much greater (happened sooner) at a time where minor gravitational effects had not yet aligned the orbits into a resonant pattern which slowed the apsidal precessional rates to their current periods -- about 112,000 years for Earth, 43,000 years for Mars. See Appendix B, "Celestial Mechanics."

[\[return to text\]](#)

Note 8 --

Donald W. Patten and Samuel R. Windsor, in *The Mars-Earth Wars* (1996), have suggested a 720-day orbital period for Mars (at the time when the Earth's year was 360 days). I have verified the 720-day orbital period of Mars from some very arcane information among Maya calendar measures. See the chapter "The Maya Calendar." But additionally, the use of a 720-day orbital period has worked correctly when applied to different situations over a 3000 year time span. It can be assumed that the period of Mars after 3100 BC remained the same until 747 BC, and perhaps even later.

A 720-day orbital period for Mars places Mars and Earth (for an Earth orbital period of 240 days) in a 3:1 relationship. The synodical period of Mars would be (using a 240-day year): $(720 * 240) / (720 - 240) = 360 \text{ days}$. Mars would show up near Earth every $720 / (720 - 240) = 1.5 \text{ years}$.

Patten details how he arrived at the 720-day period for Mars with the help of Ronald Hatch, in "The 108-year Cyclicity of the Ancient Catastrophes," in *Aeon* (1990).

[\[return to text\]](#)

Note 9 --

This assumes an orbit for Mars with perihelion close to the Sun, and a crossing of Earth's orbit at somewhat of an obtuse angle. If that was the case, then the apparent rotation of Mars around the pole would only be seen for a day or so, since the orbital speed of Mars would increase after crossing Earth's orbit, and chances are that the planet would be lost from sight as the Earth fell behind in its orbital travel.

[\[return to text\]](#)

Note 10 --

The Sed festival may have celebrated an investiture of the pharaoh in the manner of the approach of Mars (Horus) with Earth, or it could have reflected a vastly more ancient tradition. In another chapter I have proposed that the Sed festival may date to the era of the southern ball plasmoid. Although there are Egyptian references to the effect that the festival was held at 30-year intervals (which would seem to relate to the return visits of Mars), nothing indicates that this was strictly observed.

[\[return to text\]](#)

Note 11 --

The Sumerian *King List* for the Kings of Kish seems to record both the travel of Mars and the sightings of Mercury, separated by 10 to 15 years. The period from one visit by Mars to the next varies between 35 and 25 years. See Appendix A, "Chronology," for details.

The indeterminate reigns of the pharaohs of the First and Second Dynasties of Egypt, which include very long reigns and very short reigns, and includes pharaohs only known by a very few inscriptions of serekhs (name tags), may reflect a similar process of naming chief priests or leaders after appearances of these two planets. The two dynasties extend over the same time span as the kings of Kish, and include some 17 to 20 pharaohs, similar to the number of kings in Kish.

It is clear from later records that Mercury becomes prominent in the skies at some interval measured in a thousand years. This could be suggested from the fact that "Mercury" becomes a popular personal name at various times. This last happened in the 8th and 7th century BC. Because there is an interaction of Mercury with Earth in 686 BC, I believe that until then Mercury remained on an orbit reaching far past the Earth's orbit to the edge of the asteroid belt, just like Mars.

[\[return to text\]](#)

Note 12 --

Although I have already proposed that the asteroids in the company of Mars could have been extracted from the edge of the asteroid belt, it remains mostly unexplained how this was accomplished. The cloud of debris could have preexisted, but it would be highly improbable that Mars would have gone into orbit at the center (or even near) such a cloud of rock fragments. Only Tom Van Flandern's suggestion of a gravitational sphere of influence for planets makes sense here.

Except for Followers of Horus (Mars), of which six have been found to date, the "cattle" seem to have disappeared, or just cannot be seen today. Patten and Windsor in *The Mars-Earth Wars* (1996) also suggest that the orbit of Mars would have to extend into the asteroid

belt, and thus the Followers of Horus were picked up as satellites.

To account for why Mars would have been expelled away from Saturn at the asteroid belt, it can easily be suggested that, on entering the asteroid belt, Saturn would have significantly reduced its coma, as we will see Jupiter clearly do also at a later date. That would have abandoned Mars and Mercury to the gravitational forces of the Sun, so that they would immediately have started on an orbit with the Sun as one of its centers (focus).

[\[return to text\]](#)

Note 13 --

Asteroids in the orbit of Jupiter, shown at an angle to the planetary orbits. Since these are rendered as dots, the asteroids look like they make up a considerable mass. This is not so, since the total mass of all the asteroids is less than three percent of the mass of our Moon. The clusters of asteroids preceding and following Jupiter (called the "Greeks" and "Trojans") are clearly seen to occupy a very wide section of interplanetary space. The same could be suggested for an asteroid cluster associated with Mars. The asteroid belt occupies a doughnut-shaped space in the Solar System, from about 2 AU to 3.5 AU.

[Image: Asteroids in the orbit of Jupiter. Illustration by J. Cook.]

[\[return to text\]](#)

Note 14 --

Not that there were not some actual battles or, more likely, skirmishes, especially after about 750 BC, which the Egyptians consistently lost -- to the Assyrians, the Persians, the Greeks.

"The visual depiction of Egypt's enemies and their role became so prevalent that it is difficult to distinguish in the archaeological and textual sources between purely ritualistic and rhetorical references to foreigners and genuine historical records. Repeatedly, we find examples of battles, and king's smiting enemies that in fact, did not

take place, but were mere copies of earlier scenes." --

[\[www.touregypt.net/featurestories/enemies.htm\]](http://www.touregypt.net/featurestories/enemies.htm)

[Image: predynastic ivory knife handle. The order of species depicted and their deportment, as with elephants standing on snakes (top of first knife handle), is almost invariant during this period, and thus largely formalized. After Francesco Raffaele.]

In Mesopotamia one of the fictional invaders seem to be the "Gutium hordes" which overran the Akkadian empire, although we have no clear dates or locations for the Gutium hordes, nor do we know where they came from, or what language they spoke.

[\[return to text\]](#)

Note 15 --

An earlier cosmetic palette, the "Two Dog Palette," shows a wild scattering of floating animals -- deer, antelope, cattle, giraffe, lion, a long-nosed jackal with human arms and legs, and a four-legged flying griffin, plus two large dogs. Only the dogs are matched left and right.

Another early palette, the partial "Vultures Palette," shows bound prisoners, birds, and dead men floating toward the right. A lion gnaws at a fallen prisoner while one human steps on the

neck of another. Interestingly, two of the four standards which are being carried before the pharaoh on the Palette of Narmer, and were thought to represent four of the nomes of lower Egypt, are here shown on a fragment, not carried, but with arms extending from the poles to hold the bound arms of two prisoners. Prisoners are identified by the fact that their elbows are tied together behind their backs.

Because these herds of animals (there are many engraved knife handles and combs totally littered with parades of animals) and prisoners occur before Horus first shows up, it would seem that the asteroid swarm (or some of these) were independent of Horus. This would account for the fact that the "cattle counts" are recorded separately from the passage of Horus. To have dead bodies (of humans) floating in the sky is reminiscent of the herds of dead animals depicted in Southwestern European caves.

[\[return to text\]](#)

Note 16 --

The earlier suggestion identifying Geb as the Peratt plasmoid of the south (see the chapter "Saturn and Archaeology") has additional consequences. Jane Sellers, in *The Death of Gods in Ancient Egypt* (1992), describes the Sed Festival of the Egyptians, from Ptolemaic sources (300 to 40 BC). Sellers writes:

"When the king reappears [after exiting from a chapel] he is wearing a kilt; in his right hand is the usual flail scepter and in his left is an object resembling a small Scroll. ... The king runs with this and displays it [the scroll] to all, proclaiming it was given to him by Osiris in the presence of the god Geb."

She adds a quotation from texts of the temple of Edfu (from Henri Frankfort, *Ancient Egyptian Religion*, 1948):

"I have run holding the Secret of the Two Partners [which is the name of the scroll]. The Will [another title] that my father has given me before Geb. I have passed through the land and touched the four sides of it. I traverse it as I desire."

"Touching the four sides" is suggestive of the "survey of the world" as related in the *Chilam Balam*, especially if this ceremony, almost inexplicably, involves the God Geb, who, as I have suggested, is likely to be the southern plasmoid. The institution of the Sed Festival would then date from remote antiquity. It might jokingly (or not) be suggested that the "Secret of the Two Partners," which is also called the "House Document," is a land deed. Who are the Two Partners?

The flail scepter is normally understood as a grain flail. A second matching scepter, which appears in association with the pharaohs at a later time, is the shepherd's crook. The obvious implication is that these are symbols representing the commerce of Upper and Lower Egypt, which were more or less divided into agriculture and animal husbandry. But it seems more

appropriate to the grandeur of a pharaoh if the flail was the sweeping device (the bramble bushes or heteromacs) for the overhead lines of blazing electrons of the Peratt polar column of 10,900 BC to 8347 BC, and that the crook is the polar plasma plume, which, although first seen in 3147 BC (as related by the sculptures at Palenque in the Yucatan), was not added until much later. The shepherd's crook is the symbol for "years," as in the phrase "Osiris of a million years," found in the *Book of the Dead*.

[\[return to text\]](#)

Note 17 --

The asteroids are located at 60 degrees in front of and behind Jupiter (an angle measured from the Sun) because at this location the forces due to the gravitational attraction of Jupiter and the Sun are balanced. Located anywhere else along Jupiter's orbit, the asteroids would be disturbed gravitationally, and move into an elliptical orbit away from the orbit of Jupiter. The stable orbital positions at 60 degrees apply to any planet.

[\[return to text\]](#)

Note 18 --

Despite the definitive statement by Millett, I still feel that it is more likely that the four standards represent the "trees" of the cardinal directions -- the polar and equatorial plasma plumes.

But since the fifth standard apparently appears after 2490 BC, it might be the appearance of Jupiter on a slimmed down lower plasma outpouring, and much longer than the earlier apparition. Jupiter at this time was much further away from Earth. The steeply peaked shape of the sun-temples recalls this shape also. The fifth standard was found carved at the base of a sun-temple. This fifth standard is thus likely entirely equivalent to the fifth directional tree of the *Chilam Balam*, which appears only once, and is associated with Jupiter as the "green tree of the center."

Additionally, it could be suggested that the city of Pe in the delta is actually Saturn above the North Pole before 3147 BC. Apparently Pe was occupied for 500 years in predynastic times, but was only a small village during the Old Kingdom and the Middle Kingdom, even though the Egyptians during these times referred to Pe as if it was still a major religious site and capital of the delta region. The inscription quoted by Millett is dated to early in the fifth dynasty, 2490 to 2445 BC.

[\[return to text\]](#)

Note 19 --

Apollodorus (AD 100) makes the ten labors of Hercules into 12 labors matched to the signs of the zodiac, starting with Leo. Note that all of the labors involve travel. Hercules is constantly on the move. This more likely represents the doings of Mars in the era of 806 BC

to 687 BC, when Mars made nine appearances.

Gilgamesh, in later renditions of the *Epic of Gilgamesh* (from Assurbanipal's library, thus before 612 BC), likewise travels through the signs of the zodiac in his adventures. But note that there are ten adventures originally, not nine.

[\[return to text\]](#)

Note 20 --

The mastaba graves of the Horus pharaohs of the first and second dynasty at Abydos are apparently cenotaphs (that is, empty graves), with the alternate (real) burials at Saqqara. Abydos was also the city of Osiris, and his "grave" became a site of pilgrimages in later antiquity. If then the graves at Abydos start with the grave of Osiris, followed by a dozen graves of Horus, it might be suggested that the Egyptians *pro forma* provided graves for the deity which the pharaoh represented (or, in their thinking, "was").

It is thought today that there was political pressure for two graves, because the pharaoh was King of Upper Egypt and Lower Egypt, and thus needed to be buried once in the south and once in the north. But this has the ring of an inappropriate imposition of contemporary political philosophy.

Despite the design of the Giza pyramids as cenotaphs, the queen and officials of the court of Khufu were all assigned graves at carefully placed locations (as mastabas) surrounding the pyramid of Khufu. The real grave of Khufu has not been located.

[\[return to text\]](#)

Note 21 --

On the placement of the pyramids in the manner of the stars in the belt of Orion, see Robert Bauval and Adrian Gilbert *The Orion Mystery* (1994). This is a good theory gone wrong. Orion has nothing to do with Egyptian religion, and basing a whole book on the alignment of one air shaft seems ludicrous. Additionally, as I have pointed out in another chapter, the sky has changed since the pyramids were built.

Here is a comment from J.A.R. Legon, originally one of the sources for Bauval and Gilbert:

"One of the generally accepted theories of modern Egyptology has been that the ancient Egyptians identified their god Osiris with the constellation of Orion. This association has become so widely recognized that it would seem futile to dispute the conventional view, and yet a detailed study of the Pyramid Texts and some other primary sources for ancient Egyptian astronomy casts considerable doubt over the validity of the interpretation, and suggests that the equation between Osiris and the constellation of Orion has been merely a convenient make-shift adopted by scholars owing to the lack of more precise information."

-- J.A.R. Legon, "The Orion Correlation and Air-Shaft Theories," *Discussions in Egyptology* Vol. 33 (1995), 45-56.

He continues:

"I have taken the view that his theory depends on a misunderstanding of the religious and funerary beliefs of the ancient Egyptians, as expressed in the Pyramid Texts of the Old Kingdom. There is, after all, no evidence from the Pyramid Texts or elsewhere to support the idea that the successive pyramids of the Fourth Dynasty were supposed to be equated with different stars of the constellation of Orion; and I find the idea conceptually implausible in view of the fact that the successive kings of the Old Kingdom each wished to be identified with 'S3h' -- Osiris -- in the afterlife, in precisely the same terms from one reign to the next."-- J.A.R. Legon, from his web page.

Additionally, as others have pointed out, for a hundred years before Giza and for four hundred years after, the ceilings of tombs were often decorated in nothing but rows on rows of star symbols, with a complete disinterest in the actual stars and constellations. Stars were only seen as so many twinkling pinpoints in the sky. Even in later ages, the Egyptians would reverse star maps at will to fit the decor of a tomb, and render constellations as they saw fit.

H. W. E. Saggs, in *Civilization before Greece and Rome* (1989), dismisses the astronomical acumen of the Egyptians, writing:

"In view of the low level of their mathematics, it is not surprising to find that the Egyptians made very little contribution to theoretical mathematical astronomy; as far as current evidence goes, they produced no texts which deserve this description until the final centuries before the Christian era, after they had become open to Babylonian and Hellenistic influences."

[\[return to text\]](#)

Note 22 --

The colors do not all add up. The second pyramid should have been green or red. Green was the color of Osiris before entering the asteroid belt, and red afterward (although the date for this is uncertain).

Part of the red granite of the pyramid of Menkaure has been dressed. But it should be pointed out that only the bottom 16 courses are red granite. The top courses are missing, suggesting that the construction was left incomplete.

The best theory on how the pyramids were constructed requires that the facing was precut (at an angle) and installed with each layer of stones. The slope of the facing would support ladder-like runways used for hauling blocks up the side of the pyramid.

[\[return to text\]](#)

Note 23 --

I would also argue against any idea of incorporating some grand mathematical constants, like *pi* or *phi*, despite what Herodotus was led to believe on the testimony of the priests of Sais. The mathematics of the Egyptians was crude at best. They never got *pi* (the ratio of a circle's diameter to its circumference) closer than about 3.2 -- with the use of a series of fractions. I used 22/7 in high school, which comes two orders closer to the correct value.

And what would the Egyptians use *phi* for? It has been suggested that the ratio of 1.6+ to 1 was used in architecture. *Phi* is approximated with the ratio of the long side to the short side of the 3-4-5 triangle. It is also the ratio of the orbital (as well as the synodic) periods of Earth and Venus (today, and possibly in the past). European thinking along the notion of "the wisdom of the Ancients" has, even in this century, held that the Egyptians felt the need to pass mathematical constants on to future generations, as if we couldn't figure that out.

The deviation of the angle of the slope among pyramids as well as the angle of the access shaft speaks to rule-of-thumb construction, not mathematical constants and certainly not dead-on surveying practice. It is not at all easy to get the initial angle correct. But once it is set, it is relatively easy to excavate and finish the boring visually in an absolutely straight line over hundreds of feet. The fine details of surveying seemed not to have bothered the Egyptians, for the angles of these borings vary quite a bit, even if the actual shafts are absolutely straight.

They certainly could do surveying, for taxation depended on knowing the area of the cultivated land, and they seemed to have used the fact that the diagonal of a square area can be used as the side of a larger square which will cover twice the area. And they certainly knew the 3-4-5 triangle -- which is still used today by carpenters to square up building foundations and set walls perpendicular to each other.

It looks, in fact, as if the 3-4-5 triangle was used in the design of the slope of the Giza pyramids (and one of Seneferu's pyramids at Dashur). The Giza pyramids have a cross section of two 3-4-5 triangles set back to back with the "3" side as the base. It would be easy for stonemasons to check accuracy, for if the "5" side is held against the slope, a plumb bob along the "4" side will determine the accuracy of the facing of the exterior blocks. Using the 3-4-5 triangle as the basis for design also makes the estimates for materials easier since all measures of materials are multiples of the sum of the three sides of the 3-4-5 triangle -- the base area, perimeter, volume, and area of the facing stone.

The angle between the "5" and "3" sides is 53.1 degrees. The slope of the Giza pyramids is measured or estimated variously from 51.3 degrees (Menkaure) to 53.2 degrees (Khafre). Perhaps an inverted isosceles triangle with a base of "4" and legs of "3" and a plumb bob (or a "2-3" triangle where "3" is the hypotenuse) was used at the Bent pyramid and the Stone pyramids at Dahshur to achieve the 43.5 (43.36 actual) degree angle.

The access shaft angle of 26.5 degrees is found from a slope of 2:1. This angle has nothing to do with the elevation of the polar axis above the horizon, which is 30 degrees at the latitude of Giza. All pyramids since Seneferu used this angle, or a measure close to it.

[\[return to text\]](#)

Note 24 --

Egypt's 3000-year repugnance for foreigners, and antipathy especially to the Asiatic nations, has to be rooted in the accomplishments of the Old Kingdom, especially the Giza pyramids. Egypt was the home of the dead Gods, and the pharaoh ruled upper and lower Egypt -- upper Heaven and lower Earth. The Sudanese were welcomed but not the Libians.

[\[return to text\]](#)

Note 25 --

I accept Velikovsky's suggestion of placing the monotheistic pharaoh Ahknaton in the ninth century BC (circa 850 BC). This will completely change the chronology of the New Kingdom.

[\[return to text\]](#)

Note 26 --

Kurt Mendelssohn, in *The Riddle Of The Pyramids* (1974), addressed the three pyramids built by Seneferu, concluding from available evidence that at least two were under construction at the same time, a conclusion which goes against the thinking of Egyptologists that individual pyramids were built one at a time by individual pharaohs. It affirms, however, the conclusion reached by Colin Reader that the three pyramids at Giza were planned as one unit. Mendelssohn writes:

"We have seen that the sudden decision to change the shape of the southern pyramid at Dahshur [the Bent pyramid] resulted from the catastrophe at Meidum. The disaster, as could be proved conclusively, took place in the middle of the third construction phase at Meidum. On the other hand, the pyramid at Dahshur had reached about half of its projected height when the angle of elevation had been changed. This means that roughly 70 percent of the masonry of the Bent pyramid had already been placed in position when the previous pyramid at Meidum was still under construction. The inescapable conclusion is that the building periods of these two pyramids overlapped very considerably."

Likewise, at [\[www.gizapyramid.com/ernest_moyer4.htm\]](http://www.gizapyramid.com/ernest_moyer4.htm), Ernest Moyers, in "Some Perspective on Pyramid Chronology" (2001), notes:

"... all four Great Pyramids [he includes the two pyramids at Dahshur] were part of one vast construction project. That project was carried on linearly until the last Great

pyramid was built, and could not have been associated in any way with reigning kings. If we are willing to swallow all the logistical and mechanical difficulties I outlined ... to make the construction cover 100 years of time according to traditional spans, then some person or some segment of the population was able to not only conceive of the project, but also to execute it. Either this meant that a continuity of concept was maintained between generations, with full knowledge of design and methods of execution, or the genius behind the design lived an extraordinarily long life."

[\[return to text\]](#)

Note 27 --

Seneferu's third pyramid is known as "the red pyramid." The core is a reddish limestone, although it was faced in white limestone from the Tura mountains on the east of the Nile. (Only the core shows today.) Thus originally it also had a white exterior.

The names of the two large pyramids are "The Southern Shining" and "The Shining," suggesting that, perhaps rather than built as trial versions of the Giza pyramids, these pyramids represent the three ball plasmoids of the south. No name has survived for the smaller third (red) pyramid.

[\[return to text\]](#)

Note 28 --

For the obsessive construction of giant statues on Easter Island, Jared Diamond suggests a number of requirements. Foremost is the existence of an egalitarian elite -- petty clan chiefs - - where no one person or group had overall power. It also suggests a division of the population into separate classes -- stone masons, farmers, and chiefs or priests -- and the additional requirement of a substantial economic base, like farming, to allow for feeding those who did not farm.

Some 800 statues exist; 350 were erected. All the rest were in a state of being carved or readied for transport. The whole project was abandoned at about the time that the last trees were cut down. Before erecting the statues became the obsession, the Easter Island natives built giant platforms at the edge of the sea, which are also found at nearby islands (1200 miles, 2000 km, away). There are prototypes for the statues on other islands also. See Jared Diamond, *Collapse* (2005).

Note 29 --

Henry Adams, *Mont Saint-Michel and Chartres* (1904).

[\[return to text\]](#)

Note 30 --

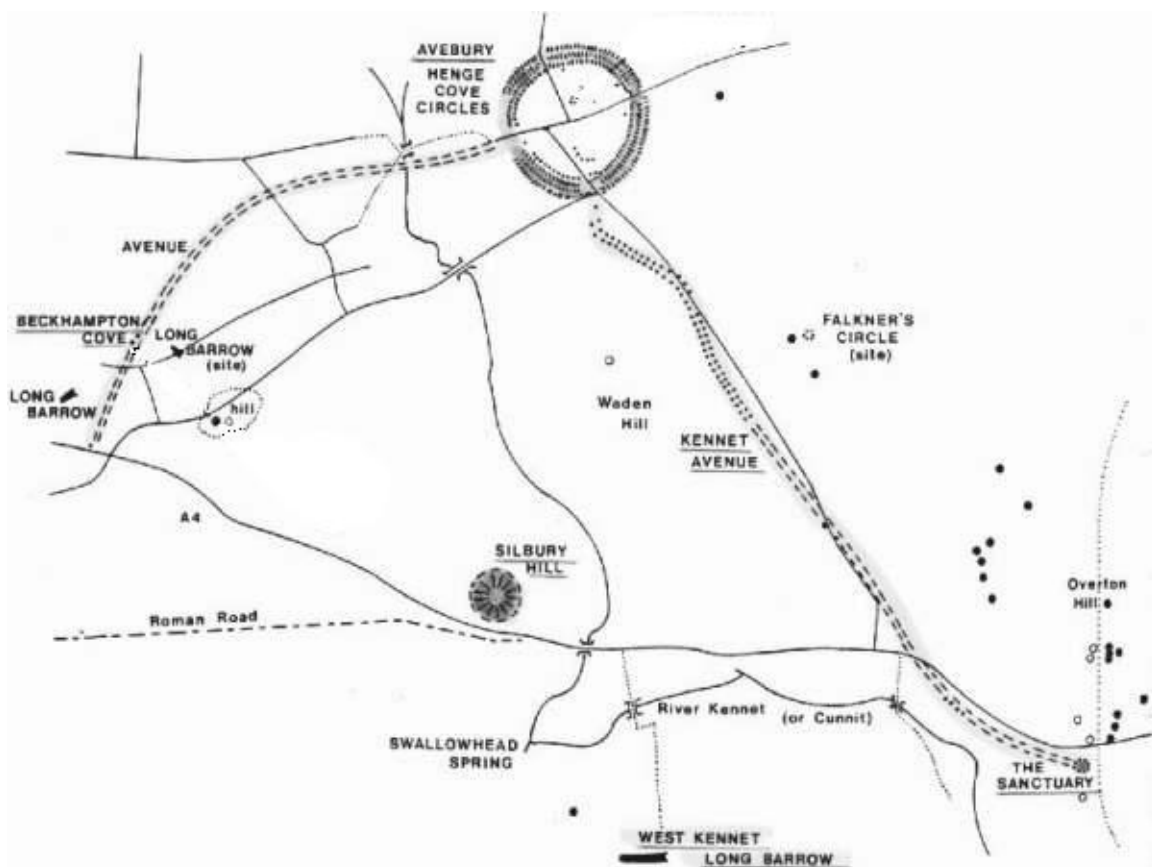

By Roman times the Celts of Western Europe firmly believe in metempsychosis, hundreds of years before anything resembling the concept of "life after death" was introduced by Christianity or its predecessor religions.

The Western Celts also clearly recall conditions of the "Era of the Gods" in the myths first recorded in medieval times (4500 years after the events). But, surprisingly, we hear nothing of barrows or henges in their recorded myths -- only tales of sacred springs and trees. Since they were very late invaders of Western Europe and the islands of England and Ireland, they had not witnessed most of the building and construction involved in the barrows, henges, and cursuses.

[\[return to text\]](#)

Note 31 --

The purposeful rebuilding of the post structure at the "Sanctuary" is noted in *British Archeology* (February 2000). It was rebuilt up to five times, not to enlarge the structure, but to replace it with a structure of the same dimensions. With each rebuilding the posts were removed and the holes backfilled, except the last time, in circa 2300 BC.

[Image: Avebury henge and causeways, Silbury hill, the Sanctuary. After stonehenge-avebury.net.]

There is a second causeway, of about equal length, leading off from the main circle toward the southwest. It ends in nothing but two unconnected long-barrows which were built in 3600 BC, used for a thousand years, and apparently backfilled and sealed during the construction of Avebury henge. The causeway to the southwest looks like a celestial path leading to the oval structures in the southwest skies. Note the 30-degree bend.

West Kennet Long Barrow is a chambered barrow and located directly south of Avebury, south of the Kennet river. It was started in about 3700 BC. East Kennet Long Barrow, a little further south, has not been excavated.

[\[return to text\]](#)

Note 32 --

The willingness of generations after 3000 BC to constantly remodel Stonehenge and keep its use current may be due to its limited size and central location.

The long history of constant reconstruction over the 1500-year period after 3147 BC might suggest that the building and rebuilding of the monument might have been the most important function of all, even though the actual meaning of this eludes us. This is not different from Mesoamerican monumental building practices.

Recovering the Lost World, A Saturnian Cosmology -- Jno Cook

Chapter 19: Midnight Sun.

\$Revision: 42.25 \$ (sun.php)

Contents of this chapter: [\[The Midnight Sun\]](#) [\[The Temple Cultures\]](#) [\[Something Is Missing\]](#) [\[Consciousness\]](#) [\[Bicameral Kingdoms\]](#) [\[The Flood of Noah\]](#) [\[A Second Strike\]](#) [\[Endnotes\]](#)

The Midnight Sun

This chapter will cover the 24th century BC: the advent of the midnight Sun, the temple cultures, and the event of 2349 BC which was misnamed "the flood of Noah" in the Bible. This is a popular chapter, for the flood of Noah would seem to everyone to explain all of the strangely destroyed and overturned landscape forms that we see. But actually it explains very little. Destruction of the landscape of Earth had been going on for millions of years. All the same, the flood of Noah is addressed below, after first establishing something of the social and political environment of the era.

The event of 2349 BC was probably the most impressive event ever -- and the most frightening. The next two chapters will expand on this and demonstrate that the "flood" never happened on Earth.

After the visits of Horus had ceased, and as the pyramids at Giza were under construction or shortly before (about 2600 BC), Jupiter again became the most spectacular object in the sky. The planet had at that time completed its movement through the main portion of the asteroid belt in receding from the Sun, and again developed a coma, as comets do today when changing their distance from the Sun. It sported a gigantic coma, much larger than the diameter of the Moon, and a massive mountainous plasma plume from its south pole, which extended down to the Earth's horizon (as seen in Egypt and Mesopotamia). Saturn, on the other hand, had probably distanced even further, and may already have become just a mere speck in the sky.

[Image: Jupiter with a banded headdress on a throne of a temple glyph. From the stele of Hammurabi. After printablecolouringpages.co.uk.]

The "collision" between Saturn and Jupiter had changed the orbital speed and direction of both (actually for a total of four planets) and as a result assigned them to orbits much further away from the Sun. In effect, the movement of Jupiter and Saturn were outward bound spirals, only slowed by their travels through the asteroid belt. I suspect that Jupiter took about 890 to 990 years to finalize its orbit. The movement of Jupiter through the Solar System is detailed in the next chapter.

The title of "Sun" was transferred from Saturn to Jupiter everywhere in the world. The Egyptians simply relocated their original creator God, Ra ("sun"), from the North Pole to the ecliptic. The title "Sun" for Jupiter was deserved, for after Jupiter left the asteroid belt, it would have lit up the night sky brighter than the Moon. Plutarch suggested, in circa AD 200 (in *Isis and Osiris*), that Jupiter was seen at first as a globe three times the diameter of the Moon. That's big.

The tail of Jupiter, a plasma in glow mode, might have extended a half billion miles (800,000,000 km) away from its south pole. Because Jupiter has a very strong, but reversed, magnetic field (unlike comets which have no magnetic field), most of the plasma expulsion would leave the planet at the location of its north magnetic pole -- at the bottom. This tail is the mountain that Marduk rose on, "in the center of the sky," or, as the Egyptians describe, "in the primordial waters" -- the Duat. The few depictions we have show the plasma as a very steep mountain.

[Image: Left, carved ivory Amulet, Anatolia, circa 3100 BC. Right, carved petroglyph, China, circa 3000 BC. The "owl-eyed" petroglyphs occur throughout the world by the thousands.]

A lesser portion of the plasma discharge would impinge at the south magnetic pole, located at the north geographic pole (and thus at the top), and would broaden like plumes away from the planet. This is shown in Mesopotamian images as rays emanating from the shoulders in depictions of Marduk (Jupiter). The identification of Jupiter in Akkadian depictions is certain from the banded headdress he wears, which represents the banded atmosphere of the planet.

Jupiter would indeed have blazed like a sun once it left the asteroid belt. In historic times the comas of comets have managed to light the night sky to the point of blotting out the stars. Comets are only a few miles in diameter; Jupiter is 89,000 miles (140,000 km) in diameter. The Maya of classical times (AD 400 to AD 900) still called Jupiter "the Midnight Sun," as did many other peoples in historical times.

The planet with its circular coma traveled on the ecliptic, where all planets travel. The mountain tail, however, would extend far below the ecliptic and seem to shine into the "water" of the sea of the southern sky, the Duat. How much of the circular coma or the mountain tail would be seen under that condition would depend on the time of year. During more than half the year the ecliptic rises above the upper limit of the Absu.

Where the ecliptic dipped below the limit of the Absu, the coma of Jupiter would illuminate the Absu from behind. The central coma certainly would be bright enough to be seen shining right through the dust of the Absu. We also have later graphical images of the large red disk of Ra placed between twin mountains overgrown with reeds. The twin mountains are the Absu at the time of the equinox.

When Jupiter was seen in the sky, which happened for only a part of each year, it would first

be seen in the northeast or somewhere in the east, depending on the time of the year and the location of the observer. Initially it would be of a small size and would move west during the course of the night. Over the following few months Jupiter would loom larger when first seen at night, and closer to the south, and following this it would expand to its full size in the south. It would then diminish in size again, moving toward the west, and disappear for perhaps 5 or 7 months. As an exterior planet, Jupiter was not normally seen by day. Gudea of Lagash, however, claims seeing Jupiter as if during the day.

Cylinder B of Gudea, governor of Lagash in the 22nd century BC (circa 2141-2122 BC), reads that Ningirsu "rose in overwhelming splendor," "in the land it became day," and "he changes darkness into light." Ningirsu has been identified as Shamash ("sun") and is thought by some mythologists to be Saturn, but Saturn had disappeared long ago. This is a description of Jupiter, although perhaps a recollection (the archaeologically assigned date of Gudea's Cylinder B is a decade late). The very fact that we have these accolades almost certainly determines that the "overwhelming splendor" was not a regular phenomenon. Perhaps Gudea's acclamation resulted from seeing the additional brightness of Jupiter when it appeared above the Absu. That would happen only periodically, that is, every dozen years or so.

Shamash, held by archaeologists to represent the Sun (it means "Sun"), is Jupiter. E. A. Budge, in *Babylonian Life and History* (1925) quotes a Babylonian (Akkadian?) hymn to Shamash, as:

"[O Shamash,] thou stridest over the wide and deep sea. ... Thy beams of light go down into the Ocean, and the vast mass thereof seest thy light."

Here is a sun which lights up the depths of the "ocean" and walks across the sea, as could be seen in observing the Absu. And, as shown below, travels an undetermined or irregular course, and shines by night and, in fact, both by day and by night. It becomes even more amazing when Jupiter was periodically seen during part of the night and during part of the day.

"Never by day dost thou cast gloom, they face never becometh dark, thou fillest thyself all the night long, and lettest light stream forth from there."

This is not the Sun. This is not the Moon.

"Thou dost hasten over an unknown and remote course, leagues uncountably long. O Shamash, thou journeyest by day and turnest not back by night."

This is certainly not our current sun.

Jupiter became the reigning god of Heaven. How long the coma condition lasted I am not at all certain. I suspect that Jupiter continued to blaze in the night skies for only a few hundred

years. In the following chapter, I will suggest that the display ended completely (after one interruption) in 2150 BC.

The descendants of the pharaoh Khufu, builder of the first giant pyramid at Giza, added "Re" to their names after circa 2550 BC, as did all the pharaohs of the following dynasties. "Re" is Jupiter, but "Re" is identified by modern archaeologists with the daytime Sun. ("Re" or "Ra" translates as "sun.") The first pharaohs of the following dynasty (the fifth dynasty, after 2490 BC) construct "sun-temples" on the west bank of the Nile, in addition to their own burial pyramids. The sun-temples consisted of a steep obelisk mounted on a platform, looking like the outpouring of plasma from below Jupiter. The obelisk became the symbol for Re. Only six such temples were built by successive rulers of the fifth dynasty. The sun-temples stop being built, we can suspect, after the display disappeared.

The sun-temples are an indication that, during the period of the fifth dynasty (after 2494 BC), Jupiter stood in the sky as a large blazing globe. After some 50 years of these constructions (ending by 2445 BC), no additional sun-temples were ever built. We can assume that the coma of Jupiter had disappeared again. Eventually the blazing of Jupiter would have come to an end as the planet slowed its retreat from the Sun and its charge balance (electric potential) started to match the electric field of the Sun at its remote location. The next chapter will suggest a sudden final extinction of Jupiter and a blazing fire. That happened in circa 2150 BC. By that time Jupiter had stood as the Midnight Sun, except for two interruptions, one long and one short, for a 1000 years.

In both Mesopotamia and Egypt, the planetary Gods (which still included Venus, Mars, and Mercury) were now understood to travel along the river of the ecliptic and across the ocean of the Absu (Duat) by ship. How else could one travel over a sea? Since the rings of the Absu consisted only of thin layers of dust and gases, a bright object behind the Absu, like a planet, would cause a glare to spread in the horizontal direction. It would at least have looked as if the planet was being transported on a raft with sharply upturned stern and bow. After the fall of the Absu (in 2349 BC) only a single upper ring remained, so that planets would still be seen on a raft where the ecliptic crossed (fell below) the ring. Even in Roman times, all the Gods of Egypt were still shown in ships. It had become the proper way to depict gods. It is very likely that the last ring of the Absu remained in view through the Middle Ages of our era. It is the Uroboros of medieval alchemists.

For 3000 years the Gods were depicted in ships in Egypt. There are pottery depictions of celestial ships from before 3147 BC, but these portray the ship seen in navigation around the globe of Saturn as its bright crescent (as Talbott has suggested). During the time of the three Kingdoms of Egypt, statues of the Gods were ferried up and down the Nile to visit Gods at other temples and carried in processions in boats. The deceased also had to cross the sea of the southern sky, a concept already well established before the first Egyptian dynasty. Complete ships were interred adjacent to pyramids; two have been found next to the pyramid of Khufu (Cheops) at Giza.

The later *Book of the Dead*, which promises that the dead pharaoh will ride in the "barque of the Sun," is referring to the ship of Jupiter, Re, the Midnight Sun. This was not just an Egyptian fantasy; the form of this celestial ship was seen worldwide. [\[note 1\]](#)

"Virtually every mythical form of the sun god's dwelling -- be it mother-womb or world wheel, city, temple or kingdom, egg, throne, or circular serpent -- was declared to be a 'ship' sailing on the cosmic waters."

"It is not surprising, then, to find Scandinavian rock carvings showing the wheel of the sun resting in the cosmic boat, or to discover that -- from Assyria to Britain and from India to Polynesia -- images of cosmic ships either contained wheels or were set on wheels and conveyed around dry land in the rites. As symbols of the sun god's enclosure, ship and wheel merge as one."

-- David Talbott, "The Ship of Heaven" *Aeon* (1988)

Talbott ends up relating the disk (wheel) and ship to the crescent seen rotating along the edge of Saturn during the "Era of the Gods." But the ship with a disk or globe was also an image seen in the sky after the close of the "Era of the Gods." To the ancients the Absu or Duat was a "sea" without question and seeing the planet Gods traveling through this sea on a flat skid or in a boat was real.

The flat skid shape is the natural result of the radial spokes in the rings of the Absu, which result in reflective marks perpendicular to the spokes, and a quarter wavelength removed, as any photographer will verify. Because the Absu thinned out above the brightness of a planet there would be a lesser reflective mark above the image of the planet. This explains the long persistence of the "ship" imagery.

Note also that the "disk" or "wheel" representing the Sun God is always depicted as very large. Thousands of years of Egyptian illustrations never relinquishes in depicting the image of the "sun-disk" of Re as disproportionately over-sized. We are not being shown an object with a diameter of the Moon or Sun, but something vastly and impressively larger. The same can be said for the depictions of the "sun" in his boat in other lands in antiquity. This simply is not the Sun, but an immensely larger globe. If seen as three times the diameter of the Moon before reaching its final orbit, the coma of Jupiter would have had an actual diameter of three million miles. That is more than three times larger than the Sun. No other planet ever showed so spectacularly. The inner planets, Venus, Mars, and Mercury, might have been brighter, but never as large, except when Mars or Mercury cruised close to Earth. The inner planets are peanuts compared to the pumpkin size of Jupiter -- both in actual diameter but especially when seen with a coma. [\[note 2\]](#)

The disk of Jupiter was red, as clearly seen in Egyptian depictions. It was no longer green, as Osiris had been depicted earlier. I do not know when this changed. There are Vedic documents which claim that Jupiter had a green body but was dressed in a red mantle. In

Egypt all the renderings of Re consist of a large red disk (this has thrown off the archaeologists). The *Chilam Balam* books of the Maya also claim Jupiter turned red:

"Red was the mat on which Bolon-ti-ku [Jupiter] sat. His buttock is rounded [shaped] like a hat, as he sits on his mat."

Other passages of the *Chilam Balam* claim that the whole world became red during the rulership of Bolon-ti-ku. [\[note 3\]](#)

After an annual disappearance of some months, Jupiter would first be seen again in the east. Many people watched for the appearance of the red star of the east. The Saturnian researchers have had problems with the identity of a Red Morning Star, and have all but suggested that Mars at one time might have been on an orbit between the Earth and the Sun, similar to Venus. North American Indians (the Pawnee) paid tribute to a morning star which was red, for which neither Venus nor Mars would properly qualify: Venus was not red and Mars was not an inner planet, even if it overran the Earth's orbit. Jupiter, however, had a massive red coma.

In the early 20th century it was suggested that Mars would have been the red star. The appearance of Mars in the east was checked against Pawnee festivities for the period of AD 1800 to AD 1900, but the festivities happened only at 9 or 10 year intervals. Mars is overtaken by Earth (making Mars appear in the east) every two years.

The original "red star" was Jupiter, which was overtaken by Earth every 12 years (today), but at a reduced interval at an earlier time, when Jupiter additionally would have been very large and very red.

The progress of Jupiter across the heavens is so slow that Earth catches up with a sighting of Jupiter in the sky. During a portion of its travels it might appear during the day or part of the day. Jupiter was certainly bright enough to be seen in daylight. Each following day (or night) would bring Jupiter higher up into the sky, since the Earth traverses a zodiac house (30 degrees) in a month whereas Jupiter would require a year to do the same.

Jupiter had a calming influence. Over 3000 years he never lost his status as chief God. He also never showed unexpected behavior, unlike the inner planets -- the other Gods. These secondary Gods visited Jupiter frequently, that is, they were seen in the same sector of the sky, but Jupiter only slowly moved from one zodiac house to the next over the course of a year. And he remained on his mountain.

The Temple Culture

The "Era of Kings" started with a legacy from the immediately preceding "Era of the Gods" and we can therefore assume that these times started with the initial expectations of the

resumption of a good life, order and purpose, and a working economy. However, none of these were initially forthcoming because of the interruption of the flood followed by the absence of guidance from the Gods. Only the temple culture, which had been in charge of the economy in the previous age, provided a unifying direction. The priests were called upon to explain what the Gods had done, why they had left, and what could be done in their absence.

The solution to the void left by the departure of the Gods was the installation of a king as the steward of God or as the God himself. This happened simultaneously in Egypt and Mesopotamia. It cannot be stressed enough what a radical change was made in 3100 BC when civilizations with no apparent leadership became kingdoms and theocracies. The need for authentication and authority must have been intense.

The solution in both locations was also to foster a civilization which attempted to recapture the past. The building of cities, city walls, temples, and graves, the construction of canals, production of grain, and the waging of wars, writing, the assignment of kings as the stewards of God, and a hundred other implementations were all believed to have been instituted by the Gods above the north horizon of the previous age. [\[note 4\]](#)

Simplistic as this might seem, all indications are that this was sincerely believed by the people and by the priesthood and the kings. Both Sumer and Egypt used languages with a grammatical structure which looked only to the past and which in effect held that the future was something one backed into. And with such a reversed sense of time and the inability to imagine alternatives, the mandates of the Gods and their earthly representatives were inarguable, and answered questions for the masses, at the same time providing justification for the governing elite.

This mindset induced a strong conservatism. It also removed the possibility of mankind claiming for its own the advances made in the past. Despite the extensions in trade and commerce and the growth of cities, civilization remains but an imitation of the original "Earth," and virtually nothing new is introduced for the next 2000 years. Everything was, by design, a reflection of "how things were at the beginning," and was supported by the languages used throughout Mesopotamia and Egypt, which did not have a future tense. A slave-state mentality had been introduced which would control societies for the next three millennia. [\[note 5\]](#)

Something Is Missing

Is this the legacy of the "Era of the Gods," during which humans had learned to manage large farming and trading concerns, and had invented the wheel, bronze metallurgy, irrigation, and writing? You would expect a continuation of new ideas and advances. And, in fact, there are some. For one thing, the politics of the city-states continued to evolve. Larger and much more complex irrigation projects were instituted. In Sumer, trade was expanded to include the import of metals from the region beyond the Zagros mountains, wood, stone, and

obsidian from Anatolia, and other products from India and East Africa. Egypt expanded its territory to control copper mines in the Sinai, transport of basalt blocks from as far south as Aswan, import honey from Crete, and lumber from Lebanon. There were changes and large improvements in ceramics and in bronze metallurgy.

However, there were no changes which did not proceed directly from a previously known process. There was a lack of imagination compounded by the turn to conservatism in the solidification of social structures, reinforced by the rapid rise of a privileged elite and the ever-expanding religious rites and superstitions.

It is this last, the overwhelming obsession with the multiple Gods, spells, ceremonies, and religious practices, which remains foreign to us today. And, as Julian Jaynes notes in his book *The Origin of Consciousness in the Breakdown of the Bicameral Mind* (1976), it is completely at odds with the expectation one would have for a people descended from Paleolithic hunters with their ever-expanding production of art and tools, or the ingenious farmers and villagers of the Neolithic who developed fishing, herding, and farming. Yet, the preoccupation with the demands of the Gods remains the central issue of the later civilizations for over 3000 years.

Is Jaynes on track? Something certainly was missing in Mesopotamia.

"From its beginnings in Sumer before the middle of the 3rd millennium BC, Mesopotamian science was characterized by endless, meticulous enumeration and ordering into columns and series, with the ultimate ideal of including all things in the world but without the wish or ability to synthesize and reduce the material to a system. Not a single general scientific law has been found, and only rarely has the use of analogy been found."

-- *Encyclopaedia Britannica*, 15th edition

We do have a few examples of analogies. One is the Mesopotamian use of tokens since 8500 BC to represent products, and the use of bottle seals as signatures. Both of these are metaphorical displacements. But what is astounding is that it took 5000 years to take the next step -- that is, to map these three-dimensional objects to a flat plane and produce a script. The first step was to pictorially inscribe the content on the outside of sealed clay jars containing the tokens. These were used as bills of lading by trade caravans and ships. The conversion of these pictorial inscriptions to a usable script took much less time, and its development was predictable as an extension of the first efforts. The tokens were eventually discontinued.

[\[note 6\]](#)

Describing a similar lack of the ability to conceptualize, I.E. Edwards's book *The Pyramids of Egypt* (1985) reads like a comedy of errors when it comes to the details of the construction of the pyramids of the Old Kingdom (Dynasty 4 through 6, 2700 BC through 2200 BC). One structure after another was obviously interrupted by changes in the plans. What the book

describes, over and over again, and over a span of hundreds of years, are obvious changes in construction after considerable work has been completed. Subterranean tombs and access Tunnels are frequently re-excavated or moved to a different location. This happened with the exterior buildings as well (the valley building and mortuary temple). Walls and building extensions were added and subtracted almost arbitrarily.

I am not talking about the inferior completion of a pyramid, or failure to complete the pyramid of a predecessor, or the theft of materials from an existing pyramid in order to complete a later structure. And it is not that the Egyptians could not measure accurately. The pharaohs oversaw the work on their graves closely, often relocating to the site of the construction. The crews could locate a tomb room exactly under the apex of a pyramid when required to do so. However, rarely are the first efforts at digging the subterranean structure correct. Everywhere we see changes in direction, blind corridors, abandoned rooms (and not just for the purpose of foiling potential grave robbers). Although inconceivable to us, it seems that the overseers lacked the imagination to incorporate the details of a structure into a single unit, and frequently could not coordinate the excavation crew with the pyramid crew (although, overall, an enormous amount of work was completed).

Developing Consciousness

This failure of a complete overview, the inability to simultaneously see the details and the complete picture, extends to art as well. It is apparent in the images of Sumer and also in the standardized Egyptian depiction of the human body on flat surfaces showing a frontal trunk but with the head and legs in profile. This was noted by Jaynes, who adds that this is also especially to be noted among early Greek two-dimensional figures, which are often shown as curiously disarticulated groupings of arms, legs, trunks, and heads. This does not extend to three-dimensional art. Even the earliest Egyptian sculptures in the round were totally realistic, even if somewhat idealized.

The failure in imagination is a lack of subjective consciousness and this shows also in the languages of Mesopotamia and Egypt. Julian Jaynes notes that the Sumerian, Akkadian, and Egyptian languages were "concrete from first to last." The languages had no room for analogies or metaphors. The speakers could not imagine alternatives, perhaps could not imagine themselves. To *imagine*, one has to take a leap from the concrete. It requires the mental construction of imagined action beyond the exigency of the moment and the needs of the everyday. [\[note 7\]](#)

The method of overcoming this failure in imagination, Jaynes proposes, is through an extended use of metaphors. The primary trope is analogy, a space in the mind which is mapped to the equivalent space in the real world. With the addition of an imagined self inhabiting this imagined space, we are suddenly presented with ever-expanding possibilities of imagined actions in these places, interpretations of the effects of the imagined actions, and even the design of tools imagined as solutions to problems. We, in our age, do this sort of

mapping to a mental space with past, present, and future experiences, testing the efficacy of possible actions by stepping through them in our mind. We also lay out time and mathematical concepts as viewable "spaces" in our mind.

Jaynes's concept (in brief) of consciousness -- more precisely, *subjective consciousness* -- is exactly this placement of an "imagined I" into imagined spaces in the mind. It is not actually "you," but a substitute, an analog. You can look through the "eyes" of this "substitute I" or even observe yourself from afar in your mind. If something in real space and time requires your attention, the "I" will shift to be located directly behind your real eyes. Note that, as so defined, "memories" (as we imagine recollections) and "self-awareness" are not part of "subjective consciousness." These are biologically determined and are common to all animals. Jaynes suggests that historically, subjective consciousness was a late and learned acquisition for humans. Subjective consciousness is learned, and is culturally transmitted. Some people never learn it, yet they will appear fully functional.

The stupendous advantage of subjective consciousness is the ability of the mind (actually the speech areas in the left rear brain) to be able to analyze the outcomes of multiple alternative actions, to guess what others might think and do, and to understand how others see us. Our subjective consciousness is responsible for all our analytical abilities. We use this with such facility that it is almost impossible to recognize the part of us which does things without "thinking," things which include all rote activities. [\[note 8\]](#)

Just as language is learned by children from their parents, so is subjective consciousness. You can watch parents proposing "what if" situations to small children. Learning subjective consciousness requires language as a base, the ability to use metaphors as a means, and the examples of others. Jaynes places the maturing of subjective consciousness by individuals at about age 7 or 8. Subjective consciousness involves the ability to recognize yourself as seen by others, as an "analog I" which is internalized and placed into the space of the imagination, and which enables you to vault through time. [\[note 9\]](#)

And, if not from parents, how is such subjective consciousness learned? It is also learned from meeting strangers (not friends and familiar faces), an experience which forces upon you the idea that others see you, and thus suggests a narratized space in the mind where you can see yourself being looked at by others. This reflected "analog I" becomes the first spark to light up the enormity of possible analogical mind-spaces which compose subjective consciousness.

Subjective consciousness can be learned quickly. The same Inca army which, on November 16, 1532, walked into the trap set by 110 Spanish soldiers and lost 8000 men because there was no Divine Guidance on how to respond to the novelty of metal-clad men on horses, became engaged in guerrilla warfare and laid ambushes for the Spanish within months after the death of the Emperor. [\[note 10\]](#)

Jaynes claims that in the Middle East subjective consciousness didn't develop until after 1500

BC. In the immediate 2000-year period after the "Era of the Gods," which had still looked with certainty towards the beginnings, subjective consciousness simply was not needed. As long as nothing changed, life was predictable and safe. It took a number of worldwide catastrophes, which Jaynes did not address and was not even aware of, to force a change.

According to Jaynes, the Middle East started to wake up to consciousness with the arrival of "strangers." For Mesopotamia the strangers are the Indo-European invaders from the steppes of Russia and from India and Persia -- the Hittites (1600 to 1200 BC), who settled in Anatolia, but especially the later Medes and Persian invaders of Assyria in 500 BC, followed by Alexander's conquest of Persia somewhat later. Many of the Greeks, in fact, had already passed the consciousness horizon with their wide trade contacts with other peoples, and their near-wholesale rejection of the authority of kings. In contrast, Sparta, a Greek state which remained a kingdom through the Classical era, never produced anything of note except mindless warriors. [\[note 11\]](#)

Their constitution has stood them well for 400 years.

-- concerning Sparta, paraphrased from Herodotus, *The Histories* (circa 400 BC)

We also have to wonder at the *myths* and *legends* which have come down to us, since the lack of subjective consciousness precludes detailed memories. We can all verify this for ourselves, for we remember little or nothing from the first few years of life -- when we lack language -- and little from before the age of seven or eight -- when we lack the imagination to embroider remembered experiences, unless these were outstanding or later retold to us.

This suggests that mankind would not be able to recall its early history except for unusual experiences, and further might suggest that the *myths* and *legends* are fabrications of a later age. But, just as we remember some events from childhood if they are retold to us (or to ourselves), so humans would also have been able to recall stupendous past events if these were retold or replayed.

Retold as *myths* from generation to generation and acted out in ceremonies, these past events would have become concrete tribal memories. The accuracy of the retelling would then have been carefully protected. Note how small children will correct you if you diverge from the telling (or reading) of a story that they already know. Ancient festivals reenacted the events, preserved the memories, and, at the same time, fleshed out the stories to fill those memories with details. [\[note 12\]](#)

The stories ("myths" to us) and festivals spoke of the deeds of the Gods, copied their actions, and illustrated their appearance. Mexicans today still play a football game with a flaming ball called "Purepucha," recreating the creation events described in Michoacan myths. Through this dramatization everything displayed in the heavens becomes part of the earthly domain and localizes the Gods to specific temples and cities. When mythologists today suggest that the Gods of mythology are only human heroes elevated to godly status, they have it

backwards. We are seeing the celestial Gods made human. Which is also exactly how most of mythology reads today. [\[note 13\]](#)

Bicameral Kingdoms

The adoption of subjective consciousness seen in the Middle East beginning after 1500 BC is also accomplished in India and China at about the same time, and likely due to similar causes. Did anything like it happen in the Americas before AD 1500? The problem with finding an answer to that question is that we only know the story from the invaders.

On the one hand, for Mesoamerica, we have a record of the dialog between Aztec philosophers of the Valley of Mexico and Spanish theologians, recorded by the 16th-century historian Sahagún, which certainly attests to a well-developed subjective consciousness. These theological discussions are only now being published. [\[note 14\]](#)

Jaynes noted the striking similarities between the Middle East of 1500 BC and the Incas of South America of AD 1500. The parallels between the Inca emperors of AD 1500 and the pharaohs of third millennium BC Egypt are astounding, despite a separation of 3000 years. For the Inca emperor, as for the pharaoh, the purpose of life was union with the Gods. When the Spanish threaten one of the Inca cities, the Incas flee, leaving behind their gold, belongings, and food, taking only the mummies of their past god-kings to hide them in the mountains. We see the same in Egypt where the priests frequently remove mummies and hide them elsewhere when threatened by grave robbers at times of unrest.

Julian Jaynes proposes a generalized model of theocratic city-states and empires, and calls these civilizations "bicameral kingdoms." "Bicameral" refers to the separation of volition and consciousness in the speech centers of the brain. The start of any human activity is initiated almost exclusively by the right rear brain. This area of the brain is also responsible for generating speech which was not consciously thought out beforehand. Because of this, the right brain seems to be the location of the will. [\[note 15\]](#)

Consciousness, on the other hand, is located almost entirely in the left rear brain, as is also the ability to understand the speech of others and the ability to produce grammatically correct responses. The left brain is not aware of the right. This is, in fact, extensible to all right cerebral activities, most notably to mental dysfunctions. Oliver Sacks details this in case studies, in *The Man who Mistook his Wife for his Hat* (1970). We live in our consciousness, unaware of the input from the right hemisphere.

Bicameral kingdoms have a number of features in common, including the following.

- First, there was either a city God, with the city and surrounding area operated as a theocracy, or a king, who was held to be the God or the Son of the God and was revered as such, even after his death. Theocracies included Sumer and, later, Akkad (in fact, all

Mesopotamia remained as theocracies up to Persian times), India, China, and all of Mesoamerica. Societies under the direct rule of God or the Son of God included Egypt, Japan, and the Inca empire.

- Second, the dead in these societies were considered alive in some way, and in need of material goods, especially foods, to accompany them in their graves. This practice actually extends far back into more remote antiquity, but becomes obsessive with the bicameral kingdoms. The new kingdoms initially buried their kings complete with their retinue. This practice seldom lasted more than a few generations in Egypt, but continued for 700 years under the Shang dynasty of China (and was only prohibited by the Chou after circa 1000 BC). The 200-year-old Inca kingdom still practiced it in AD 1532 when the Spanish arrived. In bicameral kingdoms throughout the world, people (and certainly the elite) were believed to become Gods on their death. The enormous ceremonial center of Teotihuacan in Mexico (200 BC to AD 700), at one time supporting 200,000 inhabitants, was known as "the Place Where Men Become Gods." [\[note 16\]](#)
- Third, the kingdoms of the "God on Earth" were jealous of any competing Gods, including those which had come before, and would destroy all signs of the preceding Gods, just as the cities of Sumer and Akkad would readily attack their contemporaries and haul off the God statues from the temples of nearby cities. The destruction of all previous records by edict of the Emperor of China in 213 BC is an example. The Aztecs destroyed all the manuscripts of their predecessors in the Valley of Mexico shortly after AD 1400. The priests who followed the Spanish invaders into the Yucatan in the following century burned all the books of the Maya.
- Fourth, the citizens were incapable of deceit, or more fundamentally, incapable of imagining the deceit of others. Not that these people could not lie or steal, but they were incapable of mentally "narratizing" a complex series of deceptive actions either by others or by themselves. This is vividly illustrated with the Inca empire, which had subdued half the South American continent, only to fall to the deceit of a handful of Spanish soldiers.

As a corollary it should also be noted that these people had no morals -- there was no such thing as good or bad. Actions were ordered and the humans responded like robots. The heroes of the *Iliad* were motivated by glory and shame, without regard for their own life, as were the Spartans who held off the Persian army at Thermopylae in 480 BC. In the vacuum left by the departure of the Gods, religion had substituted prescribed duties for individual judgment and assumed the absolutist attitudes understood as the prerogative of the earlier Gods. What is absolutely astounding is that these attitudes lasted over 4500 years after the collapse of the "Era of the Gods" -- as in the case of the Incas, for example.

What we have in these civilizations are people desperately holding on to the past. They considered themselves "slaves of the Gods," only now it was the local God in residence at each temple who needed to be housed, fed, and adorned. Everyone was employed in the service of the Gods, and surplus produce and products from the countryside surrounding a temple were collected (as a tax) for the upkeep of the temple God, for redistribution to temple

craftsmen, and for long-distance trade for building materials and more exotic materials. All humans were as deeply invested in their assigned tasks as the worker bees of a hive. [\[note 17\]](#)

Population explosions are certainly the mark of each of these empires, including those which did not appear until long after the departure of the Gods, and Jaynes proposes that the elements of the bicameral kingdoms arise out of the need to control these large populations. But I question this. There is ample evidence that these kingdoms were voluntary societies where massive public works, whether digging irrigation canals or monumental building construction, were accomplished without coercion. This last becomes obvious with a closer look at the histories of Maya ceremonial centers. These were built with volunteer labor which depended only on the citizens' confidence in the leaders' connection with the spirit world. [\[note 18\]](#)

Jaynes suggests that these early civilizations were pre-conscious -- that is, not subjectively conscious. He suggests societies in which control was effected through auditory commands from the "Gods" -- actually the remembered admonitions of the governing class. This kept everyone to their task, and kept all things in order. Jaynes's use of "hearing the commands of the Gods" is a shorthand for the admonishing voice (which we still hear today) generated by the right hemisphere of the brain. In essence, these people, and perhaps especially the ruling class, were hallucinating. This description has turned some people away from a careful consideration of Jaynes's theories even though it is an accepted fact that the speech center of the right hemisphere acts as a separate but unconscious entity. [\[note 19\]](#)

But pre-subjective people are entirely functional humans. They can learn anything, including any skill, reading, and mathematics, they have the same sense of humor as the rest of us, they experience and express emotions, and they can converse with others in intricate details. It is difficult to distinguish bicameral humans from subjectively conscious humans. You will find yourself persuaded by each of the long soliloquies of the war chiefs of the *Iliad* when they meet in council -- yet no one among them takes action without receiving a command from a God. Bicameral humans seem normal. However, they rely heavily on the learned admonitions of parents and authority figures (blurting things out without any forethought, invariably in the context of "ought" or "should") and have great difficulty with novel situations. New situations require the ability to imagine a number of alternative actions which might be taken and then to make a selection based on the imagined results. A pre-conscious human does not have the ability to imagine the thinking of others, especially reflectively; that is, how others might imagine them as thinking.

The Flood of Noah

There is a disturbance in 2349 BC, 800 years after the flood of 3147 BC. There are changes in climate, noted by many researchers, perhaps to a limited extent in the Middle East, but apparently also in China. This is followed about 150 years later by an extended period of drought and dust storms, starting in 2193 BC.

From the interval of 156 years between these two climatic events, we would conclude that Earth was four times involved in an encounter with Venus, on a cycle of 52-year intervals. The interval of 52 years between events becomes a clear hallmark of disturbances by Venus and both 52-year and 104-year intervals between certain events are remembered by other nations at a later date. The 52-year cycle is assured, even for remote antiquity and even though the Earth's orbit would be different. See Appendix B, "The Celestial Mechanics," for how the interval can be derived for various periods in the past.

I would suggest, as others have also, that the planet Venus was the agent of the disturbances in 2349 and 2193 BC. In fact, we can be certain that Venus appeared a total of four times during this period. [\[note 20\]](#)

The first appearance of 2349 BC was absolutely spectacular and, at the same time, so psychologically disturbing to people the world over that this single event is frequently recorded as the very start of history -- often as a retelling of the flood of 3147 BC (as in the "flood of Noah"), coupled with the first appearance of the Moon. The most frightening aspect of 2349 BC was what looked like the collapse of the ocean in the south sky, the Absu. It was thought to have fallen onto the Earth like a flood, for the commotion in the sky was accompanied by endless rains and storms. The other disturbance was that the sky turned blood red. [\[note 21\]](#)

Claude Schaeffer, in *Stratigraphie comparée et chronologie de l'Asie occidentale* (1948), wrote:

"The great perturbations which left their traces in the stratigraphy of the principal sites of the Bronze Age of Western Asia are six in number. The oldest among them shook, between 2400 and 2300, all of the land extending from the Caucasus in the north down to the valley of the Nile, where it became one of the causes, if not the principal cause, of the fall of the Egyptian Old Kingdom after the death of Pepi II."

Schaeffer's estimate brackets 2349 BC, the first strike by Venus. The "traces" of 2400 BC to 2300 BC extended over a very wide area in the Middle East, from Persia to Greece, and included "violent earthquakes and tidal waves, and other signs of a natural disaster" (paraphrased by Velikovsky). But it becomes obvious that what we are seeing is a swath of destruction only extending over part of Northern Iran, Anatolia, part of the Levant, and Greece, with little or no evidence in Mesopotamia or Egypt (despite what Schaeffer wrote about "the Nile valley").

It would seem that the event of this era caused an expanding circle of destruction throughout South Central Asia (the location of Indian civilization), the Eastern Mediterranean, throughout Southern Europe and parts of North Africa, plus China. Other areas we are not aware of, because they were not built up with cities. There is little indication that the seismic shock crossed the Atlantic to make contact with America. Worldwide, the destruction in this instance seems to have been limited to earthquakes.

At the first instant the crust of the Earth would have been subjected to a severe compressive force due to the electric repulsion between Earth and Venus -- but only for a period of a half hour or less. The compressive forces would have been followed by lifting forces as a result of an induced charge of opposite polarity. (More on the sequence in Appendix B, "The Celestial Mechanics.") Areas adjacent to the "impact area" would have experienced an uplift initially. Areas outside of the region of the initial "contact" would have been subjected to lateral seismic forces (earthquakes) as seismic shock waves spread around the Earth.

The destruction described by Schaeffer apparently pertains mostly to the end of this period, 2193 BC, when agriculture fails worldwide.

There seems to be no evidence of large-scale fires at the earlier date of 2349 BC. The damages noted by Schaeffer (he only presents information for the region west of the Himalayas) were due to seismic waves resulting from the initial compressive force to the part of the Earth that faced Venus, followed by somewhat later lifting forces. The earthquakes would have been astounding.

The contact with the plasmasphere of Venus would have resulted in an attempted charge equalization through the delivery of lightning bolts. At a closer distance between the two planets, such massive lightning strikes would have been capable of melting mountaintops, ripping out and incinerating forests, and lifting boulders and hilltops into the vortex of a fiery hurricane which would have moved west at over 500 miles per hour (800 km per hr), which is the linear speed of rotation of Earth at 30 to 40 degrees latitude. Traveling lightning bolts would have incinerated forests and grasslands, resulting in placing nanometer carbon dust in the stratosphere, with a resulting shadow extending over all of the Earth for centuries.

But in 2349 BC, there was nothing like that, as far as we can tell. This was not a traveling lightning strike, for there was no close electric connection to Venus. The planet was 20,000,000 miles (32,000,000 km) away (probably 17.5 million at a minimum, see later calculations).

In 2349 BC there was no follow-up lightning strike. This was an unusual condition and unexpected, but kept the Earth from experiencing the massive forest fires resulting from a traveling arc, and the darkness which could have followed the fires for hundreds of years. But, as mythological sources in India, Canaan, Mesoamerica, and China have it, the charge equalization consisted of a plasmoid arriving from 20,000,000 miles away. The event of 2349 BC did not result in a darkening of the skies as would be indicated by a failure of agriculture worldwide. We would also have to assume that the plasmoid dissipated at the Van Allen Belts or the ionosphere. The charge which held the dust of the Absu in suspension may have saved the Earth from being incinerated.

In this case, where the plasmoids had to travel a very large distance, the charge equalization (the thunderbolt) would have arrived late. The first plasmoid from Venus took six hours to arrive (in my estimate). See the chapter "The Day of the Dead," for details of travel time and

speed. Also, from descriptions we have, it looks as if the initial gigantic plasmoid was followed by 9 smaller ones. This too, is expected for such a very remote interaction.

However, there was of course a "flood" thought to be associated with this electric contact, for it looked as if the Absu fell and drained onto the Earth -- although actually discharging to the upper atmosphere and causing severe rain storms. The disappearance of the "sea" of the Absu would have been enough to convince everyone of where the rain and storm water came from. The event was understood everywhere as a "flood" from the sky -- in the Eastern Mediterranean, in China, in the Americas.

From the damage done in the Eastern Mediterranean north of about 33 degrees latitude we know that the initial repulsive blow from Venus was delivered north of the equator, and the Earth's rotational axis would have undergone a gyroscopic reaction as the northern hemisphere was shoved away from the Sun. Thus the path of potential destruction (as an arc was delivered) would have traveled at an angle inclined to the equator, so that Western North Africa could have fallen on the path. By the time Central America faced Venus the gyroscopic reaction would have started to carry the equator back "down" to where it belonged, so that the remaining path of destruction angled up again. I'll develop more details in the next chapter.

The second appearance of Venus in 2297 BC and the third in 2245 BC seem to have left no record that we are aware of. Yet it is certain that these happened. People took no note in myths and histories because the results were not spectacular or religiously significant. The last event in 2193 BC will be discussed separately below. Again, as with the previous two, the contact in 2193 BC was not noted in any records. But in this case we have substantial secondary data available.

The first event, of 2349 BC, marks the traditional Noachian flood. It involved an electric contact with Venus which increased the orbit of the Earth, bringing Earth close to the established location of the Moon. It also resulted in a sudden dispersal of the equatorial rings of the Earth, accompanied by storms, rains, and hurricanes, which became known in the Bible as the "flood of Noah," or, as the Sumerians and Akkadians called it, the "flood after the flood." [\[note 22\]](#)

The story of Noah and the flood is well known from the Bible. But, as I pointed out in a previous chapter, flood stories are ubiquitous. People in all regions of the world have flood stories. Most of these stories show no signs of having been borrowed from other people, yet they all involve the same elements -- a worldwide inundation, survival of a few people with their animals in an ark, a boat, or a canoe, and anchorage at a mountain while waiting for the waters to subside.

When the Sumerian *Epic of Gilgamesh* became available in translation in Europe in the 19th century, it astounded everyone -- for it contained a clear description of the events of the flood of Noah, including the ark, the animals, and sending out birds to test for dry land. However,

both the flood of Gilgamesh and the flood of Noah are the conflation of the Black Sea flood of 5600 BC and the World Flood of 3147 BC.

In 5600 BC, Noah didn't build an ark. As a Black Sea fisherman, he had a boat. He didn't collect all the animals in the world, only his family and farm animals, and as much seed and fodder as possible. He didn't moor at a mountain in Northern Iran, but landed at the river Halys or rounded the Anatolian plateau to land in the depression between the Pontic Mountains (bordering the Black Sea in the south) and the Caucasus Mountains (to the east of the Black Sea). From there, his "survival story" spread south into Iran and Anatolia, eventually to reach the plains of Mesopotamia and the Levant. After another flood and the passage of nearly two thousand years, the ark was the Sun-lit crescent on Jupiter, and the mountaintop of the anchorage was the lower plasma tail of Jupiter, decked in green. But they had been seen by all.

To the Hebrew priests who compiled the books of the Bible after 536 BC, the flood was an actual event experienced in 2349 BC. It was, for them, the only flood ever and the centerpoint of their people's history. However, the date, although widely accepted among Christians since Bible chronologies were established in the 17th century (Ussher and Newton), is backed up by very little physical evidence. (I will return to this in the next chapter.) Some think it may have been a local event. We are not even certain where in the Middle East Noah was to be found in 2400 BC. It might have been Anatolia, Mesopotamia, or the Levant, or even Arabia (with some scholars suggesting India).

The chronology of Mesopotamia (Akkadia) is only firmly established after the putative "flood of Noah," but there is no mention of a flood. The only strong coincidence is from China, where in 200 BC, long before Christian influences, the catastrophic flooding of China was dated to 2350 BC. The people of Mesoamerica also date one of the "creations of the world" to this time. I will return to this also in a later chapter. [\[note 23\]](#)

The Jewish world history (the Bible) was compiled sometime after 536 BC, when Cyrus allowed the Jews to leave their Babylonian captivity and return to their homeland with orders to rebuild the temple of their God. Cyrus financed the rebuilding and returned to them the "vessels of the temple." We could presume that their books and records were returned with these. The earliest of these books, Genesis, which includes the story of the flood of Noah, was held by tradition to have been written by Moses a thousand years earlier, after 1490 BC.

The priests subsequently edited and collated their books into a history of the world -- a creation epic. The editors must certainly have been familiar with the thousand-year-old Babylonian *Enuma Elish* creation epic, which at that time constituted the only other recorded history of the world from creation onward. (The *Enuma Elish* retells the flood stories found in earlier Sumerian epics.) But the *Enuma Elish* dealt with multiple Gods, and the Hebrews were monotheistic. I would also assume the editors knew the epic literature of Akkad and the *King List* of Sumer. We would have to assume that the Bible editors knew that the list of the "Kings before the Flood" was recorded in days, not years. And it would have been known by

the editors that in a previous era the year was shorter (having all but witnessed the change in the year's length which happened in 747 BC), and that it was even shorter in earlier times -- or, in another way of understanding, that people lived longer lives. Their sacred book would certainly conform to these oldest known histories of the world, but would be populated with their own patriarchs and informed by their own records.

It is generally assumed that the Bible is derived from Mesopotamian records and legends. I do not think this is likely. I think it is a parallel record, perhaps partially oral, which was brought into conformity to known records at this late date. The flood of Noah is, in fact, only one of the world's more than 500 parallel flood stories. It is also sufficiently different from the Mesopotamian flood legend to be considered as standing on its own. [\[note 24\]](#)

The history of the world as presented in the Bible is, at any rate, unique. It presents a record of creation which parallels the Mesopotamian creation epics (and those of many other people) but conceives of a God outside of the visible domain of this world. This last is the result of a change in humanity's point of view on the Gods seen throughout the world after 650 or 600 BC, which will be discussed in a later chapter.

The Bible thus dispenses with the multiplicity of Gods of the other nearby cultures and remains consistently monotheistic. In itself, this is not unique. The Chinese were monotheistic, at least to the point of acknowledging a single supreme God, as were the Persians. But the book of Genesis, for example, takes the signs in the sky, which the other cultures had equated to distinct Gods, and treats them as humans. One description especially, the creation of Eve, stands out, as follows:

Adam is the lonely globe of Saturn in the sky. God -- the God outside of creation -- takes pity on him and creates a woman for him by extracting a rib and subsequently healing the wound. This is clearly the image of the expulsion of Venus from the side of Saturn, still connected with a rib-like plasma appendage. The image was common to the experience of all the tribes of the Eastern Mediterranean, but the interpretation by Moses was unique.

The Bible gives no date for the flood of Noah, but notes other events after the flood which can be matched to known dates. A correlation of Biblical events to known dates was attempted by James Bishop Ussher in AD 1650 and still stands as a classic work. Ussher dates the start of the "Universal Flood of Noah" at 2349 BC and the end at 2348 BC.

[\[note 25\]](#)

The "flood of Noah" happened as the Earth's orbit increased and Earth joined the Moon at the Moon's established orbit. The result was that the Moon revolves around the Earth in a plane tilted up at about 5 degrees (as seen from Earth) -- not on the Earth's equator, but otherwise at the same average distance from the Sun. I suspect (from the records presented as sculptures at Maya Palenque) that the Moon did not fall into a regular orbit until 2283 BC, some 50 years after it first appeared. The Chinese *Shu King* claims it took 30 years.

The appearance of the Moon probably marks the "sign in the heavens" after the flood of the Bible. It is the end of the "time before the Moon" noted by Aristotle and others in antiquity. "Sin" ("Moon") becomes popular as a personal name in Akkadian Mesopotamia after 2350 BC. Sargon of Akkad, who conquered Sumer shortly after "Noah's flood," appoints his daughter as priestess of the Moon god ("Nanna" in Sumerian) of the Sumerian city of Ur. His granddaughter held the same position.

A Second Strike

The event of 2349 BC is followed by another worldwide disturbance in 2193 BC (three times 52 years, 156 years later). Again Venus makes an electric contact with Earth, the fourth in this era. With this event climatic changes are recorded worldwide, with social upheavals and abandonment of settlements spanning two hundred years. With this second event the Old Kingdom in Egypt comes to a sudden end, not to recover for more than 185 years. [\[note 26\]](#)

At the same time the Mesopotamian empire of Akkad collapses. Sumer had been conquered by Sargon of Akkad in 2335 BC, part of an empire of conquest which stretched from Elam on the Persian gulf to the Mediterranean. But his dynasty's brief hold is lost in 2193, coincident with the second disturbance. The empire fails economically and the barbarian tribes of the Zagros mountains descend into the Akkadian plain. Even a hundred years later the land of Akkad laments:

*"The large fields and acres produced no grain
The flooded fields produced no fish
The watered gardens produced no honey and wine
The heavy clouds did not rain"*

-- City of Akkad, circa 2100 BC.

Some climatologists have assumed that Mesopotamia and Egypt lacked rains during this 200-year period following 2193 BC. But the laments from Akkad, quoted above, do not speak of a lack of water, but of a lack of growth. This speaks of a downturn in temperature and, most likely, a lack of sunlight. It is very similar to the darkness which will envelop the world 700 years later, after 1492 BC, when the Hebrews "walked in darkness" and Mesoamerican recollections claim that a generation of people grew up in darkness. An oceanic strike of an arc from Venus traveling partway around the world would not have produced a cloud cover lasting for years. But an arc traveling across the land of Earth would cause extensive fires. This is probably the most likely cause for the 200 years of darkness.

There is other data from this 156-year era. The endless reconstruction of Stonehenge is interrupted for 200 years after circa 2400 BC. Malta, with its temples and worship of the Fat Lady, is vacant after 2200 BC. Two hundred years of wind-blown dust and volcanic ash show up in the Eastern Mediterranean after 2200 BC. The Indus river fails to produce enough

water for agriculture and the parallel Sarasvati river dries up. The Harappan culture along the Indus (of over 250 cities and villages) declines slowly and disappears by 1900 BC. The Indus river region (lower Pakistan) turns into a desert. China's culture nearly falters. European construction of grave barrows ends for the most part by circa 2000 BC. [\[note 27\]](#)

The strange specificity of the area of destruction in the Middle East has suggested an air blast to some researchers, perhaps a Tunguska-like meteoric event -- an exploding bolide arriving from space. But most likely the two disturbances of 2349 and 2193 BC, the flood of Noah, the later demise of the Old Kingdom of Egypt along with the collapse of Akkad, were caused by the electric interactions of Venus. The restricted path of destruction, the damage caused by fires (also localized), the tilting (gyroscopic swing) of the axis (which is recorded in legend in China and as history in Mesoamerica), and then the later blockage of sunlight for an extended period of time, are all the marks of an alignment with a large planet and its electric field interaction with Earth. I will offer some additional details in the next chapter.

The two disturbances were 156 years apart, three times 52 years. The period of 52 years will remain as the mark of Venus's interactions with Earth: an 800-year span where nothing significant happens, then two or more contacts at 52 year intervals (or some variation of 52 years). In both 2349 BC and in 2193 BC the orbit of Earth changed. The year changed to 260 days in 2349 BC, and (I suspect) to 273 days in 2193 BC. [\[note 28\]](#)

After a few hundred years, Egypt will reorganize as the Middle Kingdom and start in again to build pyramids as grave markers and will do so for another thousand years, spreading ever further south along the Nile. Akkad and China also recover. The Harappan cultivation of the Indus valley is abandoned as its people move into the Ganges region.

In the next era, Mercury will become a prominent God while Venus will continue to lurk in the background. In the next chapter I will turn to some additional important considerations of the events surrounding the "flood of Noah."

Endnotes

Note 1 --

A similar condition with respect to the southern sky as a destination for the dead, occurs in the central Valley of Mexico, as related by the Spanish historian Sahagún in the 16th century AD, and quoted by Javier Urcid in *Zapotec Writing, Knowledge, Power, and Memory in Ancient Oaxaca* (2005). We have the following:

"And also they caused him [the deceased] to carry a little dog, a yellow one; they fixed about its neck a loose cotton cord. It was said that [the dog] bore [the dead one] across the place of the nine rivers in the land of the dead ... And when the four years had ended, thereupon [the dead one] went to the nine lands of the dead, [where] lay a broad river. There the dogs carried one across."

As I have already pointed out in previous chapters, the "nine rivers" are the Mesoamerican equivalent of the Duat, called the "House of Nine Bushes" in the *Chilam Balam*. The "broad river" is the ecliptic, which was noted as appearing about "2 or 3 degrees wide" in the early 19th century of the current era. In the 16th century AD the river of the ecliptic was still visible.

[\[return to text\]](#)

Note 2 --

As I have pointed out earlier, for Jupiter to have looked the same diameter as the Moon, at the eventual location at 5.2 AU from the Sun, with the Earth at 1 AU from the Sun, the coma would have been nearly 3.5 million miles in diameter (using the tangent of 1/2 degree for the size of the Moon). The dark mode plasmasphere of Jupiter today is still 3.5 million miles wide (5.6 million km). A coma of this size would have encompassed the Earth if it had developed before Jupiter entered the asteroid belt -- but without ill effects to Earth.

Because the asteroid belt provided multiple targets for plasma discharges, I do not think a large coma was needed as Jupiter traveled to the end of the belt at a distance of about 4 AU from the Sun.

If Plutarch's Zarathustrian sources are correct, and Jupiter initially looked to be three times the diameter of the Moon, then when Jupiter first exited the last clump of the asteroid belt at about 4.7 AU, the coma would at that time have had a diameter of 10 million miles (16 million km).

[\[return to text\]](#)

Note 3 --

"Rounded like a hat" can also be read as "sharply pointed" or could mean "shaped." The 16th century AD *Chilam Balam* dealing with ancient celestial phenomena apparently copied from illustrated glyphic bark books of great antiquity. We are here encountering a verbal description of an image for which the physical basis had been lost to memory. The "pointed hat buttocks" is probably a reasonable description of a depiction of the coma extending from the bottom of Jupiter.

"Sitting on his mat," however, is normally considered as a metaphor for rulership.

[\[return to text\]](#)

Note 4 --

City walls are not necessarily for defense. The first use of walls around compounds of buildings was probably to protect cattle or sheep from predators, like the "kraal" of 19th century Zulu villages, or as flood control. Lions roamed Persia well into Roman times, and would probably make excursions into the Mesopotamian lowlands for a kill.

But it must have become obvious before long that walls would also keep people from neighboring cities out. The walls around Jericho are a curious exception if seen as protection, as is the Jericho tower, since they were built much too early (6000 BC). It could be suggested that the tower was built to observe the southern ball plasmoid. In that case Jericho is no longer a cattle-trading town, but a religious center.

One might question the genesis of the planned cities arising in Mesopotamia and the Indus valley which seem to spring into being with no previous examples. The beginnings of the Harappan culture has not been dated, since earliest levels are below ground water. But I would suspect them to date to after 3000 or 2700 BC. This culture had examples of earlier cities -- in Iran and Baluchistan. The first cities in Southern Mesopotamia appear after 2700 BC, maybe earlier. They follow on earlier small villages and individual housing. Mesopotamian cities may have been derived from Iran, and certainly from the cities in Anatolia.

We should distinguish between villages and cities. Villages are a function of the availability of resources. If you live in a river valley where there is water, where you can plant, and surrounded by forests where you can hunt and cut lumber, it makes sense to settle a village near the water and farm land even if there are no more than a few families. People only live together when it makes sense to do so. Villages in forested Central Europe after 5600 BC are all located along river valleys.

Cities, on the other hand, are by and large based at a central temple, which soon become the centers for the manufacture of goods for trade. The temple compounds often precede the city, as for Uruk in Mesopotamia which is built adjacent to the earlier temple E-ana. Similarly in Egypt, and in Mesoamerica, it is the ceremonial centers which precede cities.

In Mesopotamia the cities were built by an immigrant people who had already lived in grouped houses (perhaps in Iran) for over a thousand years, or who may have come from Anatolia which boasts numerous cities much older than the Sumerian culture in Southern Mesopotamia. They moved into the flatlands of the Euphrates and Tigris because of the potential productivity (discovered earlier by local people). Much the same happens with the Indus valley Harappan civilization. These people had moved out from Baluchistan and probably also from the foothills near the source of the Indus and Ganges.

It looks like there was a sudden increase in population after 3100 BC in the agricultural centers of the world. As the climate became drier and colder, there were mass migrations of people from lands where the archaeology suggests more primitive conditions for housing, but not with respect to agriculture and animal husbandry. When groups strike out to new lands they are organized and naturally would plan their "new" cities with some reasonable order.

Having lived elsewhere in cities which had grown in helter-skelter fashion, it can be understood why the new cities were carefully planned in a grid fashion, and, as for example in the Indus valley, which were built from the start with sewers and running water.

This is not a case of foragers suddenly settling down. The foragers were probably largely killed in 3147 BC when coastal regions and lowlands flooded. Even if people survived, the game probably did not. The survivors of the flood are to be found in mountainous regions and far inland away from seas, coasts, and low areas. The farmers who suddenly appear after 3100 all come from the slopes and foothills of mountains. The survivors are those who had already learned to plant in addition to "gathering." In the lowlands of India or Pakistan there is no evidence of a prior foraging (hunter/ gatherer) population before 3100 BC.

[\[return to text\]](#)

Note 5 --

"... for nothing is older in human history than seeing the past as exemplary (the 'Golden Age'), the present as deficient, and then trying to restore conditions as they used to be. Few Egyptian Pharaohs came to the throne without undertaking to restore things 'as they were in the beginning.' That is, of course, the hallmark of the conservatism of traditional cultures. All traditional human societies justify their practices either by saying, 'that is the way things have always been,' or, if origins are in issue, by saying that the gods established things that way. Mythic accounts may or may not have been offered, briefly or elaborately, to explain how or why the gods did establish things in the proper way. Eventually the explanation becomes the thing itself, and the historical dimension is simply eliminated, as religions like Judaism, Christianity, and Islam directly present the founding commands of God in revelatory literature."

[\[return to text\]](#)

Note 6 --

Denise Schmandt-Besserat writes, in *Before Writing, From Counting to Cuneiform* (1992):

"The tokens were an entirely new medium for conveying information. Compared to the previous tallies, the conceptual leap was to endow each token shape, such as the cone, sphere, or disk, with a specific meaning. ... The token system was, in fact, the first code - the earliest system of signs used for transmitting information."

The use of ideograms or pictograms, pictures which stood for short nouns and eventually sounds, was in use from circa 3200 BC in Mesopotamia. Cuneiform is a more rapid "longhand" abbreviation of the "pictures." The cuneiform script eventually expanded to some 600 glyphs, representing short words or sounds, and was firmly established probably by circa 2800 BC in Mesopotamia.

[Image: Mesopotamian tokens. After Schmandt-Besserat.]

The use of pictograms, some identical to the original Mesopotamian, continued in Egypt, but were soon reduced to the sounds of syllables. It took 1500 years before an alphabetical script was introduced. Perhaps the reason the cuneiform never moved directly to an alphabet (the cuneiform was abandoned) is because the concept of an alphabet requires something entirely different. It requires sounds -- not words -- to be mapped to a flat space. This space, where sounds have a one-to-one (analogical) relationship to marks, has to be imagined and recognized. The alphabet probably derived from the sounds of Egyptian hieroglyphs.

Egypt, China, and Mesoamerica all developed mixtures of phoneme-based syllabaries, but none of them developed alphabets. The syllabary scripts of China and Mesoamerica had the advantage of being able to be read over a wide range of languages, since sounds were not strictly represented. The scripts were like magic.

On the other hand, it is not at all obvious that speech consists of finite units like consonants

and vowels, as is easily demonstrated from the first writing efforts of the young. The leap to representing individual sounds first shows in the prefixes used with the signs of cuneiform, as it does in the word-sound signs added to both the Maya glyphs and the Chinese script -- but they did not move beyond the specific functional addition made to the syllabaries.

The first alphabet was a vowel-less set of signs introduced in Canaan circa 1500 BC, generally attributed to the Phoenicians, but probably based on the Egyptian demotic (longhand) which was already reduced to assigning sounds to glyphs. Once demonstrated, it spread like wildfire. It was quickly adopted by traders of the Levant (and by Moses). The Greeks added vowels needed for their vocalization in about 700 BC. Alphabets eventually spread even to barbarian Northern Europe where one form, known as the "Futhorc," is obviously based on Roman letters. But the ciphers of many other European barbarian alphabets show no relationship to known letter forms at all, demonstrating that it was the idea that was transmitted rather than the letters.

See especially H. W. F. Saggs, *Civilization before Greece and Rome* (1989), who lucidly describes writing (plus other topics) in Egypt, Mesopotamia, and Canaan.

[\[return to text\]](#)

Note 7 --

"Ideas such as objectified conceptions of a mind, or even the notion of something spiritual being manifested, are of much later development. It is generally agreed that the ancient Egyptian language, like the Sumerian, was concrete from first to last. To maintain that it is expressing abstract thoughts would seem to me an intrusion of the modern idea that men have always been the same."

-- Julian Jaynes *The Origins of Consciousness in the Breakdown of the Bicameral Mind* (1976)

[\[return to text\]](#)

Note 8 --

There are disadvantages also. We are so easily convinced of the validity of our metaphorical thinking, that we end up fooling ourselves.

*"It is one of the lessons of logic, dutifully repeated in its textbooks, that 'analogy is not proof.' But to humans of all times, analogy **must be** proof. The most marvelous sense of power, intellectually and behaviorally, comes from the association of the tiniest events and observations with the nature and conduct of the great universe."*

-- Alfred de Grazia, *Homo Schizo, Human and Cultural Hologenesis* (1983?)

Another failing of speakers of Indo-European languages, and perhaps some other cultures

who are similarly inclined, is to jump to conclusions about causal connections simply because two events follow each other in time.

[\[return to text\]](#)

Note 9 --

See the chapter "Language and Causality," where this is more fully developed.

[\[return to text\]](#)

Note 10 --

I would suspect that the delay in subjective consciousness in this instance might largely be due to the limited exposure to new people. The Eastern Mediterranean, in contrast, was constantly overrun by foreign tribes seeking better environments, especially after both 1500 BC and 800 BC. The same was true of China.

Consciousness also insinuated itself for totally different reasons, dating from after 2000 BC (Jaynes suggests), as writing came into greater use. Trade would have been an immense influence (meeting different people), as would the increased use of scripts for state administration. Jaynes, in fact, claims that the use of the scripts of the "talking tablets" displaced the voice of a person to an object, driving spoken commands into silence, and requiring the reader to listen to the tablet, rather than imagining a person dictating the text. The communications of Hammurabi (circa 1700 BC) to his distant government officials were addressed not to them, but to the tablets he wrote (in his own hand!)

[\[return to text\]](#)

Note 11 --

I wonder how much of a lack of *subjective consciousness* existed among the world's foraging populations, or if it had already developed. Hunters are required to be smarter than farmers. They need to previsualize their quarry, understand their habits, walk their territory, and plot a catch. That requires a lot more mental space than the rote repetition of wielding a hoe. This would suggest, in turn, that the God-obsessed farming populations were more prone to remain pre-conscious. However, in a previous chapter I have applied a pre-conscious condition to the Western European Cro-Magnon cave painters (and hunters) as a reasonable explanation of why nothing changed in their depiction technique for 30,000 years.

[\[return to text\]](#)

Note 12 --

We do remember the physical spaces that we learn to navigate as a child, the people we deal with, and thousands of other details which become assigned to near-automatic behavior. This is mainly a right brain function.

[\[return to text\]](#)

Note 13 --

"This process by which the early gods reappear in later legends under human or semihuman form ... can be observed in many parts of the world, notably in India and Scandinavia. There is no question of historical characters being invested with divinity. A detailed examination of all ancient religions, not to mention new ones, ... shows that the Gods were originally more abstract and general forces which gradually degenerated and became anthropomorphic or zoomorphic"

-- Jean Markale *The Celts, Uncovering the Mythic and Historic Origins of Western Culture* (1978)

I would argue against the "abstract and general forces" and insist that the gods were instantly recognized as giant supernatural beings (and thus in a manner anthropomorphized), and only assumed human dimensions at a later date after they disappeared from view.

It seems likely that the predilection of our ancestors (and "primitives") for colorful decorations of bright bird feathers and oversized or outlandish headdresses reflects the colorful auroral plasma displays surrounding Saturn when he stood above the pole, as well as the plume-like headgear worn by planets in glow mode plasma displays. The same would be true of the crowns of kings and the halos of saints.

[\[return to text\]](#)

Note 14 --

The note about Sahagún is from Charles Mann, 1491, *New Revelations of the Americas before Columbus* (2006). Mann uses this to demonstrate that the Aztec were hardly "savages." The Aztec philosophers, by the way, seem to have bested the Spanish in the discussions. Admittedly, a complex theology is not sufficient to suggest subjective consciousness, for we see the same in Egypt of the Old Kingdom and Middle Kingdom before 1500 BC. The status of consciousness ought to be sought in the accommodation of the Aztec to the religious environment of the Central Mexican region, which they invaded 200 years before the Spanish arrived, and their subsequent relationship to the Spanish. This should be considered, despite the fact that their relationship to the Gods was one of control (which reflected also in their relationship with other tribes) rather than the Mediterranean concept of having to placate the Gods.

Linda Schele and David Freidel, in *Maya Cosmos* (1993) attribute the collapse of the Maya in AD 900 to internecine warfare, not to a religious collapse (which would be an index of the lack of subjective consciousness), as Jaynes suggested 30 years ago, based on limited information available to Jaynes at that time. Similarly the destruction of ceremonial sites in the Valley of Mexico was not always accomplished for religious reasons. Many centers were destroyed by marauding invaders.

However, it is important to emphasize that pre-conscious people are almost indistinguishable from subjectively conscious people, and the only real hint pointing to a lack of subjective consciousness is the inability to deal with new situations. This was not true of the Maya and the Mexicans at the time of the Spanish invasion, but I will go with Jaynes's opinion in the case of the Inca empire, although this is influenced by my lack of knowledge of the specifics of the change in South America from indigenous religions to Christianity. The Maya and Mexica, on the other hand, seem to have integrated local traditions (or, more importantly, their philosophy) and Christianity very rapidly.

[\[return to text\]](#)

Note 15 --

See Julian Jaynes, *The Origin of Consciousness in the Breakdown of the Bicameral Mind* (1976), for additional details.

[\[return to text\]](#)

Note 16 --

The belief by Mesoamerican cultures in an afterlife at the time of the invasion is now disputed. See Charles Mann, 1491, *New Revelations of the Americas before Columbus* (2006). The ceremonial centers serviced the elite and the states. Instead of benefiting the population by supplying promises of an afterlife, the benefit was reaped in earthly terms --

good harvests, long life, many children -- through the intervention with the Gods by the ceremonial chiefs. When these were not forthcoming, the population would abandon the ceremonial centers at the drop of a hat.

[\[return to text\]](#)

Note 17 --

It is amazing that in Mesopotamia kingship and trade remained secular in most respects. The Kings were only infrequently promoted to the status of Gods, unlike Egypt, and the relationship of traders to the temple enterprises is not clear at all. The trade also supplied the elite with luxury materials. This condition arose from the fact that Sumer has no natural resources outside of agricultural products.

We have no clear indication of "temple economies" in China, since there are no accounting records on clay as in Mesopotamia or testimonials carved in stone as in Egypt. But there was an economy based on supplying the elite of the very large imperial court, the provincial governors and their staff, as well as the armies, with food and luxury goods.

[\[return to text\]](#)

Note 18 --

The Maya never supported standing armies, or a police force.

I disagree with Jaynes's contention that "authority" was needed to "control" groups of people through leadership, especially large groups. A look at the Plains Indians shows this is not so. See, for instance, Robert Utley, *The Lance and the Shield, The life and Times of Sitting Bull* (1993) or see Linda Schele and David Freidel, *A Forest of Kings* (1990) on the Maya. The need for authority is necessary to gregarious species, like us humans. But it need not be a matter of imposed control, and all indications from graves and houses before 3100 BC in Egypt and the Near East is that there was no leadership elite.

[\[return to text\]](#)

Note 19 --

Jaynes admits that perhaps people whose role was closest to the upper levels of leadership would be most under the influence of the hallucinating voices of the Gods.

It should be remembered that the concept of "free will" does not develop philosophically until the Classical Age of Greece and the concept of "chance" remains forbidden well past the Middle Ages of Europe.

Even today we see, as an example, that "moral development" -- a term designating the ability to make independent ethical judgments -- correlates inversely with religiosity, a belief in the importance of law, and in general with conservative beliefs. See Lee Wilkins *The Moral*

Media: How Journalists Reason About Ethics (2005).

[\[return to text\]](#)

Note 20 --

Among the conditions for a plasma contact between Venus and Earth is the geometry of a transit of the Sun. Today the transits of Venus (when it moves across the face of the Sun) happen 4 times on a cycle of 243 years, in two sets of two transits, which are 8 years apart. The interval between the sets of pairs alternates between 121.5 and 105.5 years.

The use of a 52-year period (and the date of 2193 BC) is from Timo Niroma (at [\[personal.eunet.fi/pp/tilmari\]](http://personal.eunet.fi/pp/tilmari)), which fits well with a number of other suppositions. It is perhaps a lucky guess, but it works out well.

As I will show in Appendix B, "Celestial Mechanics," the 52-year period was in effect at this time, but not at a later date, even though invoked by Velikovsky and by some other catastrophists for other time periods. This certainty about a 52-year interval is largely derived from the continued observance in Mesoamerica of 52-year intervals, but these intervals are based on the Maya calendar system based on "Tun" years, not solar years.

Book 10 of the Maya *Chilam Balam* infers seven approaches by Venus since 3147 BC. I can easily locate four of these to 2349 BC, 1492 BC, 1440 BC, and an appearance which looked like a "close approach" in 776 BC. Considering the 156-year span of time between the "flood of Noah" in 2349 BC and the 2193 BC agricultural failure of Akkad, Egypt, China, and probably Harappa, the remaining three approaches by Venus could then be placed after 2349 BC at 2297, 2245, and 2193 BC with some confidence.

[\[return to text\]](#)

Note 21 --

Venus would seem to approach Earth every 52 years during this period, but was unlikely to have looked all that large except for its coma. For an electric interaction Venus would have to line up with the Sun on the day side of Earth, but likely never got closer than 10,000,000 or 20,000,000 miles. I'll provide estimates in the next chapter.

[\[return to text\]](#)

Note 22 --

More and more climatological and archaeological data has come forward over the years to establish a flood event, or some catastrophe, circa 2350 BC, as global in scope. This is influenced by Western Christian traditions, which hold to "the flood" as dated by Ussher to 2349 BC. The climatological decline after 2200 BC (2193 BC) is actually much better established, and the greater political consequences of this later event can be verified from Egyptian and Mesopotamian sources.

"... Most sites in Greece (circa 260), Anatolia (circa 350), the Levant (circa 200), Mesopotamia (circa 30), the Indian subcontinent (circa 230), China (circa 20), Persia/Afghanistan (circa 50), Iberia (circa 70) which collapsed at around 2200 +/-200 BC, exhibit unambiguous signs of natural calamities and/or rapid abandonment. The proxy data detected in the marine, terrestrial, biological and archaeological records point to sudden ecological, climatic and social upheavals which appear to coincide with simultaneous sea- and lake-level changes, increased levels of seismic activity and widespread flood/tsunami disasters. The main problem in interconnecting this vast amount of data chronologically is the application of incoherent and imprecise dating methods in different areas of geological and climatological research."

-- Benny Peiser, SIS Cambridge Conference (1997).

Peiser is hedging his bets here to cover both 2349 BC and 2193 BC by suggesting a range of from 2400 to 2000 BC. A few others have been more courageous and defined separate events for 2349 BC (the date is from Ussher) and the event 156 years later which resulted in a 200-year worldwide hiatus in agricultural production and abandonment of sites, apparently due to a notable lack of light.

We don't really know what happened, but the clues point to an alignment with Venus. On the other hand, Timo Niroma seems to think that the first flood was very localized, suggesting that a bolide fell in the region of the Dead Sea in 2349 BC. That might have devastated lower Mesopotamia, leaving Northern Mesopotamia intact, and allowed for the takeover of those lands by the Akkadians shortly after 2349 BC. But I doubt the local nature for this event.

I think the date and the cause are both incorrect. The cause for the devastation of the Dead Sea region (Sodom and Gomorrah) is a close contact by Mars. The date is 1936 BC and after. This information is developed in another chapter.

A book by Moe Mandelkehr, *The 2300 BC Event* (2006), in three volumes, similarly presents archaeological data spanning the continents, but, again, with peculiar absences of a record from Egypt and Mesopotamia. Mandelkehr also lumps data to a single date, 2300 BC. Mandelkehr blames the destruction on a massive meteor strike. More on this in the next chapter.

[\[return to text\]](#)

Note 23 --

The first Chinese chronicles recall the efforts of two early Emperors (or gods), Yao (Yâo) and Shun, in undoing the damage of a massive flood. This is the only flood reference in Chinese literature or later "legends." Chinese scholars circa 200 BC date these two legendary figures, which represent the last two in a series of ten "legendary emperors" (or Gods) to circa 2350 to 2200 BC.

James Legge, in his introduction to the translation of *The Shu King* (1879), absolutely insists that "Ti" (Tî), as in "Yao Ti," be translated as "God," not as "Emperor." He also reviews the slim literary threads which place the start of the reigns of Yao and Shun in circa 2350 BC.

[\[return to text\]](#)

Note 24 --

The parallels between the ten generations after Adam and the twenty early Sumerian and Egyptian kings and pharaohs (which can be equated with the ten appearances of Mars at approximate 30-year intervals) is a clear indication that we are not dealing with derivative sources. A notable parallel is that the 10 patriarchs born between Noah and Abraham are all (except the first and last) sired when their father was 29, 30, 32, or 35 years old. See Appendix A, "Chronology" for further considerations.

Other Middle Eastern influences have been noted in the composition of the Bible, especially the literature of the Canaanite city of Ugarit after 1500 BC. Additionally, there are very clear Egyptian influences, especially in Genesis.

[\[return to text\]](#)

Note 25 --

The other notable compiler of ancient history is Isaac Newton. The Saturnian people (of Thunderbolts.info) have steadfastly avoided bringing the Bible into discussion. I find this a remarkable omission.

[\[return to text\]](#)

Note 26 --

The Egyptian "Intermediate Period" between the Old Kingdom and the Middle Kingdom, is variously estimated at 185 years by Manetho (circa 300 BC), 315 years by Breasted (1905), 141 years by Clayton (1994), and 110 years by Lehner (1997). It is obvious from these disparate estimates that the dates are not well established. Today the start of the Intermediate Period is dated to 2160 BC with some confidence. This is 33 years after the event of 2193 BC.

[\[return to text\]](#)

Note 27 --

Mohenjo-Daro and hundreds of other cities in the Pakistan plain of the Indus river and the parallel dried-up river Sarasvati are totally abandoned after 1900 BC as the region had turned into a desert. It is suspected, however, that the Sarasvati river may be "mythical," that is, that it represented the "river" descending from Saturn during the "Era of the Gods."

The *Oera Linda*, a medieval book claiming to be the history of the Friesian people, calculates 2194 BC as the date of the sudden sinking of At-land -- the area between England and Holland. At the 7000 square miles of the Dogger Banks, off the coast of England, the stumps of trees are still dredged up from a depth of 50 to 100 feet (15 to 30 meters), along with mammoth tusks. The sinking of the area probably resulted from the uplift of Norway as the Ice Age glaciers melted, resulting in a sinking of adjacent regions, including the North Sea, which had been lifted up as the ice had depressed Norway. Geologically this event is located late in the Upper Paleolithic, but a subsidence at a much later date is also plausible.

The *Oera Linda* is suspected of being a hoax in the service of Frisian nationalism, revisionist history of antiquity, and promoting a species of feminism. Arguments against its authenticity are primarily linguistically based, but at times are as arcane as the accusation that the year tallies ignore a "year zero" and thus the sinking of Atland is off by one year from 2193 BC. Of course "At-land" is readily equated by others with Plato's didactic exemplary land of "Atlantis."

The date of 2193 or 2194 BC is not listed as significant by Ussher in AD 1650 or even encoded among other accepted but erroneous biblical dates by Josephus in AD 100. Dates like this did not come forward in the 18th through most of the 20th century, when Egyptian dynasties were still equated with the temporally dislocated Mycenaean occupation of Greece.

Although there were archaeological papers earlier in the 20th century. As far as I can tell, the first to settle on this date was Timo Niroma at his site [\[personal.eunet.fi/pp/tilmari\]](http://personal.eunet.fi/pp/tilmari). He quotes H. Weiss, *The Sciences* (May/June 1996), about the Akkadian empire of Sargon:

"Then, abruptly, things fell apart. Sometime around 2200 BC seasonal rains became scarce, and withering storms replaced them."

A number of people writing in documents published by the SIS [www.knowledge.co.uk/sis] came to the same conclusions in the 1990s. But all of them retained tentative dates, like "around 2200 BC."

On the other hand, what I did was to apply Velikovsky's suggestion of a 52-year period for Venus (although he never reached as far back as 2200 BC), assumed the actual date was 2193 BC, and validated this with an arcane reference from Maya calendar information. I then applied the date also to the fall of Egypt after the 6th dynasty (the Old Kingdom). I should point out that this date also easily fits alterations in the Mesoamerican calendar.

My adopted date of 2193 BC is thus based almost entirely on common sense rather than documents and ancient testimony, and thus one of my least well supported.

Niroma also extended the start of the worldwide drought to the Indus Valley and the cessation of the Harappan civilization. And applied it to the fall of the Old Kingdom. This was a very large step for Niroma to take, far beyond the endless pussy-footing of Egyptologists and archaeologists (or SIS people), but once taken, it makes perfect sense and fits worldwide data. Niroma concludes:

"My hypothesis is that there were two events, the first one around 2350 BC (2345 BC?), and the second one around 2200 BC (2193-2194 BC?), of similar cause, but possibly independent of each other."

How did the *Oera Linda* arrive at a date of 2193 BC? Wikipedia reports:

"It [the Oera Linda] also mentions Atland (the name given to Atlantis by the 17th century scholar Olof Rudbeck), which was supposedly submerged in 2193 BC, the same year as 19th century Dutch and Frisian almanacs, following traditional Biblical chronology, gave for Noah's flood."

Wikipedia might be in error here. Why this almanac date is off by 156 years from the date published by Ussher in AD 1650 for the flood of Noah, I do not know. As a fake document, the *Oera Linda* dates from the middle of the 19th century AD.

[\[return to text\]](#)

Note 28 --

The Chinese *Annals of Shu* hold that Shun, the Moon, dies in 2205 BC, that is, he "dies and goes on high." The date was estimated by chroniclers of the Han dynasty (200 BC) and should probably be 2193 BC, applying a uniform correction to the Han dates (see later text). The action is an increase in the period of the Moon which would have accompanied an increase in the orbit of the Earth also. I'll expand on this in a later chapter.

The Flood Reconsidered

The shock of the disturbance of 2349 BC was entirely equivalent to the shock of 10,900 BC in North America, except that it was on a smaller scale. So I will not repeat the order of events involved here, details of which are, at any rate, to be found in Appendix B, "The Celestial Mechanics." There were differences. A different planet was involved, the latitude of the impact was lower in 2349 BC, the tilt of the earth was less, the direction of the leading edge of the impact area was different, and the high plateau where the mountains were removed was wider.

Most significant was the fact that there was no lightning strike to the Earth's surface, but instead a plasmoid traveling from Venus impacted the Absu, rather than the Earth's surface. No massive forest fires were started, and no nanometer dust levitated into the stratosphere to cause hundreds or a thousand years of shadow.

I think the "flood of Noah" never happened. At least, not on Earth as a flood, although certainly Earth sustained water damage from rain, storms, and hurricanes. I suspect that what was thought to be the "flood" by everyone was, in fact, the disintegration of the Absu, the rings surrounding the Earth -- which in antiquity was universally understood to be an ocean.

That the Absu (or the Egyptian Duat, or the Maya "House of Nine Bushes") was real, I have no doubt. The rings of Saturn had been seen since the invention of the telescope. Then, in the 1990s, as space probes approached Jupiter, rings were found, like the rings of Saturn, but fainter. Then rings were discovered for Uranus and Neptune also. All four planets have magnetic fields. So does the Earth.

Venus, the Moon, and Mars do not have magnetic fields and do not have rings. Mercury also does not have rings, probably because it has only a very weak magnetic field. Astronomers

think that the rings of Jupiter, Uranus, and Neptune are fading and that the rings of Saturn will also fade over time. Saturn, which has the brightest and most extensive rings, is, however, a very electrically active planet. At closer distances, as reported by NASA in the 1980s, the rings of Saturn were seen to be composed of "spokes, braids, waves ... and spiral shapes." Twenty years later, in AD 2000 to 2008, during a less active period of the Sun, they have smoothed out. [\[note 1\]](#)

When the Mesopotamians start mapping the sky, they name the southern section of the sky, below the equatorial, "the path of Ea." Ea is the Babylonian God of the waters, the Akkadian god of the Absu. He is the Sumerian Enki, also God of the Absu. In Akkadian "Ea" is written with the Sumerian glyphs "EN.KI" -- "water house." "En" translates as "home," "house," or "temple." Houses in Sumer were initially constructed of reeds and with semi-circular (domed) roofs. This is what was seen in the south, a dome of reeds extending from the east to the west, located somewhat below the level of the equatorial in the sky, but with all the rings or sections of rings coming together at the east and west cardinal compass point. There is no question about the location of the Absu. [\[note 2\]](#)

It is certain that the Earth had rings, that they were clearly visible in the southern hemisphere of the sky (from a northern vantage point), and that the rings included constantly moving "spokes, braids, waves, and spiral shapes." The Egyptians also called the Duat "a field of rushes." It might have looked to them like marshland.

It certainly would also have looked like a sea, especially to people who lived some distance from the world's real oceans. In the Yucatan, closely surrounded on three sides by real oceans, the Maya were not fooled, however. The rings also stood 10 degrees higher in the sky as seen from the Yucatan, reaching to about 60 degrees up from the southern horizon. It was a celestial house instead, a "house of bushes" created by the Gods.

China, at about 35 to 40 degrees latitude, would have seen the rings stand about 50 degrees up from the southern horizon. China, like most locations further north than Egypt and Sumer, reported 9 rings. [\[note 3\]](#)

The Earth's clouds, rising from rivers and forests at dawn, could be seen passing in front of the Absu. That alone would be enough to make the Absu look like a real and solid object and as an extension of the land at the horizon. When the clouds passed, the Absu was still there.

Because of the way the rings merged at the horizon in the east and west, they are often represented as a 7-headed or 9-headed serpent. The heads of this snake were caused by the shadow of the Earth extending completely from the southern horizon to beyond the highest rings. This only happened at the time of the equinoxes. The penumbra of the Earth's shadow would make the gap wider at the top.

There are similar notions from Mesoamerica, where the rings stood considerably higher in the sky, that "the world" constituted a flat plane (a gap) between two giant step-pyramids.

This was the view at the time of the year near the equinoxes. At or near the equinoxes, the view of the separate rings, each higher one in the sky ending at a distance further from the center of the gap, would certainly have made it look like the gap was bordered by two step-pyramids or inclines. Mesoamerican ballcourts almost always are built as 6 steps, but also as just a sloped plane.

It is obvious that many of the spells from the Egyptian *Book of the Dead* (first recorded as tomb texts in 2345 BC), which guaranteed entry to the afterlife for the dead, are better explained if referenced to the image of the Egyptian Duat rather than the Saturnian polar apparition before 3147 BC.

Most obvious are many spells dealing with travel in the ship of Ra. The spells were written and augmented over a period of more than 3000 years (and the imagery certainly dates back as far as 8347 BC). Some of the earliest spells speak of a crescent ship traveling around the "river" at the edge of the globe of Saturn in the north sky. But after the breakup of the Polar Configuration in 3147 BC, the planet Gods were seen to travel along the river of the southern sky. Ships were still required.

The gods and planets identified with the Egyptians continue to travel by boat for the next 3000 years, as they do nearly everywhere in the world. In Egypt the temple Gods are ferried up and down the Nile to visit Gods at other temples. Statues were carried in ships to be dragged in processions. The spells still speak of ships, but after 3147 BC the journey is no longer along the blazing circular river at the circumference of Saturn, but along the river of the ecliptic and the edge of the sea in the southern sky.

One phenomenon which is clearly difficult to associate with the polar apparition in the north is the "door to the underworld." But it is readily explained by the shadow of the Earth moving from east to west across the Duat every night. The Earth is illuminated by the Sun at an angle to the equatorial which varies with the time of the year. During most of the year, except at the time of the equinoxes, the shadow would have looked like an arched doorway (referred to in one spell from the *Book of the Dead* as a cave). In between the times of summer and winter, the shadow would have progressively lengthened to become infinite at the time of the equinoxes. [\[note 4\]](#)

When the shadow fell all the way across the rings and formed a gap, it would have been more or less shaped like an inverted trapezoid. The gap at the top would widen with the distance from Earth, since the penumbra of the Earth's shadow widens with distance. The "half shadow" of the penumbra would have considerable density since it is located relatively close to Earth (unlike in a lunar eclipse, where the penumbra is markedly faint). But it would also decrease in darkness with distance, so that at a considerable distance above the Earth it would have fallen off noticeably.

During the day the Sun would have lighted the Absu from behind. The Sun would travel above the equatorial circles during most of the year, but would shine through the Absu in the

winter months. I have no idea what the effect would be exactly. It might not have looked different from today's Sun located behind a haze. In that the Sun is the largest and brightest object in the sky, it would be certain that during the winter months the image of the Sun would be preceded and followed by other amorphous forms, which would show local motion because they were imbedded in the equatorial rings which moved incessantly. Today, during dusty atmospheric conditions, these show up and are called sun dogs. In antiquity they were held to be the horses of the Sun. In the 13th-century Icelandic *Prose Edda* the forms which follow are held to be wolves chasing the Sun. Even nearly 2000 years after the Absu had disappeared, the horses of the Sun remain in place: in 685 BC it is Phaethon who loses control of the horses of the Sun.

[Image: Sun dog images, Fargo North Dakota.
After Wikipedia. Note the start of a circular form.]

Seen from the southern hemisphere, the Absu would have looked the same as in the lands of the Eastern Mediterranean, Mesoamerica, North America, and Asia, except that the rings would have been placed above the north horizon. In Peru (for example, at Lima) the rings would have stood up at an angle of 60 or 70 degrees from the north horizon. The existence of the Earth's shadow on the rings might be acknowledged in the U-shaped ceremonial centers which dot the countryside in the deserts, and which date back to circa 2500 BC.

To recap: every night a gap appeared in which the rings were not visible, and which moved from the east to the west. The Egyptians called it "Naarutf." *"The meaning of the word is 'it never sprouteth',"* wrote E. A. Budge (1895), *"and is defined as 'a section or door of the Duat which lies to the north of Re-stau.'"*

"It never sprouteth" indicates the missing image of spokes and "rushes" which "grew" everywhere else where the shadow did not fall. "Re-stau" originally was the cemetery at Abydos, and came to mean, wrote E. A. Budge, *"the passages in the tomb which lead from this to the other world"*. The phrase in the paragraph above, "north of Re-stau (Abydos)," might also be rendered as "Abydos lies south of the Duat," and thus the "other world" was located beyond the doorway of the Duat. The view through this doorway was obscured, for although some bright stars (and planets) would have shimmered through the unlit portion of the rings, the dust and gases of the ring would have blocked most starlight from passing

through. (Sirius and Canopus, the two brightest stars were noted exceptions. See a later chapter on the effect of seeing both of these stars, one above the other.)

The concept of a doorway is completed when it is realized that when the shadow took on its longest shape at the equinoxes, and extended beyond the end of the rings, the shadowed gap would be capped by a lintel -- a beam -- stretching across the shadowed portions of the Duat and extending beyond it to the east and the west (although at an angle). This is the bright "path of the Gods" -- the ecliptic -- so far removed from Earth that the shadow could not reach it. This might be reflected in the post and beam gates seen as freestanding structures in China and Japan. But of course to the people of Earth the ecliptic was no further away than the edge of the rings. [\[note 5\]](#)

Near the time of the equinoxes, the east and west edges of the shadow, the penumbra, the partially lighted area surrounding the dark full shadow of the Earth, would have fallen on the rings. This would be an area which widened with the distance from the Earth, and became fainter further from Earth. Seen from Earth this would constitute an edge which bent away from the center, thus making all of the Duat look more like two mountains with a valley in between. [\[note 6\]](#)

There is a lack of early Egyptian visual references to the Duat or the doorway to the Duat. Perhaps this is because the spectacle in the sky never varied or showed any activity and came to a sudden end in 2349 BC. Later depictions of the sun god Re, however, frequently show disembodied arms extending up from a baseline (representing the horizon) to the red disk representing Re. These might be representations of the penumbra seen at the edges of the "doorway" shadow (although I doubt that). Two arms extending up from a baseline is the hieroglyphic for "ka" also, the meaning of which might be translated as "soul."

Late depictions in the New Kingdom show Ra as a huge red ball suspended in a valley between two mountains (or what looks like mountains). Tomb texts place the uplifted arms in the south, in the Duat, "The Aten [the globe of Re] is in the Tuat [Duat]. The arms of the Mysterious Face come out and lift it up." I have wondered if this last is a reference to the smiling face formed by the first ball plasmoid, where the arms would be two of the lines of electrons. This was something which could only have been seen two thousand years earlier by people close enough to the equator to get an unobscured view beyond the equatorial rings. (The snake-haired smiling face shows up regularly in Australia and South America where a clear view would be had. The Egyptians originated from Ethiopia, where the face of the southern ball plasmoid might have been seen clearly.)

Since the doorway moved from the east to the west, it was the west which became the location of the underworld, as Budge explained, about the Duat:

"... it must be distinctly understood that the Egyptian word does not imply that it was situated under our world, and that this rendering is only adopted because the exact significance of the name Duat is unknown. The word is a very old one, and expresses a

conception which was originated by the primitive Egyptians, and was probably known to their later descendants, who used the word without troubling to define its exact meaning"

One of the spells of the "Book of the Dead" is titled:

- Chapter XCIII. The Chapter of not sailing to the east in the underworld.

Sailing to the east over the sea of the Duat (or possibly the river of the ecliptic) would result in missing the entrance to the "Land of Life," which was in the west. Almost uniformly all the Egyptian graves were located west of the Nile in the western desert.

If the shadow on the rings was understood as a doorway, then we would also expect references to a doorway among the spells of the "Book of the Dead," and as a matter of fact, these exist, as in the following examples (I have only listed their titles):

- Chapter LXVII. The Chapter of opening the doors of the tuat [Duat] and of coming forth by day.
- Chapter CVII. The Chapter of going into, and of coming forth from, the gate of the gods of the west among the followers of the god, and of knowing the souls of Amentet.
- Chapter CLXI. The Chapter of the opening of the doors of heaven by Thoth, etc.
- Chapter CLXXIV. The Chapter of causing the khu to come forth from the great gate of heaven.

And, from the *Papyrus Ani*, a hymn pointing to the travels of Re through the skies:

- Chapter XV. A hymn of praise to Ra when he riseth in the eastern sky, and when he setteth in the [land of] life.

This again points out that Ra (Re), the chief God whose worship had started sometime after the close of the "Era of the Gods," was always first seen in the east after an absence from the south skies of many months. This is Jupiter with a lower coma tail, it is not Ra as Saturn when he stood still at the North Pole, nor is it the Sun. Jupiter would, after the course of some months, disappear again (or reduce in size) in the west. The "land of life" was located in the west, the location to which the rings, the doorway, and Re moved. [\[note 7\]](#)

The Fall of the Absu

What happened to the Sumerian Absu, the sweetwater ocean which had spanned all of the southern skies? There seems to be no unequivocal notice about its disappearance. That may be because it was so gradual as to be unremarkable, or to have transformed into something altogether different. As likely, we cannot read the references to it, couched, as they are, in language not at all familiar to us. The Absu is obviously gone by 2200 BC. In the Babylonian *Enuma Elish*, written somewhat later (probably after 1800 BC), the Absu has become deified

as a God to become an actor in a narrative of the creation of the world.

Let me suggest that the Absu disappeared suddenly, in 2349 BC, perhaps in a matter of days, because of an electric interaction with Venus and a temporary change in the tilt of the Earth's axis. At the same time the Earth moved further away from the Sun and to the established orbital path of the Moon.

Moved further from the Sun, to a new location of lower potential in the electric field of the Sun, the Earth would have started discharging to the surrounding space. Such a discharge would normally be very slow, in dark mode (except at the poles), and lasting hundreds of years. However, the disruption caused by Venus was rapid, with the nearby Moon perhaps providing an additional electrical path into the space facing away from the Sun.

If we can give any credence to some of the "flood stories," the Absu fell in a few days. The fall was also probably rapid because the contact by Venus caused radical changes in the electric field which kept the rings suspended. The electric repulsive impulse force from Venus seems to have struck in the northern hemisphere in Asia north of India -- north of the Himalayas in Tibet.

The Himalayas at the edge of the northern border of India (Kashmir, Nepal, Bhutan) form a circular arc some 1,600 miles long (2,500 km), which has all the looks of a compression shock. Similar semicircular arcs of compressed mountains exist in Mongolia, Iran, and the continental USA.

Typical of the fact that the Earth would have kept rotating (while tilting away from the Sun), the opposite arc is missing. This is unlike the Moon's Orientale basin, or the Caloris basin of Mercury, which are also clearly compression shock sites, but of planets which rotated only slowly. [\[note 8\]](#)

[Image: Himalayan Mountains between India and China. After imgarcade.com.]

As a result of the sudden repulsive shock, the axis of the Earth went into a swing, with the northern part initially moving away from the direction of the Sun. The equatorial rings would have swung up at a steep angle to the Earth's orbital plane, placing them directly between Venus and Earth (as the Earth kept rotating).

The main disturbance of the rings came with the arrival of a plasmoid thunderbolt -- a disconnected electric arc -- from Venus. The particles, gases, and ionized atoms held in suspension in the Absu were disturbed or neutralized and departed when the plasmoid from Venus arrived and slammed into the Absu.

The Absu turned red and then disappeared except for one remaining ring. It looked like the arrival of a dragon which smashed into the rings. The untold billions of electrons arriving and smashing into the rings of the Absu would have neutralized most of the ionized gases and particulate matter. The dragon bled for three days. The "blood" seen in the sky could have been constituted by the ionization of any number of diffuse common atmospheric gases.

Much of the coulomb charge of the Earth is normally tied up in the toroidal belts of the magnetosphere at the equator. This is the source of hurricanes -- when this belt arcs over to the atmosphere in the tropics. I would expect the "discharge" of the Earth to have happened in both directions, towards Earth from the rings and out to space via the Moon. The arrival of the plasmoid would disrupt the rings by neutralizing the electrostatically suspended particulate matter and also by altering the electric field of the Earth which held the particles

suspended above the equator.

The loss of the electric charge of the Earth might have been sufficient to have destroyed the Absu. The particulate matter could no longer be suspended in rings around the Earth. It fell in or moved out to space. We can assume that much of the particulate matter simply drifted down to Earth, and that larger rock-sized chunks (if any) started to move away from Earth. This reflects the current thinking of NASA concerning what they foresee as the ultimate dispersal of the rings of Saturn (<http://photojournal.jpl.nasa.gov/> February 12, 2002).

... the snake Apep

As the gases and particulate matter moved away from Earth they would visually approach the equatorial, a plane directly above the Earth's equator, the far edge of which is seen as a circle in the sky located from directly east to directly west but set at an angle equal to the complement of the latitude (90 degrees less the viewing latitude). Visually, even as the dust and rocks kept moving ever further from Earth, it would never seem to move higher into the sky than the far location of the equatorial. Over time, as the distance from Earth continued to increase, it would simply disappear.

There remained, however, a last ring, at a considerable distance above the equator. This last ring might be equated with the lapis lazuli necklace of the Goddess Inanna, mounted up in the sky as a sign from the Gods to never again bring such a flood, except that the ring was red, not blue. It is the Uoroboros. It would, however, match the effect suggested in the Maya *Chilam Balam* which describes that, after the flood, the "roof beams" of the sky became visible -- the ecliptic and the last ring of the Absu below the equatorial, crossing each other at an angle. The ecliptic had not been seen earlier when it was behind the Absu.

The two rings rose in the night sky, surrounding the Earth. In the Yucatan the last ring of the Absu would be seen as standing very high up in the southern sky, stretching from directly east to directly west (but at an angle). The ecliptic consisted of a hoop which intersected the red equatorial ring at the two locations of the equinoxes. At that time the Pleiades stood above the intersection at the vernal equinox.

[Image: Bunyip, Australian water monster.
After "Illustrated Australian News " (circa 1890)]

The Earth still cast a shadow on the last upper ring of the Absu, but because of the increasing distance (the dust and particles of the red ring seem to have been located at about 6000 miles, 9,600 km, from Earth), the shadow would only show as the Earth approached the equinoxes. Then the shadow of the Earth, of the same width as previously at this location, would fall across the ring. The ring with this gap would look like a giant snake whose head moved up from the east and slid across the southern sky to the west each night, closely following its own tail. At other times of the year only the long body of the snake would be seen, since the shadow of Earth would not reach out far enough. [\[note 9\]](#)

The glowing band of the ecliptic would also be seen. The ecliptic crosses the equatorial at the location of the equinoxes. Since the Earth's shadow would not reach or be seen on the ecliptic, it would remain lighted where the shadow of Earth fell on the equatorial at the time of the equinoxes. The ecliptic thus looked like it passed in front of the red band below the equatorial -- certainly a confusing visual presentation, since we know that just the opposite is true.

In Maya iconography the crossing of the two sky bands is used in representing the sky or the sky band (the ecliptic), with a symbol known as the Saint Andrew's cross. This symbol is not simply an "X" figure, but always has one of the bars cross in front of the other. (The vernal equinox is designated by having the bar which starts at the top left pass in front of the other; the autumnal equinox reverses this.)

This last outer ring of the Absu lasted a long time, well into the current era. This last equatorial ring has entered mythologies worldwide as a celestial snake -- called Apep by the Egyptians and Apophis by the Greeks. It adds to the utter confusion of monsters, dragons, and serpents.

"Comparative investigation confirms that every well-documented culture possessed its own names and images of the serpent or dragon of chaos -- the monster whom the Babylonians called Tiamat, the Greeks knew as Typhon, and the Hindus called Vritra or Ahi. In Australia it was the Bunyip-monster, sometimes identified as the 'Rainbow Serpent,' that once decimated the earth. And in North America remarkably similar stories were told of the 'Great Horned Serpent.'"

-- David Talbott, *Thoth newsletter* (2002), draft text for the book *Thunderbolt of the Gods* (2005)

I cannot speak to the Australian Bunyip-monster, although it is said to lurk in swamps and waterholes -- an association, I presume, with the Absu. I find "Rainbow Serpent" quite revealing, not because of the implied coloration, but for the form of an arch across the sky. This would seem to be Apep of the Egyptians, except that the serpent has horns. This last feature would equate the Rainbow Serpent with a polar plume.

With the background of the historical sequence of events presented in this text, it will be recognized that the Babylonian Tiamat is Venus in 2349 BC, and the Greek Typhon is Venus in 1492 BC. Then, not included above, there is Phaethon, which can be placed in 685 BC as Mercury. These last three will be presented in later chapters. The "Great Horned Serpent" is distinct from all three of these. It is probably the north polar plasma plume which appeared each time the orbit of the Earth increased, complete with horns, as I have illustrated previously. Apep, on the other hand, is the last remaining ring of the Absu, also to be placed after 2349 BC, and remained in the sky into the current era, probably as late (I suspect) as AD 600.

Apep, in fact, does not appear in Egyptian mythology or depictions until after 2200 BC. It did not exist earlier, and since then was seldom noted because the red ring, like the Absu, never did anything significant except to color some bright stars. Spells to ward off the evils of Apep are only added to the *Book of the Dead* very late, as a matter of impressing the Greek (Ptolemaic) overlords after 300 BC. A chapter of spells in a papyrus dating from these times, called the *Book of overthrowing Apep, the Enemy of Ra, the Enemy of Un-Nefer* (Un-Nefer is Osiris), gives directions for:

"preventing storms, and dispersing rain-clouds, and removing any obstacle, animate or inanimate, which could prevent the rising of the sun in the morning, or obscure his light during the day," -- paraphrased by E. A. Budge, in *Legends of the Gods* (1912)

The Egyptians were at this time, after 300 BC, transferring the title of "Ra" to the daytime

Sun. (It was about time!) The Egyptians had also run out of visible celestial monsters, and thus promoted the Apep ring to the status of a vicious snake. He was depicted in Egyptian illustrations as pierced with knives to color him red with blood. This is quite alike to the Maya depiction, where the celestial snake has patches of flayed skin.

Near the dates of the equinoxes, the head of the snake would be seen nightly rising in the east as its tail disappeared in the sky in the west. It seemed to be chasing its own tail. As the year moved away from the time of the equinoxes, Apep would catch up to its tail and swallow it. The image of a snake swallowing its own tail, called the Uroboros, still appears among medieval alchemical documents. Of course it did not have a distinct head -- snakes do not have distinct heads. Among the later Maya it was merely a cord in the sky. [\[note 10\]](#)

In Ireland, St. Patrick, active to about AD 500, in legend drives Ireland's snakes into the sea. There never were any snakes in Ireland. But there was the celestial Apep which disappeared about that time.

Another story (legend) concerning St. Patrick and a snake is retold by Philip Coppens:

"The legend states that Patrick was drawn here [to Station Island] by the triple goddess Corra, a pagan goddess who apparently tried to reclaim Ireland to the pagan gods after Patrick's recent success at Croagh Patrick."

Croagh Patrick is a sacred mountain in Ireland, where St. Patrick stayed 40 days to prove the superiority of Christianity. You will recognize the "triple goddess" as the southern ball plasmoids appearing between 10,900 BC and 8347 BC, especially when she turns into a snake.

"On his flight - indeed - from Croagh Patrick, he looked down, and saw that she had taken the form of a serpent, lying in the water of Lough Derg - the Red Lake, though some recent authorities prefer to read Derg as a form of the Irish deirc, "the lake of the cave". Descending to investigate, she swallowed him whole. It took Patrick two days and two nights to cut himself free, killing her in the process. The water turned red with her blood and her body turned to stone, forming the islands in the lake."

-- from <http://www.philipcoppens.com/croaghpatrik.html>

The action retells the event of 2349 BC -- 2800 years later for Patrick, 4300 years later for Coppens. It includes the "two days and two nights" common to all the retellings, plus the "water" turning red with blood. The "Red Lake" is as appropriate to the event of 2349 BC as the "lake of the cave" is in signifying the Absu with its doorway.

The *Younger Edda* of circa AD 1200 relates, as one of the subjects (constructs) of bardic epic poetry, the disposition of one of Loki's evil children, Jormungand the Midgard-serpent, which Odin the Alfater threw into the ocean:

"When they came to him he threw the serpent into the deep sea which surrounds all lands. There waxed the serpent so that he lies in the midst of the ocean, surrounds all the earth, and bites his own tail."

The snake swallowing its own tail is Apep again.

From Alfred Tozzer, *A Comparative Study of the Mayas and the Lacandonas* (1907), from verbal sources, we have the following:

"... there was a road suspended in the sky, stretching from Tuloom and Coba [that is, the east] to Chich'en Itza [which is only halfway] and Uxmal [that is, the far west]. It was in the nature of a large rope supposed to be living and in the middle flowed blood. For some reason this rope vanished forever. This first epoch was separated from the second by a flood."

The above account is quoted by Schele and Freidel in *Maya Cosmos* (1993). This is a recollection of the lowland Maya (the Northern Yucatan). The road in the sky will be recognized as the last remaining ring of the Absu. The flowing blood, also, is an aspect of the last ring of the Absu, for it can be determined to be red from the look of Sirius before AD 950, among other things. The "flood" is the flood of 2349 BC, separating two eras, as mentioned in the quote above. The actual world flood of 3147 BC has no causal connection with the red rope, which happened at a much later date. But it was at the time of the celestial flood of 2349 BC that the red rope first appeared.

The story also reflects on the paved Maya road which was built in AD 800 to 850, between the city of Coba in the east and Yaxuna directly west of Coba, 62 miles long (84 km), and representing the largest construction project ever undertaken in the Yucatan. This is less than halfway the total distance from Coba to Uxmal. The industry and enthusiasm with which this project was undertaken may reflect the fact that the red road in the sky had recently disappeared. There are a number of other, much shorter, causeways like this, also running east-west (some are processional roads to outlying shrines). Schele and Freidel (in *A Forest of Kings*) think that this road, too, functioned as a processional way.

... the Falling Rings

As I have mentioned, the Moon was thought to have been seen since the remotest period in antiquity, but this was most likely the planet Jupiter seen at close quarters when fully lighted by the Sun. Thus, as presented with the sculptures of the Maya site of Palenque (AD 700), as well as in Hesiod's *Theogony* (circa 650 BC), the Moon precedes any of the Gods. She is the mother of all the gods.

The sudden clear appearance after 2349 BC probably made it look as if the Moon swept the Absu clean. But the Moon, although given credit for the cleanup after the flood (as the

Chinese Legendary Emperor, or God, Shun), could not have dispersed the rings physically, for the Moon today is 250,000 miles (400,000 km) away from Earth, and probably has always been on an orbit of 250,000 mile radius. The rings probably only reached, at most, about 8500 miles out.

Both the initial as well as the eventual dispersal of the equatorial rings was electrical. An outward dispersal, however, could have happened via the plasma tail of the Earth, which, even today, reaches well beyond the orbit of the Moon. But probably most of the contents of the Absu drifted down to the atmosphere below, and fell to Earth.

Charles Raspil, in an article "Spatters and Planetary Iconography" (*The Velikovskian*, 1994), details the recording of "spatters" from the middle of the second millennium BC through the 18th century AD. The spatters look like raindrops and rosettes, placed in artworks almost randomly surrounding depictions of gods or humans in any scenery.

Raspil identifies the spatters as astrological iconography, rather than to think of them as representing physical phenomena. But the spatters make more sense if understood as representations of minute dust particles drifting to Earth, carrying an electric charge from the far upper region of Earth. On nearing the surface of the Earth, the spatters would disintegrate electrically. This would suggest that dust from the Absu rained down for nearly 4000 years. If, as Raspil claims, the depiction of random spatters only started in the second millennium BC, then perhaps it was the change in the Earth's electric field after 1492 BC which made a difference. There is, however, little if any artwork from before even the first millennium BC to inspect.

[Image: Spatters. After Raspil.]

Raspil has made a career of finding strange anomalous forms interspersed with pictorial

forms in artworks dating from antiquity to the 18th century AD. The spatters seem like fillers of graphical space, but at the same time look as if they were objects regularly seen in the sky, or near ground level. He writes:

"In their portrayal of the spatter, artists distribute it randomly within the confines of any particular artwork. It is small, taking up little space within the borders of any particular opus, and is multiple, appearing in pluralities. Its random distribution and appearance, along with its nonuniform configuration, suggest that it is a natural phenomenon and not an artistic symbol."

"The basic spatter configuration consists of one large ringlet surrounded by many smaller ringlets (eight, usually). Variations exist: small square- or diamond-shaped ringlets may surround the central ringlet. On occasion, only a few nascent dots, not ringlets, will arrange themselves in significant patterns (patterns of spatters)."

Raspil illustrates a Rhodian plate (above) which highlights action from the Trojan War, and comments:

"Both the basic and more sophisticated spatters appear: the former to the immediate right of the first soldier's nose and between his legs, as well as above and on the second soldier's shield; the latter on the extreme right and left of each opponent, and in the centre of the diagram, between their two shields."

"The sophisticated spatters appear to be 'petaled.' Two of these spatters are cut off by the borders of the plate. If these spatters were symbolic, not natural, why would the artist cut them off and treat them as if they were mere background, like clouds in a photograph?"

This suggests dust particles falling to Earth, and igniting briefly in the blaze of plasma (a switch to glow mode or arc mode), as suddenly as firecrackers and perhaps with an explosive sound.

As Raspil points out, the spatters occur on all continents and with the graphics of all civilizations. Raspil traces the spatters into the 18th century AD, whereas I claim that the "snake" Apep disappeared before AD 800. But even though Apep was not seen, it is possible that the dispersal of dust to Earth's surface continued for another 1000 years.

... the Moon on Fire

Let me propose that the Moon, which joined Earth in 2349 BC, initially had an atmosphere, which caught fire a hundred and fifty years later in 2193 BC.

There are some disconnected Australian legends of the Moon alternately growing hair and trimming it. That would be the sight of the Moon's plasma tail seen from an angle from

Earth, and shortening as the angle between the Moon and the ecliptic changed throughout the year. There are also Greek and other references to a bearded Moon, which is the same image.

If the Moon initially had an atmosphere, it would likely have consisted of hydrogen, methane, carbon dioxide, and oxygen -- if it was at all like any of the other planets. That represents a condition which could ignite massive fires if any impinging plasma changed to arc mode on contact with the Moon. We will see this condition for Jupiter in 2150 BC, and for Mercury in 686 BC.

The Moon may have been very active electrically after it joined the Earth in a nearly equal orbit. But I would also suggest that if the Moon initially had an atmosphere then plasma strikes from Earth impacted in glow mode at the Moon -- which means that nothing of particular note was seen, and only a few scars remained behind.

I am proposing this because at some point, there is a spectacular fire at the Moon. Everyone noticed, and all peoples incorporated the fire into their tales and legends.

When might a fire have happened, and in what order? Probably not initially after 2349 BC (Noah's flood), because the Earth only moved further from the Sun, and thus had to increase its own negative charge. However, this was not the case for the Moon. Then in 2193 both the Earth and the Moon moved to a new location, and both would have been subjected to an influx of electrons. For the Earth this would have shown as polar plumes (at each pole), but nothing like that would have resulted for the Moon, which has no magnetic field.

The glow mode display might have stopped after 2283 BC (Palenque, corrected from 2305 BC) or 2285 BC (according to the *Annals of Shu*). The texts would suggest a sudden change from glow mode to arc mode, and therefore noticed by humans, which would account for the assigned dates.

At Palenque the Moon becomes ruler in 2283 BC; in China, Shun joins Yao on the throne in 2285 BC. These dates might reflect another electric contact with Venus, which would most likely have happened in 2297 BC, although 2297 BC falls 14 years short of 2283 BC.

Interestingly, the two clear "legends" of a fire at the Moon indicate that an event happened on a mountain. The mountain image associated with Mars between 3067 and 2750 BC consisted of a plasma stream extending from the Earth's ionosphere to the surface of Mars. The mountain of Jupiter was the plasma plume extending from below the lower hemisphere into space. The tower (rather than a mountain) associated with Mercury in 686 BC was plasma streaming from Earth to Mercury (to be presented in the next chapter).

A streaming of plasma from Earth to the Moon (like for Mars and Mercury) would be unlikely, since the electric conditions would not have existed. For a long time, like today, Earth and the Moon have been at nearly the same electric potential for the region exterior to the Sun where they both travel. It is more likely that the mountain shape is a plasma tail of

the Moon in glow mode, which it certainly would have had if an atmosphere still existed. The reason this was seen (and understood as a mountain) is because the nighttime Moon rises 5 degrees above the ecliptic, and thus the extension of its plasmasphere away from the Sun would have been visible from Earth.

After a fire on the Moon the plasma in glow mode would never again have been experienced. It has to be presumed that the remaining atmosphere would have disappeared over the course of the following thousands of years. Very little atmosphere is left today on Mercury after the planet fire of 686 BC. That was only 2600 years ago. Thus it would be unlikely that the Moon would show any atmosphere at all, because the fire happened 4300 years ago.

A planetwide fire would explain the Bible tale of Abraham who is told by God to sacrifice his son Isaac as a burnt offering on a mountaintop. His hand is stayed by God, and a ram is substituted. Isaac thus survived the fire; so did the Moon.

A parallel Chinese legend has it that Khwan, who was engaged by Yao to clear the inundation, was "sacrificed on a mountain" in a fire -- when he failed to accomplish his task of clearing away the waters of the flood. His son Yu rose from the ashes and completed the task. Han dynasty historians speculated that Yu was born in 2300 BC. Yu is assigned also as the first king of the Xia dynasty.

In both cases someone survived the fire. Actually, of course, it is the smaller bare Moon who is the survivor. That would also suggest that all the electric scars of the Moon date to after 2200 or 2100 BC.

The Moon possibly rotated when it first joined Earth, although the very circular look of Mare Orientale basin suggests this was not so. Ralph Juergens, in "Of the Moon and Mars," has suggested that the basins (on the front side) could have happened in a contact with Mars in the 8th century BC. It is possible that the craters on the back of the Moon were formed in 685 BC, when, like Venus and Mercury, Earth and its satellite probably also exploded in flames -- from the stratosphere or ionosphere for Earth, from the surface for the Moon. During the 40 day nova event of 685 BC, the Moon circled the Earth one and a quarter times. So craters would appear on all sides.

Within a few decades after first meeting in 2349 BC, the Earth and the Moon would have started to revolve around each other on more or less the same orbit around the Sun, as they do today. The motion of the Moon actually describes a path today which starts some 20,000 miles (32,000 km) above Earth and over the course of six months spirals to a location an equal distance below Earth, after which it reverses again. (It actually describes the figure of a cycloid, not a series of loops.) Moon eclipses only happen at a six-month interval, at the time when the Moon is passing from above the Earth to below, or in the reverse direction.

We can now also clarify the contemporary quotation from a Columbian source in the previous chapter:

"When the Moon did not yet exist, a bearded old man named Botschika taught the arts of agriculture, clothing, worship and politics to the people. His beautiful but malevolent wife was Huythaca. She caused a flood in which most people perished. Botschika then turned her into the Moon."

Now we realize why the Moon was held responsible for the flood; the Moon's flood is here confused with the flood of 3147 BC. The bearded old man can still be identified as Saturn. If, however, this quotation actually recalls details from the "celestial flood" of 2349 BC, then the bearded old man is Jupiter, with his mountain perhaps identified as a beard.

At the end of Book 2 of the Maya *Chilam Balam*, there is a short disconnected section which obviously recalls the event of the "flood of Noah." It includes the line:

"And the face of the sun was corroded, and its face became darkened and was put out. And then, above, they became frightened. 'It has burned up! Our god has died!' their priests said. And they were beginning to think about making a picture of the figure of the sun, when the earth shook and they saw the moon."

-- Antonio Mediz Bolio, *Books of the Chilam Balam of Chumayel* (1930)

The Moon was noticed. The shock may have referred to the contact with Venus, or it may indeed have represented the first touching of the Earth's plasmasphere and the plasmasphere of the Moon. The shock might account for an alteration in the orbit of the Moon which would start it circling around the Earth. [\[note 11\]](#)

It is possible that all of this is conjecture -- that the Moon never had an atmosphere. But the concept of a planet-wide fire is reinforced by the fact that Jupiter caught fire soon after the supposed fire on the Moon. The fire of the Moon I have here dated to 2205 BC, although it could as likely be in 2193 BC.

The fire at Jupiter I am dating (further below) to 2150 BC. Rockenbach, in *De Cometis Tractatus Novus Methodicus* (AD 1602), places this event in 2060 BC, a hundred years later, and identifies it as the Tower of Babel incident. The Tower of Babel event which was actually well remembered was the flaming up of Mercury in 686 BC.

The Flood from the Sky

There was no "flood of Noah" in terrestrial terms. It all happened in the heavens, although the destruction of the Absu must have caused violent hurricanes, storms, rains, and thunder -- certainly for weeks or months. And, not to be neglected, we should recognize the flattening and raising of the Tibetan Plateau, and the subsequent path of earthquakes and seismic destruction traced through the Eastern Mediterranean into North Africa. [\[note 12\]](#)

The seismic disturbances were experienced in 2349 BC as Venus started to pass Earth on an

inner orbit. As both Earth and Venus lined up with the Sun, the plasmaspheres would have touched, and suddenly the crust of the Earth would have experienced a repulsive force. The force would have been experienced on the hemisphere facing Venus, since the Earth's exterior surface distribution of electric charge in effect makes the interior of the Earth (and thus the other hemisphere) opaque to an electric field exterior to the Earth.

Because of the sudden onset, a stupendous seismic shock would have traveled around the world. At the location facing Venus, the crust would have been depressed, resulting in an uplift of the crust in adjacent areas. As the Earth continued to rotate, the region of the depression would have continued to move toward the southwest, although the force would very rapidly diminish as an opposing electric charge was induced at the facing sides of both planets.

The effect of the forces at the crust would be mechanically transmitted to the mass of the Earth, in a direction away from the Sun, thus relocating Earth to a different orbit.

Unlike gravitational forces, which act (equivalently) through the centerpoint of the Earth and therefore have no effect on the Earth's spin, if the electric forces were even slightly offset from the center, the Earth would have reacted like a gyroscope to the externally applied torque -- swinging the axis through a circle in response to a tilt in the Earth's axis.

Venus, because of the extremely heavy atmosphere which carries its electric charge, would react very differently, absorbing and distributing the repulsive forces around the planet. Venus's orbit might not be significantly affected. (I have expanded on this and added some approximate calculations in Appendix B, "The Celestial Mechanics.")

There are indications of undetermined catastrophes in this era in many locations in the world. I think these can be attributed to the earthquakes due to the initial electric repulsive shock (in central Asia) which traveled as a seismic wave around the Earth, plus a following attractive exterior force, applied as the Earth continued to rotate, which would have uplifted the surface in the next sector of Earth to come into alignment with Venus (Tibet). This was followed somewhat later by the arrival of a plasmoid lightning bolt from Venus (one large, nine smaller). It is this last which resulted in the hurricanes and torrential rains which have been identified as the Flood of Noah. [\[note 13\]](#)

But the crisis in religious concepts and the loss of a worldview was much more important and cannot be neglected. For a second time, the structure of the Universe had been radically altered. The removal of the Gods would be nearly complete when Jupiter, who had stood in the sky as the Midnight Sun, was permanently "taken away" 200 years later, in about 2150 BC.

As I noted in the previous chapter, sometime after about 2400 BC construction stopped on barrow graves and (mostly) on henges. Only the single-inhumation Round Barrows continued in use. The Long Barrow and Passage Graves were discontinued. After the fall of

the Absu it must have become obvious that the south sky was filled with stars, and there was no place for the mound or the island to where the dead were transported in the past. The southern sky was as empty as the northern sky.

The construction of Stonehenge was interrupted for 200 years after 2400 BC, a date which should probably be equated to 2349 BC. But there is no interruption of activity in Egypt or Mesopotamia -- not until 156 years later, after 2193 BC. [\[note 14\]](#)

For the date of "Noah's flood" political events in the Eastern Mediterranean region also do not seem to reflect a problem. It seems there was no apparent damage in Egypt or Sumer, despite the best efforts of chronographers to locate a "flood of Noah" at that time. What we know with certainty is that in 2193 BC, 156 years after the "flood of Noah," a worldwide catastrophe brought the civilizations of Egypt and Akkad to a halt and caused the eventual demise of the Harappan culture in the Indus valley by 1900 BC. The island of Malta was completely depopulated after circa 2200 BC. Malta may have fallen directly under the strike path of an arc from Venus in 2193 BC.

... the Conquests of Sargon

There is no evidence for a flood in 2349 BC in Mesopotamia. This is underscored by the conquest undertaken by Sargon of Akkad almost directly after the "flood event" of 2349 BC. His conquests produce the largest empire seen in the world to that time, comprising the subjugation of Elam in Persia, Sumer located south of Akkad, Southern Anatolia (Syria), and the coastal cities of the Northern Levant -- an empire extending from the Persian Gulf to the Mediterranean Sea.

Considering that the later event of 2193 BC caused the collapse of political systems worldwide, lasting 200 years, we could suggest that Sargon started his armies on the march almost directly after the "flood event" of 2349 BC. Had there been a worldwide flood or a similar catastrophe, would not Akkad, located directly north of Sumer, also have been affected? Instead, Sargon seems to have taken advantage of the jolt by Venus and the religious paralysis of Sumer. His patron Goddess was Ishtar, Venus.

We have no contemporaneous records of Sargon, only tales and legends recalled in Babylon a thousand years later. We do know, however, that he appointed his daughter and granddaughter as priestesses of the Moon god Nana of the Sumerian city of Ur. Hymns by one of the priestesses have been preserved.

... the Flood in China

The Chinese flood is mentioned in the first book of the *Annals of Shu*, the Chinese historical record dating to 2357 BC. It speaks of a flood which "stood above the mountains." This cannot be anything other than the Absu. What waters will stand up above the mountains? The

rains and storms, however, were real. (Incidentally, Psalm 104:6 reads, "the waters stood above the mountain.")

A person named Khwan, during the reign of Yao (Yâo), spent 9 years on the project of draining the waters from the valleys. His son Yu was hired and in turn spends 9 years on drainage. Yu is possibly a real person, and is the first king of the Xia dynasty which started about 150 years later, in 2205 BC.

The second book of the *Annals of Shu* recalls the work of Yu. Among the records on his assigned task of gathering an inventory of the resources of the land, is the following note:

"Being sent to the great plains at the foot of the mountains, notwithstanding the tempests of wind, thunder, and rain, he did not go astray."

Chinese history does not deal with the weather. It is unusual to find this anecdote.

Yao existed, it was estimated in circa 200 BC, from 2357 BC to 2255 BC, for some 100 years spanning what would be the date of Noah's flood in 2349 BC. Yao is Jupiter, and his initial date of first showing should be set at 2349 BC. Yao shared the throne with Shun during his last 30 years. His "death" in 2255 seems to be off by 100 years from better Bible, Mesopotamian, and Mesoamerican chronology. His reign should be around 200 years, not 100 years.

Shun clearly is the Moon, spending all of his time on monthly inspection trips, as described in the *Annals of Shu*, which even records that his inspection tours all start on the first day of the month.

The ending date for the reign of Shun, the Moon, is 2205 BC. This is 110 years after the Moon's birth, 144 years after the "flood of Noah." When Shun (the Moon) "dies" in 2205 BC, Yu, who had been employed by him in the administration of the land, becomes the first king of the Xia dynasty -- in time for the dry spell starting in 2193 BC. [\[note 15\]](#)

The much earlier flood of 3147 BC, which had come from the South Pole and the South Pacific, was not recalled by the Chinese, perhaps because of the width of the Pacific adjacent to China. Siberians remember a flood, but it came from the north, spread over the land, and then rolled back to the polar sea. Thus it may have been a rebounding wave.

For China it is the "flood" of 2349 BC which stood out, and although this "flood" was celestial in nature, it would have been accompanied by severe wet weather and heavy rains. Chinese history started with the aftermath of this "flood" when organized reclamation (needed because of the rains) was initiated by Khwan and later by Yu.

... the Temple Inscriptions at Palenque

The Maya temple inscriptions at Palenque in the Yucatan (circa AD 700) are one of only three Maya references to world history. The inscriptions place the birth of Venus, Mars, and Jupiter in 2360 BC. The Moon, "Lady Beastie," is their mother. The implication is that these planets became clearly visible when half of the ecliptic no longer dipped into the Absu to be obscured by the rings. Or so I would think. There is another, more elegant, solution also.

The date of 2360 BC (based on the Long Count) is earlier than the start of the "flood of Noah" in 2349 BC. It has been presumed that the dates of the carved texts for the birth dates of the three planets (November 8, October 21, and October 25) were selected to have a congruence of qualities so that they "matched" later dates used to argue the legitimacy of the ruler who erected the temples. They are not to be considered as dead accurate. However, the era (Baktun) and double-decade (Katun) were most likely completely correct. The dates were retrocalculated in AD 700 based on the Long Count and on a year of 365.24 days.

To correspond to a true solar year (which is the "calendar" used throughout these pages), rather than a Gregorian calendar year, the Long Count dates of Palenque should be moved forward in time by 22 years. Thus 2360 BC of the inscriptions, which precedes the flood of Noah, becomes 2337 BC which follows the flood of Noah by 13 years. [\[note 16\]](#)

Another hint that the events of 2360 BC have reference to the flood of Noah, is the transcription of the glyphs of one of the temples, the Temple of the Cross, which transliterates as:

*"753 years and 12 months after
[that is, after February 5, 3112 BC]
GI-prime [Saturn] had set the wac chan
[the World Tree house of the north,
mentioned in detail earlier]
and then the matawil person was born."*

*"On October 21, 2360 BC, the matawil,
the blood of Lady Beastie,
touched the earth."*

The first paragraph follows the detail of the displacement of Saturn from the north polar region to the ecliptic of the south. "The World Tree house of the north" is likely the northern polar plume after 3147 BC. The retrocalculated date of February 5, 3112 BC, for the appearance of Saturn in the ecliptic of the south sky, is about right. (It is a year and a half after the end of the era of the Gods, retrocalculated by Palenque as 3114 BC.) And then the "matawil person" was born.

Who or what is *the matawil*? Freidel and Schele have determined that Lady Beastie is the Moon, or the "First Mother" and this is generally accepted. They have *the matawil* as Venus. I'm not so sure. They translate the last line into readable English as:

*"On October 21, 2360 BC, GI [Venus]
the child of Lady Beastie, was born."*

It is a reasonable guess, considering that Freidel and Schele, like all archaeologists, have absolutely no clue as to what is really going on, and just assume the Maya were making up Gods to fill out a creation epic of sorts. Others have suggested that *the matawil* is a place. Some assume it is the dark space at the center of the Milky Way. Yet others hold that it might be closely associated with Palenque, in being a toponym for Palenque (the Spanish called the site *Palenque*, fortress).

I would think that *the matawil* might represent the doorway or gap in the "House of Bushes," as the *Chilam Balam* calls the Absu. Alternately I would suggest that it may represent all of the Absu. Then "the blood of Lady Beastie touched the earth" represents the fall of the Absu rather than meaning "the child of Lady Beastie" although "touched the earth" commonly is a phrase meaning "was born" in Chol.

Text at the doorways of the three temples reads as follows:

*"On October 21, 2360 BC,
GI [Venus], the matawil, touched the earth;"
"On November 8, 2360 BC,
GII [Mars], the matawil, touched the earth;"
"On October 25, 2360 BC,
GIII [Jupiter], the matawil, touched the earth."*

GI, GII, and GIII represent Venus, Mars, and Jupiter, following their dates of birth. This does not resolve what "the matawil" is. "The matawil" also follows the naming of Lady Beastie. In fact, we do not know if it should be presented as an ellipsis as in this translation, or if it should be understood as an adjective, a noun, or some other word form. If Lady Beastie is then the Moon, why was she born in the previous era, that is, before 3114 BC?

The Moon certainly would have been visible before 3114 BC, although only periodically, and seen at a considerable distance, often looking more like a star. But, considering that the temple inscriptions at Palenque also place the birth of Saturn, as a pure fiction, in 3122 BC and, like the birth of Lady Beastie, also before 3114 BC, it might be suggested that these two births and the implied marriage are just made up to suit the situation.

Also we cannot neglect that the Greeks, starting with Hesiod, held that the Moon preceded the births of all the other planets. We know that this isn't true. But what would have looked very much like the Moon at the earliest times would have been the lighted face of Jupiter, which was at a distance from Earth to make it look about the size of the later real Moon, or, as I have also pointed out, as an egg (and as recorded in pottery by Neolithic Mediterranean cultures since remotest times, as presented by Marija Gimbutas).

The Moon, as Lady Beastie, "lets blood" in 2325 BC (corrected to 2302.3 BC), a date separate from the 2360 BC event, when her "blood touched the Earth." Bloodletting is a trance ceremony of the Maya, used to commune with ancestors. Is this a plasma display of the Moon?

The Palenque inscriptions next claim that in 2305 BC (corrected to 2282.6 BC) the Moon crowns herself ruler. The inscriptions at Palenque were used to establish the legitimacy of the claim to rule by the Ahau of Palenque, who had attained his position through a matriarchal line. The inscriptions were meant to show that there was ancient precedent for this, for the celestial Gods also trace their ancestry through a woman ruler, the Moon. Frankly, I do not know how the concept of "rulership" might relate to the Moon in physical terms. The *Annals of Shu* claim 2287 BC as the year in which Shun (the Moon) joins Yao on the throne. At least it is an interesting near coincidence. [\[note 17\]](#)

The date of the Palenque inscriptions can be compared against the estimates listed in the *Annals of Shu*, as shown in the table below, where corrected dates for Palenque are shown against uncorrected dates from the Shu.

Palenque inscriptions			Annals of Shu	
event	inscribed	corrected	event	dated
Moon shows	2360 BC	2336.8 BC	birth of Shun	2318 BC
Moon bleeds	2325 BC	2302.3 BC		
Moon rules	2305 BC	2282.6 BC	Shun employed	2287 BC
			Yao dies	2257 BC
			Shun dies	2205 BC

... the *Chilam Balam*

There are also two mentions of the arrival of the Moon in the 16th century AD Maya *Books of the Chilam Balam of Chumayel*. The texts were transcribed from much older glyphic bark books. In Book 10 there is mention of the fall of the Absu, as the water which fell from the "center of the sky." Mention is made of the establishment of the intersection of the ecliptic and the last ring of the Absu, and that the Pleiades first showed above this intersection. Importantly, the arrival of the Moon is mentioned, although obliquely, in Book 10. I will elucidate the Chilam Balam in the chapters "The Chilam Balam" and "The Olmec Record of the Past."

The events of the *Chilam Balam* are listed by the names of Katuns, thus dating events to spans of 20 years. We have to supply the corresponding Baktun, that is, we have to guess the longer era of 400-Tun periods that a Katun falls in. All except one of the Katun dates of the *Chilam Balam* match the records from other sources -- or span the dates of these other sources outside of Mesoamerica. The dates need to be corrected in a different manner than the dates from Palenque. The text clearly recounts (among other celestial events) the 24th century BC, although listed wildly out of order. [\[note 18\]](#)

The Lifetime of Abraham

Abraham is variously dated anywhere from 2026 BC (534 years before the Exodus of 1492 BC) to 1271 BC (1876 years after the flood of 3147 BC). Traditional Bible chronology dates Abraham from 1812 BC to 1637 BC. In Appendix A, "Chronology Notes" I equate Abraham with Gilgamesh, but it would be more correct to equate Abraham with Jupiter. Some scholars have also equated Abraham with the Moon, or Moon-worship. Actually, I would suggest that the first orbiting of the Moon might have been used by the Bible editors to establish a 175-year life-span for Abraham. The first showing of the Moon might be 2325 BC. The demise of Jupiter is 2150 BC. This is 175 years, although here the date of 2325 BC is an estimate. However, by Egyptian reckoning, Abraham dates from shortly after 3147 BC, recorded as the first ruler, "Nemes."

Most Bible chronologists placed the birth of Abraham in 1900 or 1800 so that Abraham could have forefathers between himself and Noah, in fact, ten generations. As I mentioned earlier, all except the first and last of these 10 generations (in the Bible) were sired when their father was 29, 30, 32, or 35 years old. These are also my estimates of the intervals between appearances of Mars during the earlier period of 3147 to 2750 BC. The forebears of the Sumerian Gilgamesh (the kings of Kish in pairs) are spaced likewise. The Bible is a mix of events from different eras, which holds the "flood" of 2349 BC as the world flood, but derives all its other information from earlier eras.

It makes most sense to equate Abraham with Jupiter. The birth of Abraham then is in 2349 BC. His death is 199 years later, in 2150 BC. I have used these two dates as anchor points in developing the chronology of Jupiter.

The Assyriologists P.J. Wiseman, in *New Discoveries in Babylonia about Genesis* (1936), and D.J. Wiseman, in *Ancient Records and the Structure of Genesis* (1958), proposed that Genesis is a series of separate records, copied and collated by Moses, each ending in a colophonic phrase, like "these are the generations of Noah," called "Toledoth" in Hebrew. These recap what has been written up to that point (this happens 15 times) like a signature by the person who is supplying the record. At each of the 15 colophons, the writer is still alive, but nothing more is heard of him in the following text, except his age at death, which is related by the next writer. There is one notable exception: Abraham.

Who would doubt, however, that the most "prominent" individual in the Book of Genesis is Abraham? He, more than all the other great Patriarchs, would be entitled to be named in a Toledoth. ... "Yet", as Wiseman had observed, "it is remarkable that while lesser persons such as Ishmael and Esau are mentioned, there is no such Toledoth phrase as 'These are the generations of Abraham'"

-- from *California Institute for Ancient Studies*

That would present a problem for Bible chronologists, for Abraham needed parentage, being ten generations from Noah and the Noachian flood. The ten generations after the flood is correct, if the flood is understood as the worldwide flood of 3147 BC. The ten generations are the recalled ten appearances of Mars between 3067 BC and circa 2750 BC.

Bible chronologists, using a "flood" set at 2349 BC by Ussher, were thus forced to make Abraham first appear some 300 years later, variously in 1900 BC to 1800 BC. Ussher uses 1976 BC to 1801 BC, 175 years.

The Extinction of Jupiter

I estimate that Jupiter extinguished sometime in the era after the "flood of Noah," possibly in 2259 BC, as the *Annals of Shu* claims, although I am more comfortable with a date of 2150 BC, the end of the 199-year life span of Abraham (as Jupiter) since 2349 BC. The large coma of Jupiter would, at any rate, have come to an end as the planet slowed its retreat from the Sun on reaching its final orbital destination and, once at that destination, its electric potential started to match the electric field of the Sun at that remote distance. At first the glow mode discharge would have simply diminished as the flow of plasma decreased. Then Jupiter would have experienced a sudden change from glow mode to dark mode plasma discharge, as plasma flows do when switching between modes.

There is a planet fire recorded in the *Chilam Balam*. The text of Book 10 reads, as a concluding line to a description of Jupiter:

"Suddenly on high fire flamed up. The face of the sun was snatched away, taken from earth."

"This was his garment in his reign. This was the reason for mourning his power, at that time there was too much vigor."

The "face of the sun" is Jupiter, the Midnight Sun -- "Lord Sun" of the Maya. The "excess vigor" might be translated as "commotion" as if to suggest that the effects were experienced on Earth. They were not, except for the religious changes -- the sense that their god had been removed from near Earth to a far off distance, as it diminished to the size of a star.

The *Chilam Balam* seems to date the extinction of Jupiter to a Katun 8-Ahau (as seems most likely), placing this event in 2167 to 2147 BC, which matches the extra-Biblical date 2150 BC which I am using from other sources.

Of the other sources, the first is the portion of the *Annals of Shu* compiled during the Xia dynasty. The Xia dynasty has other records of events noted to be contemporary with the events, that is, not "mythological" (the "mythological" records read, "Looking into antiquity, we find...").

Under the Xia we are getting descriptions from sensible Chinese humans, who could care less of stars and planets, writing, however, that there was "a celestial phenomenon" in about 2153 BC. This is recorded in Book IV, "The Punitive Expedition of Yin," of Part III, "The Books of the Hsia [Xia]." James Legge records that, *"This Book is another of the 'Speeches' of the Shu, belonging to the reign of Kung Khang, a brother of Thai Khang, the fourth of the kings of Shang (B.C. 2159-2147)."*

The second source is a cuneiform tablet of Gudea (as discussed earlier), governor of the Sumerian city of Lagash in 2144 BC to 2124 BC, concerning a brightening -- the "overwhelming splendor" of Ningirsu, who "changes darkness into light" -- dated to the mid-2100's.

Ningirsu is Jupiter (although the name is also assigned to Saturn). Gudea was dedicated to Ningirsu, building him a temple and supplying weapons of war for the temple (Ningirsu is understood as a war-god, which is not characteristic of Saturn or of Jupiter). The building and dedication activities are probably an indication that Jupiter had disappeared altogether from the skies, and that Lagash was in trouble. The social reforms, return to traditions, and fervor of religiosity initiated by Gudea must reflect attempts to keep Lagash alive under the adverse condition of a disappeared God. This was also 50 years after the start of the agricultural failures of 2193 BC.

Having established that something spectacular happened around 2150 BC, the question next becomes, What happened?

Most likely Jupiter experienced a sudden change from glow mode to dark mode plasma discharge, which is how plasma flows behave. Since this involves a marked decrease in current flow, the driving voltage would have risen suddenly and could have resulted in a brief return to a much higher current rate -- a brief change to arc mode. After the sudden change to arc mode, Jupiter would again have dropped to dark mode, and been reduced to the size of a star.

This is regularly seen elsewhere in the Universe where stars repeatedly explode into brilliance and subside as they switch from arc mode to glow mode or dark mode (a loss of the coma). After the extinction, Jupiter would have all but disappeared from view, for in the final dark mode nothing would be seen of a coma.

The Midnight Sun had stood in the sky for nearly 1000 years, and with a huge coma for much of that time, and certainly the last 200 years. And for all that time there were no interactions with the Earth, except to disappear after some months and return again.

Then in 2150 BC it suddenly brightened and died, while in view of Earth. The Midnight Sun would have suddenly shrunk from a Moon-sized brilliant globe set on a mountain which lit up the night skies to just a bright star (still the brightest planet in the sky today, next to Venus). Since in the text above I have suggested that the burning of Jupiter could have been a

switch from a failing glow mode plasma briefly to arc mode, there is certainly a good possibility that it did indeed involve a planetary fire. A single location of an impinging plasma in arc mode could have set off the ignition of an absolutely massive fire as methane and hydrogen burned, engulfing the largest planet in the Solar System. It would have been spectacular. There are problems, of course, with the temperatures near absolute zero. But the striking of an electric arc raises the temperature locally by thousands of degrees.

The fact that the coma of Jupiter was red since leaving the asteroid belt could be indicative of low-level oxygen in an excited state, but it could also be hydrogen or methane. This would be an explosive combination, although not normally at utterly low temperatures. That might explain why this had not happened earlier. Perhaps the statement in the *Chilam Balam*, that "suddenly on high fire flamed up," should be taken at face value. This was not a coma in arc mode, it was flames. The same, of course, was said for the Tower of Babel.

The Career of Jupiter

The story of the flood of Noah is the story of the death and resurrection of the primary God of antiquity. It is a story which will be repeated and re-represented for the next 4,500 years -- to today. Let me present, then, the career of Jupiter in narrative form, and follow it with some background information.

At this point we can describe the complete career of Jupiter from before 3147 BC to its last flaming and extinction in about 2150 BC. The complete career of Jupiter, from the first time he was noticed in the skies is as follows:

- Before the end of the "Era of the Gods," 3147 BC, Jupiter was certainly seen, alternately as a moon-sized egg shape when Earth and Saturn were inside the orbit of Jupiter, and as an up-turned crescent shape when Earth and Saturn were outside Jupiter's orbit. The distortions in both instances were due to the fact that Earth was some three million miles (4.8 million km) below Saturn, and thus Jupiter was seen from a much lower perspective (Saturn's orbit additionally dipped 1.3 million miles, 2 million km, below Jupiter's orbit at times.)
- The egg-shape shows up in pottery decorations during this period (the European Neolithic); the crescents less so. As I have pointed out previously, a painted pot of the Classical Maya era, depicted in *Maya Cosmos* by Freidel and Schele, presents the imagery of six Gods in council with a seventh and elder God. They are advising the seventh god to start creation.
- The seventh and elder God (God L) is easily identified as Jupiter as well as the Maya "First Father." The six Gods have various names, of which some are easily identified. God "Three Born Together" is obviously the three plasmoids of the south and God "Nine Footsteps" is Mars. Subtracting God "Three Born Together" of the south leaves the five Gods all associated with the polar configuration of the north as described in the *Popol Vuh*.

- The image on the pot illustrates, in somewhat different form, the conferences between the three gods of the south and the five gods of the north which are related extensively in the *Popol Vuh*. What is different here is that a seventh god is invoked, the old God L, who is without a doubt Jupiter, as can be derived from Classical Era iconography. What is amazing about this also is that the Maya, from their own sources, or from books derived from the Olmecs, would recall the primacy of Jupiter, dating back to the time before 10,900 BC.
- In the sculptures at Palenque (AD 700) Jupiter is also identified as one of the old-man gods holding up the "bleeding dragon" bar in the Temple of the Sun (a sculptured panel also called "the War Stack"). The Maya of Palenque were certainly aware of Jupiter as well as Saturn -- as specks in the sky -- as shown by the inscribed text (at Palenque) of a close conjunction on July 23, AD 690, of Jupiter, Saturn, Mars, and the Moon.
- In 3147 BC, Saturn and its companion planets passed by Jupiter, so that Jupiter was between Saturn and the Sun. Jupiter, on a smaller and faster orbit, caught up with Saturn and its companion planets. Once the plasmaspheres touched, electric interactions caused a massive electric shock, followed by electric arcing. The small planets Earth and Venus, were not involved in the interactions, probably because the reformed combined plasmasphere of the giant planets locked them out. [\[note 19\]](#)
- Certainly this involved the flow of plasma as gigantic interplanetary lightning bolts spanning millions of miles, but the most violent interaction would have been the electric attraction initiated as soon as the planets could first sense each other's electric fields. I am suggesting "attraction" here because Saturn and its companion planets would most likely still have been at a charge level (voltage) representing the far region of space outside of the Sun's plasmasphere. Only a condition of attractive forces could account for the relocation of all the large planets to the far reaches of the Solar System.
- The pulse would not have lasted long, for after receiving an impulse which disturbed the orbits of the four large planets, the planets separated and individual plasmaspheres would have formed again, in effect isolating them from each other. Jupiter must have been diverted from its normal orbit path, attracted to the Saturnian set on an outer orbit.
- The change in forward speed would normally have cast Jupiter completely out of the solar system. But since Jupiter at some point does reach a stable orbital location, it has to be suggested that Jupiter's forward speed was modified by the planet's passage through the asteroid belt.
- Saturn, Neptune, and Uranus would have been yanked backwards from their normal orbital path. The initial attractive force must have been almost at right angles to their orbits, resulting in a greatly reduced forward (orbital) speed. The orbits which the Saturnian planets eventually settled into is related to their mass and to their distance from Jupiter at the first moments of electric contact. Their orbital speeds also were modified by passage through the asteroid belt.
- Jupiter, now under electric stresses because it was moving away from its former location near the Sun, produced a coma and a gigantic tail. Unlike comets, Jupiter's giant plasma flow appeared at the south geographic pole (the location of the north magnetic pole), with lesser plumes at the north pole. Jupiter's magnetic field is reversed from that of any

of the other planets and is also ten times stronger than any other planet.

- The lower plasma tail became the mountain to which the people of Earth see Noah's ark moored. As we know from Egyptian sources and the Mesoamerican *Popol Vuh*, the mountain of Jupiter was colored green initially.
- The first view of Jupiter after the flood is recorded in Sumerian flood stories, in the Bible, and in hundreds of other "flood" myths. The vertical separation of the planets can easily be found from current orbital data. The initial vertical locations are discussed in Appendix B, "The Celestial Mechanics."

The view of Jupiter seen from Earth initially was of a bright crescent on the bottom of the globe. This was the view seen from far below Jupiter, seen about 45 degrees up from Earth. Only a crescent was seen, even though all of Jupiter's face was lighted by the Sun.

Humans at this time had no concept of the extended space away from the Earth. The concept of Earth and all the surrounding space was that of a land mass enclosed by an "ocean" in the south (the equatorial rings), and another region in the north where the river from paradise (the "real Earth") had been seen to flow toward the land of Middle Earth. It was like living at the bottom of a bowl.

A widening (green) plasma discharge in glow mode extended down from the crescent (from the south pole of Jupiter). From the perspective of Earth the crescent looked like the ship of Noah placed on the mountain where he had landed. Both the "ship" and the "mountain" which were seen at the end of the flood are ubiquitous elements of the 500 or more flood legends throughout the world.

The huge horned shape which had been seen approaching (or seen earlier and known about) was also identified in Egypt as the celestial bull who wrecked the city of the Gods -- he is shown as such on the Palette of Narmer, and one other palette from the same predynastic period, but, significantly, not on earlier cosmetic palettes. Jupiter also appears as the "bull of heaven" in the Mesopotamian *Epic of Gilgamesh*.

- As the Earth traveled further along its new orbit, the view of the battling planets (Jupiter, Saturn, Neptune, and Uranus) changed from an initial view from below to a side view of the same planets in the southern skies. Immediately after being released from the electric field of Saturn, the Earth would have changed its orbit so as to have the Sun again as one focus. The new orbital inclination to the equatorial of the Sun would be at a steep angle -- 7 degrees to the equator of the Sun. Within a half year the Earth would pass to above the equator of the Sun, and the people of Earth would get a new point of view on the receding giant planets, now seen in the south sky at night. The rings of Saturn were now seen edge-on as Earth's orbit lifted past the equatorial of the Sun.
- The Maya *Chilam Balam* reads that Saturn was thrown on his back by Jupiter. This was the new view which saw the rings of Saturn edge-on. The first "pyramid texts" of Egypt state the same thing: that Osiris (Saturn) fell on his side and died -- at the riverbank. The riverbank is understood by later Egyptians as the bank of the Nile, but obviously the

riverbank originally was the edge of the ecliptic.

- Both the Bible and the Sumerian flood legend record birds being released to test the abatement of the floodwaters. In the Sumerian version, the first two birds return. These were the bright Venus (the dove), and what would seem to be Mercury (identified in Sumer as a swallow) but more likely is the Moon (when it still had an atmosphere). Because Venus returned (being on an inner orbit), it was assumed that the Earth had not dried up yet. The third bird to be released is Uranus, as a dark raven. On an outer orbit, Uranus did not return.
- The Sumerian interpretation is different from the Bible story, where the raven is released first, but only the later return of the dove with an olive branch signifies that the Earth had dried up. (The earlier release of the raven in the Bible is much more correct to the celestial mechanics.) To Utnapishtim (the "Sumerian Noah"), it is actually the travels back and forth of the raven (Uranus) that signals that the waters had ebbed. Noah is not convinced until the dove (Venus) returns with an olive branch -- the green tail it had developed in taking its first turn around the Sun.
- Note that, in both flood stories, it is only a matter of weeks before the Earth has dried up and Noah and Utnapishtim would exit their arks (fourteen days in the Sumerian version, forty days in the Bible.) The flood from the south polar seas of the Earth was a singular event, sweeping across the land like a tsunami, and rolling back at once, but then sending secondary waves north.

The duration of the flood, as presented in the legends, is in agreement with the fact that Jupiter would soon be seen from a much greater distance (half way across the orbit of Earth, rather than only a few million miles), frontally lighted by the Sun, but now looking much smaller. To both Noah and Utnapishtim this sight is a fire lighted for a sacrifice to the Gods. Seen from upward to one AU (93,000,000 miles, 150,000,000 km) away from the scene of the "collision," the planet Jupiter with its coma would have looked about the size of today's Moon, with the actual globe within the coma lighted by the Sun, and all of this still standing on its mountain, with wisps of plasma extending above the upper part of the coma -- seen as smoke of a sacrificial fire lit by Noah or Utnapishtim. The satellites of Jupiter orbited the fire.

*"I made an offering on the peak of the mountain:
The gods smelled a savor,
The gods smelled a sweet savor,
The gods gathered like flies over the sacrificer."*

-- Theophilus Pinches, translator, *The Religion of Babylonia and Assyria* (1890)

- Over the next few years Jupiter and Saturn, traveling at different orbital speeds, would be seen to pass each other as both planets receded from the Sun. It is unlikely that Saturn developed a plasma tail. Later Egyptian legends speak of the casket of Osiris (here Saturn) drifting out to sea (the Duat again). An image of a casket is possible if Saturn had a plasma tail, but I seriously doubt if this was ever so. The casket thus more

likely is Jupiter.

Osiris in his casket drifted out to sea, and north to Biblos (which was an Egyptian port of trade in Lebanon), and became lodged in a tree -- the north polar plasma column -- after which not much more of Saturn is seen at all in the sky, having by this time perhaps distanced itself considerably. There are, of course, later tales of Isis removing Osiris from the trunk of this tree.

- The engagement of Jupiter and Saturn could certainly not have lasted all that long, as they would soon become separated by their new spiraling orbits. We do know from some early depictions and late literary sources that there were frequent plasmoid thunderbolts between Jupiter and Saturn and the other Titans (and even originating from Venus), launched like missiles which landed with explosive effects. This may have lasted 80 years, although it is uncertain how much of this time period (assigned by the Egyptians) was occupied with "battle" and how much with "negotiations."
- The "negotiations" were the constant ranging of planets around the ecliptic followed by regrouping every few years near the slowest planets, Jupiter and Saturn, something never seen before by humans. To the Egyptians, the planets, as Gods, were having meetings. For the Egyptians it was most important to again have a celestial king assigned as ruler of the lands, and thus they describe the "negotiations" in detail. The claims between Seth and Horus are described in details encompassing the plasma interactions of the planets and possibly the asteroid belt, but all of it described by the Egyptians as taking place in a swamp, the Duat. [\[note 20\]](#)

The remaining career of Jupiter can be followed with some confidence. This is not true of Saturn. Saturn must have been unremarkable looking, except when its rings were still seen, and now known to go also behind the planet. Saturn just seems to disappear from active mythology, although the planet was watched and tracked throughout all of antiquity, everywhere. Saturn soon would have been a tiny speck of light among the stars (and moving very slowly). [\[note 21\]](#)

The Asteroid Belt

Jupiter took on the role of Osiris after Saturn disappeared from view. He is understood as mummified, standing up in the sky, with his mantle reaching down to the horizon. The toroidal equatorial plasma form produced what looked like two eyes staring back to Earth. Jupiter would have looked gigantic until it reached the first objects of the asteroid belt at about 2 AU. That would have taken perhaps 300 years after 3147 BC. A period of 288 years is a calculation based on a linear regression of Jupiter from the Sun (see the chart further below).

[Image: "Histogram of the semi-major axis of asteroid objects; and path of Jupiter between 3147 BC and 2150 BC. The left ordinate represents both the number of asteroids and also the date, as BC, in the previous era." (Data: <ftp.lowell.edu/pub/elgb/astorb.html>. Plotted at case.edu/sjr16/; Information for 336,341 asteroids. Additional graphics for Jupiter added.)]

- On reaching the asteroid belt the coma did not need to be particularly large and its lower mountain form would have shrunk to a plasma pouring sideways from the bottom of the globe, since electric contact could be made to the 300,000 or more asteroids (some suggest millions) which occupy the belt between 2 and 3.5 AU, plus all the dust already in place because of the passage of three other giant planets.
- Jupiter may have dimmed and then brightened again in passing through the leading clump of asteroids. By chance, my calculated date of the disappearance of Jupiter into the asteroid belt (2860 BC) is nearly the same (2890 BC) as the date of the end of the first dynasty of Egypt. Egyptologists cannot find a cause for the change between Dynasty I and Dynasty II. If my suggested dates are even reasonably accurate, then I could suggest that the change in dynasties was due to a religious crisis of immeasurable proportions: the mummy of Osiris had disappeared.

Jupiter eventually was displaced to 5.2 AU from the Sun. If Jupiter had started its recession at 0.7 AU (as I will suggest later), it would have moved at a rate of 221.5 years per AU. This is plotted on the chart below.

The career of Jupiter

Note: the locations and dates are approximate, based on
 $\text{date} = 3147 - (\text{location} - 0.7 \text{ AU}) * \text{rate of recession}$
 Note: dates revised about 15 percent 2/2011

event, location	event date	concurrent look	period of time
-----	-----	-----	-----
starting location from 0.7 AU	3147 BC	mountain form	~288 yrs
start of asteroid belt, ~2.0 AU	2859 BC	shen form	~332
end of main asteroid belt, ~3.5 AU	2527 BC	mountain form	~89
last set of asteroids at ~3.9 - 4 AU	ca 2438 BC	return of shen	~89
fall of the Absu at 4.3 AU **	2349 BC	mountain form	
another interruption ?			
	ca 2337 BC	extinguished? Moon shows?	
	ca 2283 BC	Moon in orbit, mountain form?	
at 5.2 AU location	ca 2150 BC	end of travel, extinguished	
The linear rate of recession is based on			
(3147 - 2150)/(5.2 AU - 0.7 AU) = 221.5 years per AU.			
** location calculated			

In the above chart the date of 2349 BC was set, and the location for this was calculated. The return of the mountain form in 2349 BC was due to the giant plasmoid from Venus. There may be a progressive error in this chart as Jupiter recedes further from the Sun because I have used a constant rate of radial recession. This may not be justified.

The date of 2150 BC, when Jupiter reached 5.2 AU in this linear model, is fairly well supported from a number of sources. The distribution of the semi-major axis of the asteroid objects shown in the graph above represents today's conditions. There is no reason to believe that most of the asteroids were not in approximately the same location from the Sun 5000 years ago as they are today.

The exception certainly are the two sets of asteroids (the Trojans and the Greeks) which are today located at 5.2 AU, in the orbit of Jupiter, and displaced about 60 degrees from the planet. These are thought to have been distributed to these Lagrangian points (gravitational minimums) of Jupiter's orbit through gravitational interactions with Jupiter over the last 4 billion years. Nothing explains why these asteroids are still there and are as widely distributed about these locations, except that they have only recently arrived at these locations.

Their location far removed from the main mass of the other asteroids is also peculiar. It certainly suggests that these are remnants of asteroids from the asteroid belt which were gravitationally removed by the movement of Jupiter through the Asteroid belt. That might also explain the paucity of asteroids near the end of the Asteroid Belt at about 3.9 to 4 AU, for on the basis of "historical" evidence, there should have been considerably more asteroids at the location of 3.9 to 4 AU, since Jupiter seemed to have again lost its coma and tail at this location, corresponding to a time 100 years before the "flood" of Noah in 2349 BC.

Surprisingly, some "Trojan" asteroids have been found for the transjovian planets, suggesting that these also were removed from the asteroid belt with the movement of these planets

through the belt. These Trojans are far fewer than the 1500 or more which follow Jupiter. But then, Jupiter has more mass than Saturn, Neptune, and Uranus combined. Six Trojans have also been found to follow Mars, and Trojans are suspected for Earth. (The first Trojan to be associated with Earth was announced in 2011.)

- The peculiar gaps in the Asteroid belt are due entirely to the action of gravitational forces of Jupiter over the span of 5000 years, but the same gaps would also result if Jupiter had been on an inner orbit since the breakup of most of the asteroids about 3.2 million years ago. This is discussed in more detail in Appendix B, "The Celestial Mechanics."
- The asteroids represent an estimated total mass of 1×10^{22} kg. This is very little -- about 12 percent of the mass of the Moon. The majority of asteroids are of the chondrite variety, that is, they are rocky, and have a break-up date of 3.2 million years ago. The rocky composition suggests a smaller planet rather than a planet large enough to have had a metallic core. But this also suggests that, at the time Saturn and Jupiter passed through the asteroid belt, there might have been much more material than what remains today.
- Additionally, every plasma contact with the asteroids would have generated additional positively charged fine dust to be electrically repelled and launched into the space between the asteroids. The fireworks must have been spectacular. It should be apparent that the fine dust would have supported a continuous plasma flow from Jupiter.
- The asteroids represent planets which were part of the original Solar System. As the remnants of exploded Moon-sized planets there might have been fewer asteroids in number and the fragments might have been larger. Much of the debris could have dated back millions of years, as can be ascertained from the break-up ages of meteorites ("meteorites" are asteroids which have fallen to Earth) -- 3.2 million years for the Chondrite meteorites, 100 and 700 million years for the iron meteorites. The various meteorites have a creation date (as opposed to their "breakup" age) of 4.4 and 4.6 billion years ago. As planets these may have orbited the Sun since the remotest times.
- Jupiter was not likely the cause of the breakup, first of all because (as developed here) the asteroids were in their location long before Jupiter passed through them after 3147 BC, and secondly because the pre-asteroid planets would have been at a charge level appropriate for their location from the Sun if they had been orbiting the Sun since their creation 4.4 to 4.6 billion years ago. Saturn, however, when repeatedly entering the Solar System at the potential (charge level) of deep space, would have been quite capable of electrically causing the breakups.
- But because Saturn would initially have traveled on a steep trajectory (I am assuming), the 20 entries into the Solar System would have done considerably less damage than the movement of the four planets away from the Sun after 3147 BC, which were on spiral paths -- resulting in much greater contact with the asteroid belt at that time. As noted above, the most recent breakup age for asteroids is 3.2 mya. This corresponds to what I have assumed to be the last entry of Saturn into the Solar System.
- Although it is here suggested that the breakup ages of many meteorites should be on the

order of 5000 years, it should be understood that the mainstream Establishment researchers would delete any such data as measurement errors. Recent breakup ages would not likely be admitted.

- Initially, on reaching the asteroid belt, Jupiter would have discharged via plasmoid thunderbolts. This is the second battle of Zeus described by Hesiod, where various monsters are attacked. The plasmoids are visually described in the name tags of the predynastic king Narmer of Egypt (circa 3050 BC). "Narmer" translates as "catfish-drill." Plasmoids have all the looks of catfish, and a drill is a stone-working tool which stirs up clouds of dust in its application.
- The asteroid belt initially consisted mostly of rock fragments with some dust intermingled. Only after considerable additional dust had been created by the first massive plasmoids lightning bolts of Jupiter, would this activity subside to a more continuous stream of plasma. In the meantime, the dust and the asteroid objects must have taken on monstrous shapes. The dust remained for some 4900 years, lit by the Sun, and defined the ecliptic as the road of the Gods until very recent times.
- Jupiter would have entered the asteroid belt at an estimated date of 2860 BC. Once inside the asteroid belt, the electric discharges moved "sideways" from Jupiter -- from the north magnetic pole at the bottom of the planet, to the nearby asteroids and the clouds of particulate matter created in earlier discharges (and from the other planets which passed through). The plasma in glow mode would follow the magnetic field lines and be directed to the dust of the asteroid belt from the south geographic pole. (This would have primarily been an inflow of electrons directed to Jupiter, but also an outflow of protons and other disassociated ions.)
- Seen from Earth, Jupiter thus would have looked like a red disk seated on a plane below its coma while within the asteroid belt. A symbol for this, first dated from the third dynasty (after circa 2850 BC), is the "shen," a circle placed on a line, often made to look like a rope, that is, with a set of knots at the bottom. The same symbol is used from the end of the same third dynasty as the "cartouche" used to write the names of pharaohs.

[Left Image: Shamash holding a shen; Mesopotamian seal. After Wikipedia; Right Image: Egyptian carved shen symbol. After globalegyptianmuseum.org.]

- Images similar to the "shen" are found in Babylonia (above). Some Egyptian variations of the "shen" have "hairs" at the top and bottom of the circle. This completes the look of a plasma discharge from the magnetic poles, with the north geographic pole supporting a much lesser amount.
- The Egyptian crown of Re (Jupiter) and Amun-Ra (Jupiter as "the hidden sun"), is depicted as a red globe above nearly horizontal twisted ram's horns. A frequent depiction of the "shen" is with the circle filled in solid red, which would represent the mostly spherical coma of the planet. The *Chilam Balam* states that Bolon-ti-ku (Jupiter) was red when he "sat" in rulership.

"Red was the mat on which Bolon-ti-ku [Jupiter] sat. His buttock is sharply rounded, as he sits on his mat."

- Notice that Jupiter has changed color after exiting from the asteroid belt. He was green originally (or the tail was) when he moved into the south skies after 3147 BC, which is how the mummified body of Osiris is always depicted. But on entering the asteroid belt and later, Jupiter lost its green mantle and the coma turned red.

Special thanks to J Brookes for suggestions on the cratered back of the Moon.

Endnotes

Note 1 --

Since there is no record from antiquity for rings of Jupiter or the Titans, it is likely that the current rings of these planets were acquired from dust in the asteroid belt. This might also explain why Mercury has no rings, since I do not think Mercury ever entered very far into the asteroid belt. The original orbit extended to the edge.

Thornhill suspects that the minor magnetic field of Mercury is induced in its travels between perihelion and aphelion, which increases its orbital radius by half in each 88-day circuit around the Sun. This would move it alternately into two considerably different regions of the electric field of the Sun.

[\[return to text\]](#)

Note 2 --

There was a doorway, caused by the Earth's shadow on the rings.

To have the rings come close together at the east and west cardinal direction would depend on having an unobstructed view of the horizon at sea level. Of course the rings were seen to

move differentially with respect to each other. This would certainly take away from the image of the house of a God as a stable object.

[\[return to text\]](#)

Note 3 --

That the number of rings should increase with high latitudes is a discrepancy I cannot explain. Nine rings are also noted for some Northern European locations, and possibly in India (where the latitude of the observations is not at all clear).

[\[return to text\]](#)

Note 4 --

In summer, at the solstice, with the Earth tilted at 23.5 degrees toward the Sun, the shadow will be found to extend 6000 miles (9600 km) onto the disk of the rings from the equator, $4000/\sin(23.5) - 4000 = 6031$ mi, using 4000 miles as the radius of the Earth, and be shaped as a semicircle. In winter the shadow is actually cast on the bottom of the rings, but visually the results would be the same.

[Image: Earth's shadow on the equatorial rings at summer solstice. Illustration by J. Cook.]

This is the minimum dimension for the portal. As the spring or fall equinox approached the shadow would lengthen to become infinite. If the rings extended less than 6000 miles (9600 km) from the surface of the Earth at the equator, there would always be a gap (rather than an oval shadow). However, I have shown in an earlier chapter that I would expect the rings to extend about 8500 miles (13,600 km) above the Earth's equator.

In a later chapter I develop the idea that the Earth's axial inclination (to the normal of the

orbital plane) was 30 degrees before 685 BC. I should note the results here. With an axial inclination of 30 degrees, the shadow will be found to extend only 4000 miles (6,400 km) onto the disk of the equatorial rings, $4000/\sin(30) - 4000 = 4000$ mi in mid-summer and mid-winter. Again, the shadow would extend infinitely at the time of the equinoxes.

[\[return to text\]](#)

Note 5 --

The beam of the ecliptic would connect the left and right edges of the Absu or Duat only at the time of year near the equinoxes. The ecliptic would dip into the rings at the autumnal equinox and rise out of the rings at the vernal equinox. The portion of the ecliptic behind the shadowed rings would be obscured, except for bright planets. In summer (at night) the ecliptic would disappear behind the Absu, and in winter be placed above the Absu -- as with the Moon and planets today, which travel high in the winter night sky and low in the summer. The post and beam "gates" in China are said to be imported with Buddhism after AD 200.

Note 6 --

The construction of a ballcourt -- a flat plane between stepped pyramids or inclined embankments -- is derived in Mesoamerica from descriptions recorded in ancient glyphic books, not from directly remembered experiences. It is a view of the trapezoidal gap in the Absu at the time of the equinoxes, which disregards the fact that the left and right embankments were probably not visible at the same time. The central playing field of the horizontal space between the embankments is accurately rendered, but notice that the ballcourts vary tremendously in size, as does the slope of the walls, although somewhat less. This suggests that the ballcourts are not modeled on a physical object which could be used as a model for the builders.

Teotihuacan, one of the three largest cities in the world in about AD 700, did not have a ballcourt. But the orientation of the main street and the Pyramid of the Sun with the horizon in effect turned the whole city into a giant ballcourt, using the Sun as the ball. More on this in a later chapter.

[\[return to text\]](#)

Note 7 --

The name "Ra" or "Re" was probably transferred to Jupiter without hesitation by some of the Egyptians temple domains after 3147 BC, for the apparition of the globe of Jupiter in the south sky was nearly identical in size and in other aspects to the earlier view of Saturn at the north horizon. Only the fact that Jupiter soon (after about 200 years) reached the edge of the asteroid belt and lost much of its coma and all of its tail, at a time when Horus had been appearing regularly in the skies above Earth, kept Jupiter from being accepted universally as chief of the Gods at that time.

[\[return to text\]](#)

Note 8 --

The Himalayas today are held to be very young, having "reached" their current height after the ice age, and often suggested to have done so in historical times. The mechanics are discussed in Appendix B, "The Celestial Mechanics".

[\[return to text\]](#)

Note 9 --

In the second century AD Ptolemy reports the star Sirius as red, as do others in late antiquity. However, Sirius is listed as white by the Arab (Persian) astronomer Al-Sufi in the *Book of fixed Stars*, published in AD 964. Both Ptolemy and Al-Sufi were very competent astronomers. Details of how Sirius disappeared behind the last red band are presented in the Appendix "The Red Sirius."

[\[return to text\]](#)

Note 10 --

The outer red ring may have lasted a long time after the fall of the Absu, and along with the bright ecliptic become known as one of the roads or rivers of the sky. In the *Popol Vuh*, Hunahpu and Xbalanque reach the domain of the underworld by crossing the river of blood (the last equatorial ring) and the river of pus (the ecliptic).

The Classic Era Maya (AD 400 to AD 700) graphic of the Wakah-Chan Tree consists of an upright tree (identified by others as the Milky Way) with a cross bar and with a serpent (called the "square-nosed dragon") draped over a cross bar. I would identify the draped serpent as the ecliptic and the cross bar as the equatorial, although this identification may be reversed. The cross bar (at times the ecliptic serpent) has heads at both ends of its body, one identified as the Sun, the other as Venus. I think the double-headed bar likely represents the plasmoid lightning bolt directed at the Sun by Jupiter in 685 BC, and seen worldwide, which will be discussed in the chapter "The Tablets of Ammizaduga."

Note 11 --

If the Moon changed its orbit, the force that altered its course might show as the Orientale basin compression scar located at the extreme lower left edge of the Moon as seen from Earth. The Orientale Basin is overlaid with younger craters, and is thought itself to be one of the "youngest" craters or basins. It is (of course) held to be 3.9 billion years old. The outer ring of displaced mountains is 200 miles (320 km) in diameter.

The Moon retained its original path around the Sun, which has an inclination to the Sun's

equatorial which is slightly different from that of the Earth.

[Image: Orientale basin of the Moon. After NASA.]

[\[return to text\]](#)

Note 12 --

John Anthony West in *Serpent in the Sky* (1979) claimed that the excess erosion of the Sphinx is due to rainfalls thousands of years before the construction dates of the Pyramids (2600 to 2500 BC). He wrote, "*The last time Egypt experienced a rainy period capable of producing such weathering effects was the Neolithic Subpluvial, between 5000 and 7000 BC.*"

However, Colin Reader, in "Giza Before the Fourth Dynasty" *JACF* (2002), writes that wetter conditions existed in general in Egypt "as late as the end of the 5th Dynasty" (circa 2500 BC). The Giza pyramids were built during the 5th dynasty. He also suggests that most of the weathering of the Sphinx took place before the building of the pyramids, but he dates the Sphinx to the first or second dynasty. The first dynasty ended in 2850 BC. He also suggests that additional weathering is due to seepage from the adjacent areas of the plateau where limestone was removed during construction of the pyramids and the quarries backfilled with rubble.

Let me add to the rains proposed here the following two: first, the incessant rains during the fall of the Absu at the end of the 5th dynasty (2349 BC), and second, the initial rains of the years of darkness after the Exodus (1492 BC).

[\[return to text\]](#)

Note 13 --

In this instance, 2349 BC, the interplanetary lightning strikes consisted of a series of 9 plasmoids following an initial much larger plasmoid. Some of these may have landed in

Central Asia on the second day.

[\[return to text\]](#)

Note 14 --

See the website of Timo Niroma for a detailed overview of the 2349 BC and 2193 BC events, at [\[personal.eunet.fi/pp/tilmari\]](http://personal.eunet.fi/pp/tilmari)

[\[return to text\]](#)

Note 15 --

It would seem to be difficult to disassociate the first showing of the Moon from the events of 2349 BC, with the exception of the life span given to the Moon in the *Annals of Shu*, which is only 110 years.

The "death" of Shun, the Moon, when "he went on high," is likely to be a change in the orbital path of the Moon, coinciding with an increase in the Earth's orbit in 2193 BC. Thus the 110 years since the "birth of Shun" should probably be lengthened to 156 years, if we assume that the Moon showed up at the earlier increase of the Earth's orbit.

[\[return to text\]](#)

Note 16 --

The date correction is based on the assumption that the backward extension of the Long Count by the Olmecs in 747 BC was based on a 360-day year. This is clear from the 20-day Uinal "months" which add up to a Tun ("year"). There are 18 of these months to make up a Tun. All other measures rotate at a value of 20 -- Kins, Tuns, and Katuns. (Baktuns rotate at 13.)

This was done by adding 6 Baktuns to the count of 0.0.0.0. The history of past events was probably a listing of Katuns and Baktuns (where a Baktun is a double-decade of Tun years). But when the Maya retrocalculated in AD 700 they would have used a 365.24-day year to arrive at a predetermined Baktun and Katun. Our calculation based on the Long Count is also based on the assumption of Gregorian years (365.24 days) in the remote past, and thus also places events too far into the past by 5.24 days per year. Thus to recalculate the inscribed Long Count dates to the correct chronography, a value of $(\{\text{date}\} - 747) * 5.24/365.24$ years needs to be subtracted from the Mesoamerican dates. See the chapter "The Maya Calendar."

A date from the Palenque sculpture which falls in the 7th century AD (a conjunction of Saturn, Jupiter, and Mars on July 23, AD 690, in Libra) needs no correction, and is dead accurate. This date falls after 747 BC.

[\[return to text\]](#)

Note 17 --

The Egyptians never recognize the Moon. There is a total absence of the crescent of the Moon in depictions. Upturned crescents, as, for example, part of the headdresses of Gods and Goddesses, are based on symbols dating to before 3147 BC, and on graphic simplifications of cattle or ram horns, they are not based on the Moon, since the Moon never produces an upturned crescent at the latitudes of Egypt.

[\[return to text\]](#)

Note 18 --

Since the Katuns (and the implied Baktuns) were retrieved from ancient records, they were not retrocalculated, as at Palenque. The Katuns (and Baktuns) were most likely based on Tun years which were equivalent to solar years. A Baktun would thus be equal to 400 solar years, and a Katun would be 20 solar years, without regard to the actual length of the year. Thus the correction formula (below) is based first on subtracting 6 Baktuns (2400 years) from 747 BC to arrive at 3147 BC as the year of the end of the "Era of the Gods." Other corrections are thus found numerically as **3147 - 400*Baktuns - 20*Katuns**.

[\[return to text\]](#)

Note 19 --

Venus was probably orbiting the mass centroid of Saturn, Neptune, and Uranus, and thus somewhere at the level of Neptune. Venus could easily have been locked out of the reformed combined plasmasphere if its location managed to avoid the extension of the new plasmasphere in the direction away from the Sun, or, alternately, if it passed through this space in revolving around the Saturnian planets, and subsequently passed out of the combined plasmasphere. That would place it behind Jupiter from the slightly later point of view from Earth, after 3147 BC. This conforms to the notion of the Greeks (and only the Greeks) that Venus had been born from the head of Jupiter (Zeus), because it was first seen passing from behind Jupiter.

It might easily be suggested that the original diameter of the "gravitational sphere of influence" of Saturn shrank in the presence of the mass of Jupiter (which is three times that of Saturn). Shrinking a gravitational sphere of influence released the somewhat distant planets Earth and Venus from being carried along as satellites of Saturn. Away from other large masses, a sphere of influence is generally about 100 times the diameter of the parent planet -- 7 million miles (11 million km) for Saturn.

Mercury and Mars must have continued to travel with Saturn, for they show up near Earth about 80 years late. The Sumerian *King List* places Mars near Saturn in 3147 BC by virtue of the fact that only 80 years had passed since the last lowering of Mars. That time span is half of the earlier periods between lowering -- thus placing Mars closer to Saturn than to Earth.

With the following appearances after 3147 BC, Mars is accompanied by many asteroids, suggesting an aphelion in the asteroid belt. The movement of Mars and Mercury -- why they

returned to the region of the inner planets from the asteroid belt -- was governed by the gravitational attraction of the Sun, expressed as soon as Mercury and Mars fell away from the enclosing plasmasphere of Saturn. It can only be suggested that, like what we will see Jupiter do also, the plasmasphere of Saturn would have shrunk on reaching the asteroid belt. It can thus be suggested that these planets were released when Saturn's gravitational sphere of influence shrank as it entered the asteroid belt.

Note 20 --

The "tree" at Biblos of the *Isis and Osiris* story (by Plutarch in AD 100), is the plume of plasma impinging at the north magnetic pole of the Earth, after the change in the Earth's orbit in 3147 BC. The lodging of the coffin of Osiris in the tree is likely a ball plasmoid at the end of the plume. The polar plumes were presented in the text of a previous chapter.

Isis, in the shape of a swallow, flew around the tree which entrapped the coffin of Osiris. The swallow is possibly Mercury, which had polar plumes, because of an atmosphere (partially extant today). It had a split tail which additionally made it look like a swallow. The split plasma tail is typical of a body with only a limited magnetic field. Split tails have regularly been observed for comets over the last 400 years. The visual impression that a swallow was "circling" the tree of the north likely reflects Mercury's close passage to the Sun or the circling of the first northern polar plume.

This does not measure up to my other, later claim that Mercury only appeared with Mars at the end of the 80-year period. So, rather than the swallow being Mercury, it more likely is the planet Venus, who is Isis.

The fire lighted by Isis, where she roasted the baby of the Queen of Biblos, was seen also in antiquity, and is likely the lower portion of the plasma plume in arc mode. At a later date the Egyptians would identify the plumes as the braziers of the four cardinal points.

Note 21 --

I have only found one reference to a possible plasma discharge associated with Saturn after 3147 BC in the Maya *Chilam Balam* books, but I think it is a transcription error.

Blood and Alcohol

At this point I want to add some elements from the event of 2349 BC: the bloodbath by Kali, Hathor, and others, the intervention by Jupiter, and the worldwide celebration of the Day of the Dead.

... Kali

The Hindu Goddess Kali (Venus) goes on a blood-soaked killing rampage. Another God (Shiva) has to intervene to stop her. Kali is portrayed as black with black hair and black garments, if any. The same occasional hag-like appearances can be found among other descriptions of Venus as a raging madwoman, a witch, in Mesopotamia as well as in Mesoamerica. Venus would be a dark shape if the planet passed in front of the Sun during the daytime. The rotation of the Earth (plus the movement of a gyroscopic reaction) would make it look as if Venus raged across the sky a number of days.

Kali is black because she (Venus) was backlit by the Sun as it moved into a position of having the Sun, Venus, and Earth all in a line. The plasma tail directed away from the Sun would then point at the Earth. In that Venus has no magnetic field, the tail probably consisted of separate spikes

diverging from the centerline of the Sun-Venus axis, as is also seen in cometary tails. If these streams moved about in adjusting to the Earth's plasmasphere that they were passing through, Kali would be seen with flailing arms and legs -- in effect Kali was dancing.

I suspect the compressive contact with Venus was made in a region north of India. This would have tipped the equatorial rings up to move Kali into the midst of the blood-red rings (although the red color may have developed the next day). This was followed within a half day or less by a disconnected plasmoid from Venus (followed by 9 lesser plasmoids over the next day).

The gyroscopic reaction torque to the initial compressive shock (and the tipping back of the Earth's axis) would have rotated the Earth's axis counterclockwise, so as to move Eastern Asia (Russia) to face the Sun and shorten the day in India and Southern Asia. This probably accounts for the fact that the plasmoid "dragon" from Venus was seen in the Middle East, but not noted in India. That suggests perhaps six hours of travel for the plasmoid. That would place Venus at a distance of 12 million miles (19 million km) from Earth during this incident, if the plasmoid traveled, similar to the solar wind, at a rate of about 2 million miles per hour.

[\[note 1\]](#)

... Ku-Bau

From the Sumerian *King List* we have:

"After kingship was brought back to Kish again, Ku-Bau, the innkeeper, she who made firm the foundations of Kish, ruled for 100 years as 'king' before Kish was defeated."

Her occupation is also translated as "prostitute" or "barmaid" -- the last as yet another association with alcohol. She is probably Venus, but cannot be dated with certainty to the destructive appearance of the planet in 2349 BC, although her "reign" predates Sargon's conquest of Mesopotamia, which is listed somewhat later in the *King List*.

"In Kish, Puzur-Sin, son of Ku-Bau, reigned 25 years as king; Ur-Zababa, the son of Puzur-Sin, reigned 400 years."

Archaeologists date the barkeep Ku-Bau at circa 2400 BC (how amazing!). Puzur-Sin ("Moon"), her son, is estimated by archaeologists at circa 2360-2340 BC, and Ur-Zababa, the grandson at circa 2340 BC. Here is Venus as the barmaid, Puzur-Sin as the Moon, but I don't know who the grandson is (I suspect it may be the electrically active Moon stripped of its atmosphere). There was no 500-year delay before Sargon's conquest of Sumer, however, as presumably indicated in the *King List*. It happened at the same time as Ku-Bau's appearance.

Individual dynasties listed in the Sumerian King List often run simultaneously, or more likely list the extent of the lifetimes of the individual kings.

The association of what would be the smell of alcohol (or wild dancing) with some of the legends, and the association of the color red with all three of these tales (there are many more), might suggest an analysis of the possible chemistry of the gases and particulate matter of the Absu. It may have been a smell associated with brewing or fermentation. There will be similar suggestions of worldwide odors at much later dates, but these are recognized as sweet smells like the scents of flowers, or, as I would suggest, like diesel exhaust, and thus the burning of hydrocarbons like crude oil.

Ka-Bau (Kubaba) eventually is recognized as Kybebe (or Cybele) in Anatolia, and is adopted by the Romans as a goddess 2000 years later.

... Anath

Continuing further west, in the Levant the Goddess Anath of Ugarit goes on a "drunken rampage" extending from the location of sunrise to the Mediterranean sea. Here, too, the local chief God (Baal) has to intervene. Baal, of course, is Jupiter. Here, as in other tales, the dragon or goddess (now the plasmoid, rather than Venus) is described as "wading" in blood or gore (and in other descriptions as slapping her tail through the "waters").

The people of the Eastern Mediterranean saw the approach of the plasmoid from Venus. This lightning strike was not instantaneous; this took

time to travel. Leonard King wrote:

"We have long possessed part of another local version of the Dragon myth, which describes the conquest of a dragon by some deity other than Marduk; and the fight is there described as taking place, not before Creation, but at a time when men existed and cities had been built. Men and gods were equally terrified at the monster's appearance, and it was to deliver the land from his clutches that one of the gods went out and slew him."

"Tradition delighted to dwell on the dragon's enormous size and terrible appearance. In this version he is described as fifty beru (bêru) in length and one in height; his mouth measured six cubits and the circuit of his ears twelve; he dragged himself along in the water, which he lashed with his tail; and, when slain, his blood flowed for three years, three months, a day and a night. From this description we can see he was given the body

of an enormous serpent."

-- Leonard King, *Legends of Babylon and Egypt* (1918)

The "beru," a footnote mentions, was the space that could be covered in two hours' traveling. The apparition is thus held to be 400 miles (640 km) long (assuming 8 miles are covered in two hours' walking), and 8 miles (13 km) in width. The head of the plasmoid may have looked larger, in that it was closer to the observers. The size of the object in the sky might have been estimated by comparison to distant mountains.

The Goddess Anath of Ugarit is described as extending in size from the location of sunrise to the sea. This is similar to what is suggested above for the dragon.

The dragon apparition was not Venus, since Venus would have (or might have) blocked the Sun, being in a direct line with the Sun. This dragon with its enormous head was a plasmoid launched from Venus, an object lighted by its own arc mode plasma. As the Earth rotated toward the east the "head" of the dragon, a round ball of plasma with what looked like tentacles hanging from the mouth (the classical depiction of a dragon in China and in Mesoamerica), would first be seen in the south and then pass by, headed toward the west with the "tail" following behind it in the east.

... Leviathan

One of the beasts of the Bible which Yahweh conquered is Leviathan, mentioned in Job 41, and referred to in Psalm 68:30, as "the beast of the reeds." The reeds, again, describe the Duat.

The whole apparition, being brilliant enough to shine through the dust and particles of the Absu, had the appearance of being within the rings, "in the sea." It would have happened in the course

of a half a day, for the travel time of the plasmoid would not have lasted more than 6 hours. The Earth shock happened east of the region of the Eastern Mediterranean from which we have reports (and likely north of India). The contact with Venus would have been made as the Sun, Venus, and Earth were all in a line -- at noon local time. The plasmoid would have been launched very soon after the Earth shock, and was seen arriving by the people of the Eastern Mediterranean before night fell -- about 6 hours or sooner.

This was a time near the equinox, so that the day would normally have been about 12 hours long, but the reaction torque would have reduced the length of the day, moving the west part of the Earth faster toward the east, because of the swing made by the Earth's rotational axis. If the plasmoid traveled at a rate of two million miles per hour (3.2 million km per hr), which

is the speed of the solar wind after leaving the Sun, then Venus would have been at a distance of about 12 million miles (19 million km) from Earth at the time the plasmoid was launched. At a higher speed of travel (as I will propose), Venus would have been separated from Earth at a greater distance.

The tail would have grown in size as the plasmoid was viewed at an increasing angle. As it closed in on Earth, the rear tines of the plasmoid would become distinct and look as if they were wading through the rings of the Absu like the legs of a giant animal. The slashing tail is the collapse of the main body of the plasmoid delivered almost broadside onto the rings of the Absu, and exploding on reaching the electric field surrounding the Earth. For this reason Chinese dragons are depicted as contorted and twisted snakes with legs.

The dragon, as Tiamat, opened its mouth and swallowed the winds, whereupon she burst. So reads the Babylonian *Enuma Elish*, which I'll address further below. The winds were real; but resulted from the heat of the expanding air mass originally centered on Asia. Additionally, the explosive blast, followed later by additional plasmoids, would have sent scorching waves of heat to the Earth's surface. This too added to the winds.

... Hathor

Associated with the fall of the Absu in 2349 BC is the notion of blood everywhere. The blood-red condition shows up in tales of the destruction of mankind recorded in Egyptian New Kingdom tombs (Tutankhamen, 1327 BC; Seti I, 1279 BC; plus others down to 1136 BC, although these dates are held by Velikovsky to fall in the 10th to 9th century BC), where Hathor (Venus), as the lion-headed Goddess Sekhmet, wades in the blood of men and in red beer.

These New Kingdom texts replicate the written style of the Middle Kingdom, that is, the era in Egyptian history after the demise of the Old Kingdom in 2193 BC, and would thus date from long before the time when they were recorded. Most likely the tales date from 2349 BC, the same event (the "flood of Noah" and the fall of the Absu) which was also replayed shortly after 2349 BC by Unas in his Pyramid Texts, where he threatens to cut the throats of the celestial gods and disembowel them.

In 2349 BC, when Hathor (representing the plasmoid of Venus) starts to destroy humans and drink their blood, Ra (Jupiter), who had ordered the destruction, managed to stop Hathor when she went out of

control, by ordering the manufacture of 6000 jars of beer, dyed red with hematite (red iron oxide), to be poured out over the land. The Goddess drinks the beer, gets drunk, and ceases the killings. Ra retires soon after (which actually would have been 200 years later in about 2150 BC).

The story is recorded as the *Legend of the Celestial Cow*, so called because Ra also orders the creation of a celestial cow on whose back he then sits and leaves Earth. I have introduced the Hathor-cow earlier, in the chapter "The Gods Leave," related to the change in the electric field of the Sun. I suggested that the Van Allen belts would change to a glow mode display from the excess electrons spiraling back and forth along the magnetic field lines. After creating the cow's back, Ra next orders the creation of the cow's legs. (Is that a strange detail?) All this happens on the third day after Hathor's bloodbath. In this last detail the *Legend of the Celestial Cow* parallels other descriptions of the same events, as also in the detail that Ra then creates the southern stars. [\[note 2\]](#)

... Grendel's mother

In the Anglo-Saxon epic *Beowulf*, the hero Beowulf battles the mother of the monster Grendel in a cave under the sea (or a lake) over the course of three days. The mother of Grendel is yet another version of Kali, Tiamat, Anath, Sekhmet, and Ku-Bau. The "sea" (again) is the Absu. The cave is the Earth's shadow on the Absu. Beowulf rises out of the blood and gore of the lake at the ninth hour (3 PM) of the third day. It is strange that the poem actually mentions the time of day. This closely matches estimates elsewhere in the world of how soon after the earth-shock of 2349 BC Jupiter "rose from the dead."

The three-part epic recounts events of 3147 BC (Grendel's arm is torn off at his shoulder), 2349 BC (a bloody fight with a monster under water), and 685 BC (a battle with a fire dragon), aided in the last instance by one of his young cohorts, Wiglaf. Beowulf is played by Jupiter throughout, except perhaps in the last instance. The protagonists in all three parts are Venus or an associated plasmoid. Beowulf's display of the hilt of the sword which slew Grendel's mother is the southern polar plume seen from 55 degrees north latitude. Grendel's loss of his arm recalls the same detail as presented in the Maya *Popol Vuh*, where Hunahpu (Venus) has his arm torn off "at the shoulder" by Seven-Macaw -- the loss of the plasma connection of Venus with Saturn.

The alcohol seems to be missing from the Beowulf epic, perhaps because the tale was composed some 3000 to 4000 years after the events, although the central event, the attack by Grendel's mother, occurs after heavy feasting and drinking at Heorot Hall. For the more contemporaneous generation of the tales of Hathor, Kali, Anath, and Ku-Bau, there is a close

association between the arrival of Venus in 2349 BC and alcohol, as well as intervention by the chief God. The Babylonian *Enuma Elish* records this last also. It could therefore be suggested that Jupiter again assumed its giant coma and tail within 2 and a half days after September 6, 2349 BC (the date of the equinox at that time) to be reestablished and remain as chief God for the next 199 years.

I should also note that the 400 Lost Boys, recorded in the *Popol Vuh*, who become the Pleiades (at the time of the "flood of Noah"), are also "dead drunk" at the time they are blasted into the heavens by Zipacna, the mountain giant Jupiter.

Where did the plasmoid land? I suspect that it never reached the surface of the Earth. I think that it dissipated at the equatorial rings, but not without massive return strokes of lightning from the Earth's toroidal belts (the Van Allen belts, located above the atmosphere at the equator) into the equatorial ring system. The *Chilam Balam* mentions the return lightning strokes, as does the Chinese legend of the archer Li.

The Ten Suns

Having been introduced at this point to the black Kali of India, Anath of Ugarit, and Hathor of Egypt (Tiamat of the Babylonian *Enuma Elish* will be discussed later) -- all wading in the blood of slaughtered humans -- it is perhaps appropriate to tie together these "legends" and attempt to establish a sequence of events for the days of the 2349 BC event which are otherwise known as the "flood of Noah." Details are scant, but the following sequence seems reasonable.

India saw the approach of Venus, initially as a black mass occluding the Sun. The initial compressive Earth shock in Asia north of the Himalayas, due to the electric fields of the planets, was instantaneous. The seismic aftershocks to the repulsive electric force north of the Himalayas would have made Kali dance. The details of a bloodbath were only added the next day when the Absu had broken up into a red bath.

The seismic shockwave traveled in all directions, causing great damage, noted mainly southwest and west of the shock impact site, among sites from the Caucasus through Anatolia and across Greece. This condition would have been aggravated if there had been attempts at charge equalization through lightning bolts reaching the surface of the Earth. There was a lightning bolt, but it took 6 hours to arrive, and then apparently dissipated at the Earth's Van Allen belts or the ionosphere. This was, on the one hand, a peculiar interaction, and on the other, a grace for the Earth. We were spared the incineration of forests and prairies, and the loss of light for thousands of years. It is possible also, that the initial plasmoid landed in the Pacific. Water vapor in the atmosphere will not cool the Earth by blocking sunlight for hundreds or thousands of years. If the plasmoid was mostly absorbed by the ionosphere, it would have resulted in massive lightning strikes from the ionosphere or upper atmosphere to Earth's surface (under the condition of the upper atmosphere or

ionosphere inducing an opposite voltage at ground level).

The surface lightning strikes to Earth were thus not from Venus. From Venus came one very large plasmoid, and some nine additional smaller ones. Except for the damage done to the Absu by the first plasmoid, it is difficult to determine where these bolts landed and what the damage would look like. More on this further below.

The date of the shock can be established as occurring on the day of the autumnal equinox. This will be discussed in a following section. At the fall equinox the axis of the Earth would have been inclined forward -- in the direction of travel of Earth along its orbit. As mentioned earlier, the jolt to the Earth, above the equator, would have caused the spin axis to tilt away from the Sun, followed immediately by a reaction torque twisting the axis back toward the leading position of Earth's orbit, but in a counterclockwise direction (as seen from above). The effect would have been to bring the equatorial rings up to face Venus and the Sun, a condition probably accomplished within a few hours. The travel of the Earth's axis in this loop would have kept the broadside of the rings of the Absu facing Venus for about a half a day or a day.

This action is important, because the twisting of the axis may have kept the Earth from being incinerated, for the very next event after the initial shock was the release of the plasmoid thunderbolt by Venus. But it took time to reach earth.

The people of the Eastern Mediterranean saw the explosion, which, if my sense of timing is mostly correct, most likely happened over North Africa or the Atlantic or even further west. At this time the Eastern Mediterranean was turning away from the Sun and Venus at a faster rate than normal (the result of the gyroscopic reaction), and it was in Central America where the next phase of the spectacle was clearly witnessed.

As the day dawned in Mesoamerica, the arrival of secondary plasmoids was witnessed and recorded by the Olmecs, to be transcribed to garbled narrative texts some 3900 years later on separate pages of the *Books of the Chilam Balam*. The last page of Book 2 reads:

"Our gods have grown!" their priests said (those from [of] the Sun). And then days of the year were introduced."

"Behold abundant suns come,' they said. And the hoofs of the animals burned and the edge of the sea burned."

"This is the sea of bitterness!" they said."

"And the face of the sun was corroded, and its face became darkened and was put out. And then, above, they became frightened. 'It has burned up! Our god has died!' their priests said. And they were beginning to think about making a picture of the figure of the sun, when the earth shook and they saw the moon."

-- Antonio Mediz Bolio, *Books of the Chilam Balam of Chumayel* (1930) [\[note 3\]](#)

This single page of the *Chilam Balam* obviously refers to 2349 BC, with its reference to a new calendar ("days of the year were introduced" -- the Tzolkin), the disturbance of the Absu ("the edge of the sea burned"), and the arrival of the Moon ("the earth shook and they saw the moon"). The first line may refer to the initial plasmoid from Venus, seen in the east, but the phrase, "behold abundant suns come," describes secondary plasmoids of lesser intensity which followed on the heels of the initial dragon-sized bolt. [\[note 4\]](#)

The darkening of the face of the Sun can be attributed to the fact that the Sun would have sunk toward the south horizon as the Earth's axis tilted away (up) from the direction of the Sun. On the remainder of this page of the *Chilam Balam* a war ensues, with whole armies being shot down with arrows. This likely represents the lightning bolts traveling up through the Absu on the same or following days. China records the same. [\[note 5\]](#)

Except for the clear reference to 2349 BC, some of this text would have remained inexplicable if it were not for the fact that an almost identical description exists in China, as the legend of the "Ten Suns" which are shot down with the arrows of the celestial archer Li and which is placed "after the time of Yao." Both the Mesoamerican text and the Chinese text mention the multiple Suns, the heat felt on Earth, and the arrows directed up through the Absu. Li might be the Moon or a narrative fiction.

In China, daylight would normally arrive nearly a half day after it was daylight in Mesoamerica. But as the Earth's axis spun away from the direction of the Sun and simultaneously started to lean in the lagging direction of the Earth's orbit (initially), daylight and the secondary plasmoids, would have appeared hours earlier than normal. Otherwise it would be difficult to maintain that secondary plasmoids from Venus continued for as much as a day. The many suns were seen as rising, that is, in the east, and likely followed each other. The lightning bolts were launched individually. Nine were shot down. The last, the real Sun, remained.

And then it stopped, except for the bleeding of the sky. In India black Kali was now wading in blood. It stopped, observers noted, because a God had interfered. A sudden reappearance of the coma of Jupiter, on the second night after the day of the event, was the sign that this had happened. The timing of this is not entirely clear, though. In Babylon, in the *Enuma Elish*, written hundreds of years later, the rescue of Earth is attributed to a complete plan devised by Marduk before the onset of the plasma contact. But in India, the Levant, and Egypt, the God who quells the raging goddess acts shortly after the start of the killings. If the plasma expulsion of Venus (the plasmoid) also traveled past Earth, down the extended tail of the Earth's plasmasphere facing away from the Sun, it would have reached Jupiter (with Jupiter in line with Earth) in about 6 days and caused it to switch to a glow mode coma. This assumes a speed of about two million miles per hour (3.2 million km per hr).

It could have been sooner, however, for coronal mass expulsions (a dense plasma) from the

Sun have been known, in recent times, to travel on occasion at a rate of 200 million miles per hour (320 million km per hr), rather than 2 million miles per hour. At a somewhat higher speed of six million miles per hour, it would have reached Jupiter (at that time located at 4.5 AU from the Sun, and thus about 3.5 AU from the location of Earth) in two and a half days. The worldwide celebrations of the "Day of the Dead," which will be introduced below, almost uniformly last two and a half days. [\[note 6\]](#)

If Jupiter blazed, suddenly, two and a half days after the Earth shock, as the tremors from the shock lessened and the sweeping hurricanes abated, and after experiencing the plasmoids from Venus, Jupiter would have been understood as the savior of the Earth. Only the blood in the "ocean" remained.

The bleeding of the dragon lasted, one of the above sources notes, for 3 years, 3 months, one day and one night. The time for the complete fall of the Absu can be compared to the various times that flood survivors spent floating in their various boats and arks, which, of course, is nowhere near three years. In most myths the extent of the flood is much shorter, although these tales represent references to the flood of 3147 BC. Noah, in the Biblical story spends a much longer time afloat, but not three years.

I also do not know if the Absu was originally colored red, although it could be suspected that at least part of the rings may have been. Some low-density gases will glow in red when ionized and under electric discharge, as is seen today in the Aurora (and in the rings of Saturn). If the Absu had always been red, we would never have heard anything about it. More likely, it was a condition of 2349 BC due to a continual plasma discharge via the equatorial rings. The *Chilam Balam* claims that the whole world turned red at this time, and attributes the condition to Jupiter. Another page of the *Chilam Balam* claims that the condition only lasted past the ending of one Katun, and partway into the next -- 18 or 20 years.

Blood would have been everywhere in the sky. It was near the fall equinox, and at night the Absu would have been divided by the long shadow of Earth. Based on Maya iconography it appears that by coincidence Jupiter appeared in the very center of the gap of the Absu as it expanded into a giant form. As the rotation of the sky, due to the gyroscopic reaction, neared completion at about this time, then Jupiter would have been seen as rising from within the gap. Actually, the Absu lifted up again against the background of the stars as the Earth resumed its normal tilt -- at the same time that Jupiter suddenly developed a large glow mode coma and a giant expulsion of plasma below the coma, its mountain.

With the initial gyroscopic condition of the Earth tilted away from the Sun, the gap created by the shadow of the Earth would have closed to become a cave or doorway to a cave. Returning the Absu, or what was left of it, to its normal position against the backdrop of the stars, would also move the shadow of the Earth up against the rings. This would make it look as if the cave exploded open as Jupiter moved up and out.

This is confirmed from a number of Mesopotamian seals, dated to shortly afterwards, which depict Jupiter rising from between two mountains. This is correct for an alignment of the Sun, Venus, Earth and Jupiter. But there is much more that confirms this condition from throughout the world.

The Day of the Dead

Moe Mandelkehr, in *The 2300 BC Event* (2006), assumes that the events of 2349 BC and 2193 BC can be represented as a single incident of a fall of meteorites in about 2300 BC and the subsequent creation of a series of circumpolar rings which lasted some months. The book, in three volumes, includes a wealth of information, of which the details of a worldwide celebration of a "Day of the Dead," centering on the culmination of the Pleiades in the south sky, is the most interesting and bears directly on the topic of this chapter. (A culmination is when a star reaches the highest point in the sky directly above the south cardinal direction at midnight.) He opens with a quotation from W. T. Olcott which effectively sums up the information he presents. [\[note 7\]](#)

"Memorial services to the dead at the season of the year when the Pleiades occupied a conspicuous position in the heavens are found to have taken place, and to have been a feature in the history of almost every nation of the earth, from remote antiquity to the present day."

"The universality of this custom may well be considered one of the most remarkable facts that astronomical history records. ... A great cataclysm ... is in some way associated with the Pleiades, and some reference to such an event can be traced in many of the legends and myths surrounding these stars that have come down to us from nations far removed from each other."

-- W. T. Olcott *Star Lore of All Ages* (1911)

Mandelkehr provides details spanning all continents and both hemispheres. He records the festivals worldwide as celebrating new-year, fire-lighting, and commemorating the dead. He lists details for Britain, Scandinavia, continental Europe, Greece, the Middle East, Israel, Africa, Egypt, Iran, India, Central Asia, China, Japan, the Pacific islands, North America, Mexico (Aztecs), Central America, South America, and Peru. Not all the references are solid and convincing, and some have nothing to do with the topic at hand, but there are certainly more than enough to build a case for a "Day of the Dead" celebration worldwide which had its genesis in remote antiquity. Today this festival is institutionalized in the Christian world as "All Saints Day" and "All Souls Day," and celebrated in other forms, as "Halloween," for example, and as the "Day of the Dead" in Mexico. [\[note 8\]](#)

Mandelkehr associates the Pleiades with the autumnal equinox in 2300 BC, based on a retrocalculation from the current constitution of the heavens. As the Sun sets in the west, the

Pleiades would have risen in the east. Six hours later, at midnight (sidereal time), the Pleiades would have stood at their highest point in the south sky, a culmination.

The same information is found in Book 10 of the *Chilam Balam*, which mentions that after the fall of the Absu ("the baptism from the center of heaven") the ecliptic and equatorial became visible (as "the crossroads") with the Pleiades ("precious things," as seed corn is called) above these. Details in the chapter "The Chilam Balam."

The fact that an ephemeris will show the Pleiades culminating in the south skies at the autumnal equinox in 2300 BC, is actually a nagging coincidence, for my supposition (developed in later chapters) is that the skies were different and invariant before 685 BC. As it happens, the condition of the sky before 685 BC can be simulated (except for the zero longitudinal line and the horizon) by selecting the year 2000 BC with an ephemeris. This is very close to the retrocalculated conditions for 2300 BC, so that the Pleiades indeed stand at their highest point in the south skies on our equivalent date of September 21 on an equivalent Gregorian calendar -- the autumnal equinox by our accounting. [\[note 9\]](#)

The shift of 15 days experienced in 685 BC almost entirely accounts for the coincidence of the Pleiades appearing at the autumnal equinox in 2300 BC by retrocalculation.

The festivals noted by Mandelkehr for earlier ages occur near the expected culmination of the Pleiades in the sky at midnight in late October or early November. These dates have drifted away from the equinox because the culmination of the Pleiades moved later into the fall of the year after 685 BC due to the precession of the equinoxes (after 747 BC). The dates for many of the "Day of the Dead" celebrations do not recognize the equinox, but only the dates at which the Pleiades stand highest in the sky.

Yet it is also curious (as related by Olcott) that many of these festivals, where they are still celebrated today, start about 15 days early -- 15 days before the Pleiades reach their highest location in the sky. This agrees with what I will develop in the chapter "Modern History": that the equinoxes moved 15 days into the future after 685 BC. Before 685 BC the fall equinox fell on the equivalent calendar date of September 6th. (This also agrees with the earliest Mesopotamian records which inexplicably place the equinoxes in the constellations Taurus and Scorpio.)

This probably accounts for the 15-day discrepancy between when many of the "Day of the Dead" festivals are observed today and the actual calendar date of the culmination of the Pleiades. But whereas some people used calendar dates for the celebrations (15 days early), others followed the changing dates of the culmination of the Pleiades, and yet others kept the celebration at the date of the equinox, and in some cases, apparently, returned to the earlier date of September 6 of the equinox (noted by Mandelkehr). [\[note 10\]](#)

The information to be gleaned from Mandelkehr's book is unfortunately insufficient to make any determination of how these various dates for the celebrations may have developed

historically, except in a few instances. Although he points to festival dates "around the end of October and beginning of November," he almost never makes note of when in the past these were celebrated. At best this might suggest that festivals seemed to have kept pace with the changing date of the culmination of the Pleiades over the last 2600 years.

It is, however, clear that at various times in the past some of the festivals were codified, that is, tied to a certain calendar date rather than continuing to follow the changing date of the culmination of the Pleiades. We see this in the Christian "All Saints" and "All Souls" days. These were set as a church feast day in about the year AD 700 or AD 1000, purposely coinciding with the "Day of the Dead" celebrations of the European tribes, celebrated, at that time, at the culmination of the Pleiades on October 31, Gregorian. Once tied to the church calendar, this feastday remained locked to October 31 and November 1, with allowances made by the church to continue the celebrations over two days. The pagan Halloween evening festival also kept pace with the church calendar.

A similar codification can be seen in Mesoamerica before the Spanish arrived. Mandelkehr, quoting Bernadino de Sahagún from a secondary source, notes that a "Day of the Dead" celebration occurred on October 20 in the 16th century AD. [\[note 11\]](#)

Interestingly, the primary God of the Aztecs, Huitzilopochtli, celebrated his "birthday" on November 9 (Gregorian), when the Spanish arrived in the 16th century AD, which was the actual day of the culmination of the Pleiades at that time. Huitzilopochtli is generally equated to the planet Mars, but the coincidence with the date of the culmination of the Pleiades would suggest that Huitzilopochtli may need to be equated with Jupiter, or that he was originally equated with Jupiter -- who, 3900 years earlier had reappeared from death on the day of the culmination of the Pleiades.

All the festivals honor the dead, light fires, and include torchlight parades. Many at one time marked new-year day. Invariably the celebrations last three days, or two days preceded by an evening festivity, even in Mexico of the 16th century AD. I think this is important in pointing to a series of closely related events, and I would suggest that the fall of the Absu, which was an absolutely terrifying event, would have been closely followed -- in fact, by two days and a night -- by the reappearance of Jupiter in his full mountain-sized form. "After three days he rose from the dead." [\[note 12\]](#)

"Who died?" As I have suggested above, it may have been only Jupiter who died and rose from the dead. The giant coma of Jupiter had disappeared from the sky, as noted in the *Chilam Balam*, sometime before 2349 BC. Although Mandelkehr assumes millions died from comet fragments (ice cubes?) falling from the sky, I think few people died, excepting those in the regions struck by the electric repulsive shock and the traveling seismic disturbances which devastated the landscape -- possibly affecting a large portion of the Earth. Sodom and Gomorrah suffered their initial destruction in the collapse of buildings at this time (which were rebuilt). Some regions of Earth would have been absolutely devastated, as Claude Schaeffer has pointed out. But it was the "blood" seen in the "ocean" which would have

convinced the rest of the world that indeed millions of people had died.

The Twin Peaks

The appearance of Jupiter three days after the dragon had arrived and turned the sky to blood, formed an image which entered Christianity and is retained to this day.

The image is one of Jupiter suddenly appearing, when he had been held as dead at an earlier time. He appeared in the center of the gap of the Absu, two days after the fall equinox. Jupiter's coma was at this time three times the diameter of the Moon (so says Plutarch), with plumes spreading out from the top of the coma, and an absolutely gigantic plasma outpouring below, as the three leaves of a flower, but much denser so as to look like a solid mountain. The Olmecs, with a view of the ecliptic much higher in the sky, depict Jupiter's body as the open mouth of a cayman or alligator (which have short tongues).

Because it was the time near the fall equinox, the Absu at this point had opened up and split into two mountains. The umbra of the Earth's shadow extended across the rings, becoming less wide further from Earth. But the penumbra widened with distance from Earth, in effect rounding the left and right halves of the Absu from the center. The result was to have two mountains -- twin peaks -- next to each other, with Jupiter centered on the valley between the mountains for some hours on the night of September 8th. Since this was the time of the fall equinox, Jupiter (on the ecliptic) would rise above the equatorial in the following weeks and months anyway, reinforcing the concept of rising up out of a depression.

[Image: Shamash rises from between the two mountains. Dawn and dusk, or east and west, are shown as flag standards. After E. A. Wallis Budge.]

In the print of an Akkadian cylinder seal, shown above, dated to slightly after 2349 BC, an absolutely giant Shamash (Jupiter) is seen stepping out of the gap between twin mountains, the left and right halves of the Absu. The symbols on both sides of Shamash are partially schematic and partially in script. The right symbol of a star, meaning "heaven" or "holy," is placed on a pole rising out of the glyph for "mountain." Schematically it represents the earlier polar configuration. The left symbol I do not know.

Cylinder seals are small cylindrical stones carved in intaglio, used to roll across a clay slab to be used as a marker of ownership on trade materials. These appear after 2350 BC, although there are also seals dating to shortly after 3000 BC.

The rays rising from the upper arms of Shamash represent the upper plasma of Jupiter as three separate plumes. At other times this resulted visually when the planet dipped below the top level of the Absu and its light was diffracted by the structure of the rings. It thus signified the brilliance of the planet. The same rays show in depictions of Venus, for the same reason.

[Image: Ishtar (Venus) and Ea (Sumerian Enki) aid in the resurrection of Shamash (Jupiter); circa 2308 BC. After crystalinks.com]

Flanking the twin mountains are flag standards (with small lions on top), held in place by two gods. The two flags are what was seen of the equatorial plasma toroid surrounding the Earth (the Van Allen belt), which showed up whenever it was energized to glow mode. This was thus a temporary phenomenon, and represents two of the four posts holding up the heavens. These would rise up from the east and west cardinal directions of the horizon, follow the curvature of the equatorial and be truncated by the shadow of the Earth at the time of the equinoxes. It thus reached considerably above the rings of the Absu, which everywhere appeared below the equatorial. These two forms did not move significantly, except that they may have fluctuated in density so that they seemed to waver. This would cause them to be represented as flags, just like in Mesoamerica they are held to be trees.

The lion shown on top is an interpretation (I suspect) of the cross-section of the toroid where the Earth's shadow fell across it. At later instances a circle is shown, which is closer to being correct, because the equatorial toroid would be densest at its outer edges. Because of this ring at the top, these forms are also identified as doorposts (the ring forming the upper "hinge"), and texts describing the appearance of Shamash refer to "the doors of heaven opening."

The above impression of a somewhat later cylinder seal (2300 BC) shows what really happened. Here the Goddess Ishtar (Venus) and Ea (Mercury) attend the resurrection of Shamash. The script at the left reads "place of purification." That puts a different twist on the event of 2349 BC, as if Jupiter is being baptized. The seal still represents the event of 2349 BC, although at this time the Absu has long since disappeared. The flag standards are gone also.

Within the next few hundred years the Babylonians will spin a new theology with the writing of the *Enuma Elish*, which will bring Jupiter forward as the main character in the event of 2349 BC, under the name of Marduk. The *Enuma Elish* retains the attack by the dragon (Tiamat) and the blood in the skies, but removes the resurrection of Jupiter. Despite the importance of this new retelling of the drama, the fact that Jupiter (Shamash, Zeus, Jove), the most important God of antiquity, had returned from the dead in three days was long remembered -- parts of this tale are replayed a thousand years later in the telling of the Exodus story (the mountain, the sea split open), the resurrection of God is retold many times in many differing religions, and even 2300 years later it entered the Gospels.

[Image: The Corn God (the First Father, Jupiter) rises from a crack in a turtle

carapace, attended by Xbalanque and Hunahpu. After Freidel and Schele, "Maya Cosmos" (1993)] [\[note 13\]](#)

In Egypt Ra, Jupiter as the midnight Sun, is always shown as a giant red globe, at times depicted in the saddle between two mountains, or hovering in a valley between two mountains. The mountains, in turn, are shown covered by what looks like rows of reeds. Such depictions are quite late, during the New Kingdom (after 1500 BC), and thus a thousand years removed from 2349 BC. At that time Ra is shown without his lower mantle or the three-pronged plumes at the top -- just a red sphere.

Although in Mesoamerica the depictions are 3000 years removed from the actual event, the sculptures and engravings are based on very old records extant at the time of the Classical Era (AD 400 to 900), and at times uncannily accurate. The image above is of the resurrection of Jupiter from a crack in a turtle shell. It represents a mixture of events separated by thousands of years. Here Jupiter is shown as the Corn God or as the First Father.

The "image of the turtle" had first appeared in 10,900 BC. The nearest of the three plasmoids likely gave rise to the second and third ball plasmoid of remote antiquity, as if rising out of the nearest ball plasmoid. What is depicted here is the first appearance of Jupiter as the new ruling god in 3147 BC, and additionally his resurrection in 2349 BC. Hunahpu and Xbalanque are assisting him, even though their actions date from shortly before 685 BC. But in effect they are the same two gods in attendance as in the cylinder seal shown earlier -- Ishtar and Ea. The two monster heads below Hunahpu and Xbalanque represent the two-headed plasmoid from Jupiter of 685 BC.

A portion of many Maya commemorative stelae have reference to the completion of a previous creation. They read, "... on 4-Ahau 8-Cumku was (first) seen the image of the turtle." This is a reference to an ending of the first creation, which included the 2500 years of appearances of the ball plasmoids of the south, ending in 8347 BC. The appearance of First Father ("Hun-Nal-Ye," Jupiter) is dated (here) to the beginning of the current calendar round in 3147 BC, when Bolon-ti-ku, Jupiter, seized the reign from Oxlahun-ti-ku, Saturn, as told in the *Chilam Balam*.

Other references to the creation on the date 4-Ahau 8-Cumku point instead to the placing of the three hearthstones in the sky. These are held (with certainty) by archaeologists to be three stars in the constellation Orion (one belt star and his two feet, enclosing M-42 as the fire). I would suggest that the reference actually is to the start of the "first creation" of 10,900 BC when the three ball plasmoids first appeared in the southern sky.

Hunahpu and Xbalanque, on the other hand, show up in the 120 years between 806 BC and 687 BC, as the twins Mars and Mercury, except in the last instance when they are Venus and Mercury. Since the celestial twins, as told in the *Popol Vuh*, attempt to raise their father from the dead (although without success), an association is had here to the resurrection of First Father. The *Popol Vuh* does not allow success in the efforts of the twins to revive their father,

but the theology of other Maya centers speak differently, as is shown by this imagery.

Marduk and the *Enuma Elish*

Jupiter had lost its tail and coma (had died) some time before the "flood of Noah." There is a passage in the Babylonian *Enuma Elish* which tells of this. The express purpose of the *Enuma Elish* was to establish Jupiter (Marduk) as the chief God and to resolve a religious crisis in Babylonia. In the *Enuma Elish* Marduk is installed by the other Gods and invested with power in order to fight common enemies of the Gods, among them Tiamat ("chaos") and Absu ("the abyss"). Marduk asks only that,

"... an 'unchangeable command' might be given to him -- that whatever he ordained should without fail come to pass, in order that he might destroy the common enemy. ... The testing of his newly acquired power followed. A garment was placed in their midst:"

*"He spake with his mouth, and the garment was destroyed,
He spake to it again, and the garment was reproduced."*

-- Theophilus Pinches, "The Religion of Babylonia and Assyria (1890)

The Akkadians (and Babylonians) changed their dress after circa 2500 or 2400 BC from skirts to shoulder-hung robes. The climate had become colder. The century marked the end of the Hypsithermal. (Or we are seeing a change in fashion, which is unlikely.) The Babylonian priests did not spin tales out of whole cloth. The reference to the disappearing and reappearing garment -- it was Marduk's own -- was remembered by everyone, or talked about by their grandfathers. "Mountain" and "skirt" are the same word in Akkadian. The reappearance of Marduk's mountainous plasma tail skirt coincided in time with the arrival of the plasmoid of Venus, the fall of the Absu, and the later arrival of the Moon.

The exploits of Marduk are briefly related as follows:

"Neither An nor his son Ea knew words of power strong enough to subdue Tiamat, but Ea's son Marduk, the patron god of the city Babylon, took on the task of fighting Tiamat in return for his being proclaimed king of the other gods."

Tiamat, whom Marduk is to battle, is the plasmoid of Venus.

"They gave him power to destroy things with a word and made him their king."

"He, in turn, took his bow, the rainbow [actually, the polar plasma plume] that arches across the sky, and his lightning arrows and made a great net to ensnare Tiamat, and riding the winds of seven great storms he went to do battle with her. When he threw his great net upon her, she opened her jaws to swallow him, and the winds that Marduk controlled rushed into her mouth and swelled her belly until it burst."

"Then Marduk cut Tiamat's body in half and raised up one half to make the sky, leaving the other half as the restless oceans."

-- quoted by L.C. Geerts at <http://Earth-history.com>

Tiamat is not an Akkadian or Sumerian Goddess -- but she is female. Tiamat is an invention of the Babylonians, but identified as a dragon. What a sight, to have Tiamat distend and blow up! Here Tiamat is the first plasmoid from Venus in 2349 BC. The Absu, of which nothing more is heard of in all of the *Enuma Elish* after initial mention, becomes one of Marduk's weapons, "the net," along with another, called "the flood." Obviously the *Enuma Elish* was written well after the actual facts had started to fade.

Marduk at this telling of the *Enuma Elish* has become a creator God. The relationship of the *Enuma Elish* to the time period of 2349 BC, however, is clearly indicated by the tasks undertaken by Marduk after defeating Tiamat. Theophilus Pinches, in *The Religion of Babylonia and Assyria* (1890), writes:

"Then came the ordering of the universe anew. Having made a covering for the heavens with half the body of the defeated Dragon of Chaos [Tiamat, the Venus plasmoid], Merodach [Marduk, Jupiter] set the Abyss [the Absu], the abode of Nudimmud [Ea], in front, and made a corresponding edifice above --the heavens -- where he founded stations for the gods Anu, Bel, and Ae."

"Stations for the great gods in the likeness of constellations, together with what is regarded as the Zodiac, were his next work."

"He then designated the year, setting three constellations for each month [an Egyptian decan, and thus 30 degrees], and made a station for Nibiru [Venus] -- Merodach's [Marduk] own star -- as the overseer of all the lights in the firmament."

"He then caused the new moon, Nannaru, to shine, and made him the ruler of the night, indicating his phases, one of which was on the seventh day, and the other, a /abattu/, or day of rest, in the middle of the month."

China

These activities duplicate what the Chinese Legendary Emperor Yao accomplishes in the same era: adjusting the calendar, revealing the planets and stars (now that the equatorial rings had fallen), and setting the Moon in place.

The Chinese *Annals of Shu* were subjected to chronography by the Han between 200 BC and AD 200, and possibly earlier by the Taoists (and there are also comments about estimates by Confucius's disciples). But many of the names on the lists of kings had missing reign lengths, so that averages were used. Dynastic lengths seem to have been better established.

The story of the mortals Khwan and his son Yu forms a parallel to the story of the gods Yao (Jupiter) and Shun (the Moon). We are told that Khwan started drainage of blocked waters on a commission by Yao. The *Annals of Shu* record that in failing to accomplish this, he was kept prisoner on a mountain until his death. His son likewise was hired by Shun for the same purpose and additional tasks; he was appointed to the throne by Shun and survives him to become the first king of the Xia.

Unas and the *Book of the Dead*

Unas, at the end of the 5th dynasty, 2345 BC, is the first pharaoh to add text of the *Book of the Dead* to the interior of his pyramid (as do all the following pharaohs), perhaps being no longer convinced that the recitation by the priests will suffice. If the dates for Unas are correct, then he witnessed the fall of the Absu in 2349 BC. [\[note 14\]](#)

Much Later, in 2193 BC the Old Kingdom will end because of the failure of agriculture. When it is finally reconstituted as the Middle Kingdom 200 years later, it is as if nothing had happened. Egyptian religious practices continue with the old traditions of Horus, Ra, and Osiris. It was Unas who introduced the full-fledged theology of Osiris with his pyramid inscriptions. The worship of Osiris was new at the time of Unas.

There are no literary references to Osiris before the time of Unas. It suggests that the texts of the pyramid of Unas were meant to promote Osiris. As Jane Sellers, in *The Death of Gods in Ancient Egypt* (1992), writes:

"At the beginning of the Sixth Dynasty another change took place. The religious fervor honoring the sun god [Re] which had marked almost all the efforts of the Fifth Dynasty, shifts its emphasis to the worship of Osiris. It is in the pyramid of Unas, last ruler of the Fifth and in the pyramids of rulers of the Sixth Dynasty, that texts were now inscribed, and it is in these Pyramid Texts that the role of Osiris is predominant."

"Sir Alan Gardiner has written that the Pyramid Texts had the sole aim of insuring the deceased ruler's identity with Osiris and insuring that the king would fare as Osiris had."

The reference is to Sir Alan Gardiner, *Egypt of the Pharaohs* (1961). There are references in the pyramid texts of Unas to the bloodbath of Hathor of 2349 BC, although not directly, but displaced as actions by the dead pharaoh.

Sellers again:

"In the Fifth Dynasty some of the kings began a use of a name compounded with that of Re [Note: this actually started during the Fourth Dynasty], and the nomen was now used less often on the monuments; concurrently the building activities now centered on sun

temples. By the end of the Fifth Dynasty, however, the worship of Osiris (as evidenced in the Pyramid Texts [of Unas]), appear to rival the worship of Re. From these changes Egyptologists have concluded that competing groups worshiped Re and Osiris."

Sellers quotes J. Gwynn Griffiths, from *The Origins of Osiris and His Cult* (1960), as:

"While there is every likelihood that the Osirian material in the Pyramid Texts derives in part from a much earlier date, so far it has proved not possible to track down the god or his symbols tangibly to the First or Second Dynasty."

Let me: Osiris is always shown as a mummy, and consistently colored green. Although depicted as a green mummy in the middle kingdom, the actual green color dates from after 3147 BC to about 2914 BC. This is the green mummified creation-god Ptah of Memphis. He lived forever and is first king of Egypt. Why have the experts not noticed this? He is equated with Hephestus (who is Venus) by the Greeks and married to Sekhmet (who also is Venus), and wears the Osiris crown. I could add more aspects identifying him with Osiris. How could Sellers have missed this?

This is the same green that describes the mountain form of Jupiter in the *Popol Vuh* -- where he is simply known as "Mountain" (and as the "green tree of the center" in the *Chilam Balam*). Osiris thus is Jupiter, but in a form only recalled or recorded by one or more of the Egyptian temple domains. It is the form assumed by the planet Jupiter until it entered the asteroid belt in circa 2914. The mummy form of Osiris also recalls (or is) Min, the delta God from circa 3100 BC. Both are shown as ithyphallic. Min is thought to be the first pharaoh of the first dynasty, Menes -- "mn" in Egyptian, "he who endures" -- and thus Jupiter.

I am pointing out the sudden interest in Osiris because it was not new at all, and interestingly, the recollection from an earlier time is correct. The Osiris tale can certainly be tied to the reappearance of Jupiter directly after the arrival of the plasmoid from Venus. Additionally, at a later time, a day in the calendar is designated as the commemoration of the death of Osiris, with a day three days later as the date Isis brought him back from the dead, although temporarily. There is an inversion of sorts of closely related events, as is not untypical of a number instances in antiquity. But here again is the interval of three days (two days and a night) between the sky turning blood red and the sudden reappearance of Jupiter with a lower plasma mountain.

Jupiter probably had lost its coma before 2349 BC, that is, had "died" earlier. Thus in the narrative "legend" of Osiris there is a temporal connection for which there is only a tenuous claim in reality, based on what we know or have been told. All the same, this particular claim -- the death of God followed by his resurrection after three days -- will resound in other legends and in religious claims throughout the ages. The God Marduk of Babylon and Ashur of the Assyrians each also die and are resurrected.

As I mentioned above, Unas, whose tomb walls were inscribed with the texts and spells of

the *Book of the Dead*, most likely witnessed the fall of the Absu and the blood in the sky. This is almost certain from consideration of the following engraved Pyramid text. E. A. Budge, in his introduction to the translation of *The Egyptian Book of the Dead* (1895) notes a section of the Pyramid Text from the tomb of Unas which is totally out of character with the other texts dealing with the material and spiritual enjoyments of the deceased. He writes:

"... the most remarkable passage in this connection is one in the pyramid of Unas. Here all creation is represented as being in terror when they see the deceased king rise up as a soul [ba] in the form of a god who devours 'his fathers and mothers'; he feeds upon men and also upon gods. He hunts the gods in the fields and snares them; and when they are tied up for slaughter he cuts their throats and disembowels them. He roasts and eats the best of them, but the old gods and goddesses are used for fuel. By eating them he imbibes both their magical powers, and their 'khu's.'"

Budge quotes the actual passage, of which I will only reproduce the opening line:

"The heavens drop water, the stars throb, the archers go round about, the bones of Akeru [mythological guardians of sunrise and sunset] tremble, and those who are in bondage to them take to flight when they see Unas rise up as a soul [ba], in the form of the god who liveth upon his fathers and who makes food of his mothers."

Unas has here been transformed into the plasmoid of Venus at the fall of the Absu, just as, in other retellings, Hathor had appeared as the lion-headed Goddess Sekhmet in the form of the eye of Horus. Unas here also wades in blood and gore, while the sky fills with water and fire, and arrows are launched, as also on a page on the "third creation" of the *Chilam Balam*. There is little doubt that the priests took advantage of the event of 2349 BC to offer an additional spell to be added to the texts (these were carved before the pharaoh died). It is also certain that the sudden change in religious emphasis -- especially in the worship of Osiris -- was initiated by this absolutely stupendous cataclysm.

Chronology of the 24th and 23rd Century BC

At this point we can collate some dates. The dates below concern four events:

- the fall of the Absu,
- the first appearance of the Moon,
- the "death" of the Moon or the time when it settled into a regular orbit around the Earth, and
- the extinction of Jupiter.

We have these dates from the following sources:

- the *Annals of Shu*,

- the *Chilam Balam*,
- Ussher's chronology, and
- the inscriptions at Palenque.

I have added the four suspected passes of Venus, assuming an interval of 52 solar years. (See Appendix B, "Celestial Mechanics" for the validity of the 52-year cycle during this era.) In the following, read "sb" as "should be."

Fall of the Absu, appearance of Jupiter (Yao)

- 2349 BC - first contact with Venus
- 2349 BC - Ussher: flood of Noah
- 2286-2266 BC - Chilam Balam: The second baptism (see comments)
- 2357 BC - Annals of Shu: Yao takes the throne
- 2357 BC - Annals of Shu: Khwan on the inundation
- 2360 BC - Palenque: the three planets born (sb 2336.8 BC)

The Moon (Shun) appears in orbit

- 2297 BC - second approach of Venus
- 2325 BC - Palenque: Moon lets blood (sb 2302.3 BC)
- 2318 BC - Annals of Shu: Birth of Shun (Moon)
- 2305 BC - Palenque: Moon becomes ruler (sb 2282.6 BC)
- 2287 BC - Annals of Shu: Shun joins Yao on throne

The Extinction of Jupiter (Yao)

- 2245 BC - third approach of Venus
- after 2247 BC - Ussher: "Tower of Babel" (may be 2150 BC)
- 2257 BC - Annals of Shu: Yao dies

Fall of Akkad and the Old Kingdom

- 2193 BC - fourth approach of Venus (electric contact)
- 2207 BC - Annals of Shu: Shun (Moon) dies
- 2205 BC - Annals of Shu: start of the Xia dynasty
- 2193 BC - fall of Akkad and the Old Kingdom
- 2128 - 2108 BC - Chilam Balam: "fire on high" (sb 2167-2147 BC)
- 2155 BC - Annals of Shu: Celestial Phenomena
- ca 2150 - Cylinder of Gudea: splendor of Ningirsu
- 2150 BC - extent of Abraham's lifetime

- 2150 BC - likely "Tower of Babel" event

The records of Mesoamerica as reflected in the *Chilam Balam* accurately record dates, which in deep antiquity probably consisted of Baktuns (periods of 400 solar years) and Katuns (periods of 20 solar years). These can be converted to solar years, if we can guess the Baktun associated with any recorded Katun. Unfortunately, some dates around 2349 BC seem to be in purposeful disorder.

The dates from the sculptures at Palenque of AD 700 will require conversion to solar years (equivalent Gregorian years) on a somewhat different basis, for the Maya at this time calculated in Long Count measures identical to how we use these today, that is, by assuming that the year was 365.24 days long. [\[note 15\]](#)

The Chinese *Annals of Shu* record estimated reign lengths. Because many were missing when these records were compiled, dates were estimated in about 200 BC by Chinese historians. If we equate the date of 2357 BC from the Chinese *Annals of Shu*, the date Yao takes the throne, to the date of 2349 BC (the "flood of Noah"), then the first few dates of the Chinese *Annals of Shu* should be moved 8 years into the future. Dates concurrent with the Xia dynasty can probably be taken as correct.

There may be better concordances of the dates than what I have presented here. One of the really suspect dates is Ussher's Tower of Babel event, which he casually places a hundred years after the completion of the "flood of Noah" at "after 2247 BC" -- it should be set in 2150 BC.

To adjust the dates derived from the records of various peoples, I am using Ussher's date of 2349 BC for the "flood of Noah" as an anchor. This is the fall of the Absu which happened because of the electric contact by Venus and which caused a change of the Earth's orbit to near the Moon. The change of the orbit of the Earth is even noted in the Bible when it is suggested that men's lives were shortened after the flood -- the year had become longer. In the *Annals of Shu* Yao takes on the task of calendar reform at this time. In the Babylonian *Enuma Elish*, Marduk (Jupiter) also establishes a calendar after battling Tiamat. Book 11 of the *Chilam Balam* claims "*and then days of the year were introduced*" as an aspect of the Third Creation. The Third Creation is the event of 2349 BC. [\[note 16\]](#)

The date for the fall of Akkad is archaeologically well-established as 2193 BC, 156 years after the "flood." The period of 156 years is three times the 52-year interval between approaches by Venus -- an interval still seriously observed by Mesoamerica in AD 1500, but in Tun years instead of solar years. I have calculated estimates of the changing intervals in the appendix "Celestial Mechanics." [\[note 17\]](#)

Recap and Reactions

The 24th century BC was important. The second break with the elder Gods took place during this time, and it happened in the course of a hundred and fifty years. To recap:

- Before the first pyramid was completed at Giza, after circa 2527 BC, Jupiter had cleared the asteroid belt and again developed a coma and tail. "Re" was added to the pharaohs's names. The first six pharaohs of the following dynasty, the 5th (2490 to 2350 BC), built separate sun-temples dedicated to Re -- modeled on the mountainous lower plasma outpouring of Jupiter (the shape of which is called a Benben).
- Before 2349 BC Jupiter seems to have lost its coma tail, perhaps on entering the last outlying clump of asteroids. The Egyptian pharaohs lost interest in monuments to Re. This was followed in 2349 BC by an electric contact with Venus which brought the Earth to a larger orbit, near the existing orbit of the Moon. The *Chilam Balam* claims that Jupiter did not have its lower plasma form ("he was not crying"), when the Moon showed up. This suggests that the Moon showed up later than 2349 BC, although by the content of the *Enuma Elish* this could be questioned

[Image: a victory stele of Naram-Sin, the great grandson of Sargon. He is named after the Moon, Sin. Erected after 2250 BC. The two gods shown at the top as stars

are the Moon and Jupiter. Jupiter is shown on his mountain. Collection of Louvre Museum.]

- In 2349 BC the Absu fell, causing a period of extensive rains and storms on Earth (Noah's flood). The *Chilam Balam* places the "second baptism" (the "descent of water from the center of heaven") a hundred years later, but the text clearly deals with the fall of the Absu in 2349 BC. The date selected in the *Chilam Balam* was retrocalculated at a late date to match a unique Mesoamerican calendrical consideration: it had to fall on July 25th.
- The Palenque inscriptions of AD 700 claim that the three planets, Venus, Jupiter, and Mars were "born" in the newly cleared skies (corrected to 2337 BC), that is, they were clearly seen on the ecliptic, no longer obscured by the rings of the Absu. This is 10 years after the fall of the Absu.
- The plasma mountain of Jupiter returned very soon -- within three days -- after the fall of the Absu. The *Annals of Shu* claims that Jupiter, as Yao, took the throne in 2349 BC (corrected from 2357 BC). Yao will reign as supreme God (emperor of all the world) for another hundred years in China (it should be 199 years). One of Yao's first acts is to correct the calendar, since the length of the year had changed.
- The Palenque inscriptions record that the Moon crowns herself as ruler in 2305 BC, which should be corrected to 2282.6 BC. It is possible that the "crowning" does not mean anything. In the *Annals of Shu* Yao selects Shun, the Moon, to join him on the throne in 2287 BC.

Humans are now ruled by two large globes in the sky, Jupiter and the Moon, possibly of equal size. One is steady and slow, the other is forever busy on a survey of the land (as said in the *Annals of Shu*). The *Chilam Balam* reads, "the entire world was proclaimed by Uuc-yol-zip." Watching the daily changes in the movement of the Moon will convince anyone that the Moon spends considerable time above other parts of the land.

- The *Annals of Shu*, state that Yao dies after a long rule. The Chinese scholars of the second century AD estimate the date as 2257 BC, but it should probably be a hundred years later, in 2150 BC -- matching the death of Abraham. (It is uncertain as to what was actually seen.) Ussher places the Tower of Babel incident after 2247 BC. But it was Jupiter which went up in flames in 2150 BC and not Mercury. The *Chilam Balam* places the "fire on high" in the (corrected) double decade dates of 2167 to 2147 BC. The *Chilam Balam* also ties the event directly to Jupiter.
- There was an additional intersection of Earth's plasmasphere with the tail of the plasmasphere of Venus in 2193 BC, causing another Earth shock, a change in the orbit, and a loss of sunlight lasting 200 years. The Second Kingdom of Egypt collapses, as does the Akkadian Empire. The flaming of Jupiter in 2150 might not have been noticed at the latitude of Mesopotamia and Northern Egypt. It is suspected that the shading of Earth by nano-sized carbon particles in the stratosphere may have differing effects at different latitudes.

From the mix of these four records -- the *Annals of Shu*, the Bible chronology of Bishop Ussher, the inscriptions at Palenque, and the *Books of the Chilam Balam* -- it is clear that there is little agreement on when the Moon first showed near Earth, or when it was considered to be established on a regular orbit. There is closer agreement on a date for the fall of the Absu, although the *Chilam Balam* places the event much later, but on purpose. There is more agreement on the date of the last event, the "burning tower." This concludes a century busy with celestial events.

Different people interpreted the events differently, but all of them needed stories and histories to reflect what they had experienced and how things had changed. Most of the "legends" came forth in the years following 2200 BC, although some were further delayed by the 200-year drought which followed immediately.

... Egypt

The Egyptians remained faithful to the elder gods, although they no longer confused celestial apparitions with rulership of their lands as they had a thousand years earlier after 3147 BC. The pharaohs of the 5th and 6th dynasty institute a worship of Re, then seem to change it after 2349 BC (for Osiris), to be picked up again later. After Jupiter extinguishes two hundred years later, a new supreme God is added in Egypt, or rather, named. It is Amun-Ra -- "Hidden Ra" or "the hidden sun," as archeologists have it.

Amun-Ra is also spelled "Amen-Ra" and "Amon-Ra," and is also known simply as "Amun." Amun is almost universally identified with the Sun by archaeologists, even though there is not a single indication of this in all of Egyptian writings and inscriptions. The Moon is never seriously added as a God, although today the Moon is almost universally confused (by archaeologists) with Thoth, who is Mercury. In the Ptolemaic era (after 300 BC) the Moon seems to have taken over the identity of Thoth, although the Greeks of that period still equated Thoth with their Hermes. So do I. The Moon also goes by the name of Aphrodite ("foam born" according to Hesiod, meaning the foam of the sea), and is female. [\[note 18\]](#)

... Babylon

The priests of the city of Babylon, under the dynasty which might have included Hammurabi, and probably after 2100 BC (but possibly a lot later), wrote the *Enuma Elish*, a creation account which raises Marduk (Jupiter) to the status of chief God, by agreement (says the text) of the elder Gods of Akkad and Sumer. The text relates events which had been witnessed (but not recently) as proof of the change: the disappearance of Marduk's garment and its reappearance at his command, the battle with the dragon Tiamat (the plasmoid of Venus), the removal of the Absu (the net), the clearing of the skies in the south, the sighting of the southern stars, the delineation of the zodiac, the placement of the Moon, and the revision of the calendar.

For the Babylonians, and for the older land of Akkad and Sumer, to recognize Marduk as chief of the Gods resolved a crisis in faith, and gave proof that the large red globe in the south, previously standing on a mountain of plasma, along with the Moon which had now appeared, was there by destiny and in agreement with older traditions. Marduk became the most widely recognized God in Mesopotamia, from Assyria to Elam, and retained his status as chief God for two thousand years. Not a little of his status was due to the central political position assumed by Babylon after 2200 BC -- but also because he could be seen yet at that time in the skies.

Because it was probably written 500 years after 2349 BC, the text of the *Enuma Elish* is out of order, even though all the individual elements of the event of 2349 BC are included.

... Bible texts

In the Bible texts Jupiter has become Abraham, who receives a son, the Moon, only in old age, and then nearly sacrifices him on a burning mountain. Similarly to the *Annals of Shu*, Jupiter is held up as the model of good behavior. [\[note 19\]](#)

... Mayan texts

The *Chilam Balam* certainly is the most strangely different from the other texts mentioned above. Even though relating events from 4000 years earlier, it is also consistently the most accurate. It is mostly different in not having an obvious didactic agenda. We are presented instead almost solely with natural history, and a few complaints about the kings and leaders of the past. In the face of the new Christian religion, the *Chilam Balam* only seeks to prove that the older worship of "these stones" might simply have been a mistake.

"Very rightly they worshiped as true gods these precious stones."

"These stones" were volcanic concretions, noted in the *Popol Vuh*, which were held to be the spirit containers of the earlier Gods which had roamed the skies. One section of the *Chilam Balam* even equates the planetary Gods before "creation" as stones inhabited by the spirit of the Christian God.

... China

The Chinese would recall Yao and Shun as exemplary figures who instituted good government. Nothing is said of the burning of Jupiter. The Xia dynasty, which followed the reign of Yao and Shun (after 2205 BC), took control of the land and the people, and made it through the period of bad weather.

China turned secular, although it remained nominally monotheistic, but never again concerned itself with signs in the sky. All the subsequent rulers were "kings." The title of "emperor" -- a ruler over all the Earth -- was not used again in China for the next 2000 years.

The Moon Dies

In 2193 BC Venus made electric contact with Earth again, the last time in this era. As I noted in the previous chapter, both Akkad and the Old Kingdom of Egypt come to a close. There is very little else we hear from the Eastern Mediterranean region, or nearly anywhere else, about this event, except for the failure of agriculture.

We have only very slim chronological data which point to what actually happened. The contact by Venus was not accompanied by impressive celestial events, and nothing was recorded in legends and stories, unlike the earlier contact of 2349 BC. What I believe most likely happened in 2193 BC, is that Venus, in this instance being considerably closer to Earth, made a compressive contact to land, followed quickly by lightning strikes to land which resulted in large blazing forest fires which in turn lofted ashes and particulate matter into the stratosphere, blocking sunlight for the next 200 years.

The Earth's orbit again increased, to 270 or 280 days (I suspect 273 days). At the same time the Moon relocated further from Earth, taking 28 days to complete one rotation (month) around the Earth. The recorders of the Xia dynasty tell of the removal of the Moon (Shun) from nearer to Earth to higher up at the conclusion of his tasks, suggesting that he died.

"In the thirtieth year of his age, Shun was called to employment. Thirty years he was on the throne (with Yâo). Fifty years afterwards he went on high and died."

"Going on high" is not likely to be the sudden disappearance of the coma of the Moon, although this should be kept in mind as a possibility. The Moon may have had an atmosphere at an earlier time, before meeting up with Earth. But I do not think the Moon ever supported much of a coma, being a small rocky planet without a magnetic field, and having spent

perhaps millions of years at the same distance from the Sun. (The Moon is older than the Earth.)

If, in effect, the Moon became smaller, it would be because it moved further up into the sky. Adding the 30 plus 50 years to the date when Shun was called to employment, 2277 BC (corrected from 2287 BC), places the "going on high" of the Moon in 2197 BC. This is four years before 2193 BC, but, given the guesswork at chronology by the Han dynasty (and me), it is close enough to suggest that this can be linked to the fourth approach by Venus in this era.

The reason for suggesting a year of 270 or 280 days with ten months of 28 days, is that a ten-month year and a 28-day month start to show up in this era. The Shang dynasty of China (although after circa 1700 BC) records 28-day months and 27-day months. I suspect from this, that the year may have been at some value in between, and suggest it may have been 273 days (which also solves some problems with the Olmec calendar). Ten lunar months would likely have been in use.

We have little information on the ten-month year, except that even today some people count only ten months in the year, stretching the last month of each year to 90 days. Additionally, a few calendars kept counts of 10-month cycles, even when there were 12 lunar months in the year. In India the sky was mapped to 28 "lunar mansions" a concept still in use today. (For additional information see Appendix A, "Chronology.")

In the following years the southern stars were mapped, calendars were adjusted, commerce and trade were expanded, and histories were created. Politics changed and developed as they always had, but the relationships with the Gods remained stable.

The Return of the Axis Mundi

Since in 2349 BC the Earth increased its orbit, it would again have to equalize its charge to match the new orbital location. And do so again in 2193 BC. Again this would be accomplished through an influx of electrons at the magnetic poles. The plume of plasma in glow mode which had appeared directly after 3147 BC, would return, and probably at both poles.

After the battle with Tiamat, Marduk sets his bow (classically identified as "a rainbow") up in the heavens as a sign of triumph. The bow is the south polar plasma plume. It is a bow standing up, not hung horizontally across the sky from pegs like a rainbow.

[Image: Shamash (Jupiter) with his banded head wrap, seated on his temple seat and holding a "shen." The "shen" dates the iconography to after 2914 BC. The south polar plume rises above Jupiter (and thus the ecliptic), dating the image to after 2349 BC. A small figure at the end of the plume controls the rotation of the southern stars. The terminating ball or ring of the plume is here interpreted as a manikin. The end of the plume moved with the rotation of stars. The table and pillar likely are architectural details, like the God's seat, which latter reads "temple." The humans are identified and place this Babylonian cylinder seal in the 9th century BC. Collection of the British Museum.]

The Maya *Chilam Balam*, which lists the four trees which hold up the heavens in each instance after a recreation of the world (a change in the orbit), speaks directly to the tree of the south as part of the event of 2349 BC (the "flood of Noah," and the Maya "third creation").

"The planted timber was set up. Perishable things are assembled at that time. The timber of the grave-digger is set up at the crossroads, at the four resting places."

-- Ralph L Roys *The Book Of Chilam Balam Of Chumayel* (1933)

The text is not exactly lucid, but see the chapter "The Chilam Balam" where this is further explicated. The first "planted timber" may be the plasma plume at the north magnetic pole. The second one, set up at the "crossroads" is the plume of the south (viewed from north of the equator).

The "crossroads" is the intersection of the ecliptic and the equatorial, both of which were visible, and thus the equinox. The "perishable things" are the Pleiades, held to be celestial seed corn by the Maya. The "grave-digger," Roys notes, can also be understood as "hider," someone who hides objects. I would suggest this as applicable to the Absu. Note the phrase "at that time." A new condition is being described. From the further context of the *Chilam Balam*, it is, without a doubt, the event of 2349 BC.

It is further of some interest to recall that this event, the sudden appearance of a southern

plasma plume, is described in the *Popol Vuh* as the attempt by the Four Hundred Boys to impale the mountain giant Zipacna in a grave he has inadvertently dug to hold the center post to their house. Zipacna is Jupiter. He appeared in the depression of the Absu on about September 8th (two nights after the fall equinox). Once the Four Hundred Boys are thoroughly drunk, Zipacna enlarges himself and "blows up the house."

[Image: Egyptian: Flames of the four cardinal directions;
brazier glyph detail.]

The "house" shape of the Absu would result because the Earth's axis had initially bent away from the direction of the Sun when the shock was received from Venus. This should be remembered, it is integral to any recollection of the 3-day event. The image of the Absu would thus have been rounded again like a hut, with the Earth's shadow creating what looked like an arched doorway to this hut. On the third day, with the axis of the Earth sufficiently recovered from the application of the gyroscopic reaction torque, this imagery would have changed back to a gap -- as if the house had exploded. The Four Hundred Boys become the Pleiades, now seen among the stars directly above the gap of the exploded house and above Jupiter which is seen to rise from the gap also. See the chapter "The Popol Vuh." The rising or resurrection of Jupiter from a cleft in the Earth -- the old Absu at the time of the equinox -- reappears in Maya iconography, as Jupiter rising from a crack in a turtle carapace.

References to the polar plasma plumes show up also among the spells of the Egyptian *Book of the Dead*.

"Who then is it?"

*"Those above their braziers -- it is,
the image of the Eye of Re, together
with the image of the Eye of Horus."*

"Others say:

*It is the two mighty and great cobras
on the brow of thy father Atum."*

*"Others say:
It is his two eyes which are lacking in his head."*

*"Who then is he?
It is Horus with the Two Eyes."*

-- E. A. Budge, *The Egyptian Book of the Dead* (1895)

This describes the two ball plasmoids (as eyes), which existed at the ends of the polar plumes. Sycamore trees seem to have been used for the "plumes" of the east and west cardinal points, at times as dual trees. The guardians of the east and west, the Akeru, are depicted as lions (not only in Egypt, but also in Akkad). The implication of these texts is that the chief God of the Egyptians is absolutely gigantic in size; he spans all of the heavens.

"Lacking from his head," refers to Jupiter in his later form, when the "eyes," originally formed by the equatorial toroid are no longer visible at the much greater distance after leaving the asteroid belt.

The flaming braziers, with smoke which curves back to point down, are usually presented as four in number, but at times as six. There are also depictions of six braziers at the edges of a rectangular "lake of fire." This last, the lake of fire, remains as an obstacle to reaching the underworld throughout all of the Book of the Dead. There is no physical analog for the "lake of fire."

In Southern Mesopotamia depictions of the east and west plumes appear on cylinder seals as flags (vertical banners), mounted to poles which are bent back somewhat, with a circle at the top (called "ring-topped standards" by archaeologists). These forms appear regularly, and have also been called "doorposts" both in original Akkadian texts and by archaeologists.

On one cylinder seal the plumes are depicted adjacent (left and right) with a reed hut with rays emanating from its roof. They are "associated" with Inanna (Venus) in that the cuneiform symbol for "Inanna" has been added. The house is likely the Absu, so that in this case the "circle plumes" represent the plumes of the east and west cardinal directions.

[Image: Mesopotamian circle plumes, depicted on a vase.
After H. W. F. Saggs, "Babylonians" (2000).]

The Tower of Babel

An incident, and possibly this very incident, following about 200 years after the fall of the Absu, generated the initial version of the "Tower of Babel" stories throughout the world. The Tower of Babel story is interesting because it occurs everywhere in the world. A "Tower of Babel story" was told to the invading Spanish in Central America in AD 1500. It was known also among North American tribes. Around the world, the stories all have the same three elements: a burning (or collapsed) tower whose construction is attributed to humans, a confusion of languages or loss of memory, and the dispersal of peoples. It seems almost certain that the Tower of Babel event was the last spasm of Jupiter before diminishing to just a star-like pinpoint of light.

However, quite a few of the stories attribute the burning tower to the planet Mercury. This might be correct and I'll discuss this below, even though the incident involving Mercury happens 2000 years later. There are, however, only hints in mythology that it might have been Mercury. Surely the *Chilam Balam* would have had reference to Mercury, since the story is widespread. The *Chilam Balam* says nothing. It only reports that "the face of the sun" -- the midnight sun -- was "taken from earth." "The Sun" is Jupiter. The Maya or Olmecs would not have made a mistake in identifying this planet.

Ussher dates the Tower of Babel event to "after 2247 BC." According to Velikovsky, the medieval chronographer Abraham Rockenbach, in *De Cometis Tractatus Novus Methodicus* (1602), places it in 2060 BC, but attributes it to a comet seen over Egypt.

"In the year of the world one thousand nine hundred and forty-four [2060 BC], two hundred and eighty-eight [288] years after the Deluge, [which calculates to 2348 BC] a comet was seen in Egypt of the nature of Saturn, in the vicinity of Cairo, in the constellation of Capricorn, and within the space of sixty-five days it traversed three

signs in the sky. Confusions of languages and dispersals of peoples followed. On this the text of the eleventh chapter of Genesis speaks in more detail."

-- Abraham Rockenbach *De Cometis Tractatus Novus Methodicus*, in Velikovsky, unpublished documents, at www.varchive.org

The Tower might have been a comet, but it is not Jupiter. Jupiter does not traverse three zodiac signs in 65 days. The date of 1944 AM is based on starting a count in 4004 BC. The date 288 years earlier is the Deluge of 2349 BC or 2348 BC, the classical date of the flood of Noah. Both of these match Ussher's chronology.

Velikovsky, in a footnote to an unpublished document ("Mercury"), quotes from the *Bhagavatamrita* that "Buddha [Mercury] became visible the 1002nd year of the Cali yug." The Kali era (Cali yug) started in 3102 BC, as retrocalculated as a conjunction of planets. The 1002nd year is 2100 BC. This is likely the second showing of Mars and Mercury (to be detailed in a later chapter) in 1936 BC, which caused the destruction of Sodom and Gomorrah.

Rockenbach's date of 2060 BC does not match Ussher's estimate of "after 2247 BC" for the Tower of Babel incident, nor a Mesoamerican date for the "fire on high" which I have placed with some confidence in 2150 BC -- in Katun 8-Ahau (2.10.0.0.0) dated 2167 to 2147 BC (corrected dates). This last date, however, together with the Kali yug date, correspond to additional dates for the extinction of Jupiter: the mention by Gudea in a tablet or prism of the "brightness of Ningursu," dated to circa 2150 BC, and the historical notice in the *Annals of Shu* written during the Xia dynasty of a celestial event in about 2155 BC. Details of the mention in the *Annals of Shu* follow.

Of the four records of the Xia dynasty in China (2205 to 1767 BC) listed in the "The Books of the Hsia [Xia]" (of the *Annals of Shu*), there is one, the last, dated to 2155 BC, which mentions a "celestial phenomenon." We should ask why, from among the hundreds of eclipses which (may have) happened in China during this long period of history, only this single event, "a celestial phenomenon," was deemed noteworthy enough to record and transmit to the future. [\[note 20\]](#)

Although Mesoamerican and Chinese sources speak to a crisis of Jupiter, almost all sources on the "burning tower" speak of an incident involving the planet Mercury. In the Americas, at first contact with Europeans, stories of a "Tower of Babel" event were extant. Elsewhere, in Mesopotamia, Greece, and Egypt, there are dozens of documents in antiquity, plus additional tales and legends spanning four continents, which all relate the loss of memory or changes in languages to Mercury -- the Gods Hermes, Thoth, Nebo, Odin. In fact, the status of Mercury as an important God dates from remote antiquity (around 2100 by the estimate of de Grazia).

Velikovsky placed the event "after the flood which ends the age of Jupiter" -- by which he would likely mean the Noachian flood. In the late legends of Egypt, which recall the flood of

Noah as the bloodbath (and beer bath) of Hathor, when the God Ra abdicates he turns his duties over to Thoth. That would have been, as best I would guess, after 2150 BC. That date agrees with the first appearance of Mercury as a God to which attention needed to be paid -- in the 1002nd year of the Kali era, 2100 BC, and certainly coming close to Earth starting in 1936 BC. The "first appearance" is thus likely to be the coincidence with the flaming and extinction of Jupiter, when Jupiter's duties are turned over to another planetary God.

Let me point out the obvious: Velikovsky's choice of a date was influenced by Ussher's chronology. Ussher's pick of a date was in consideration of the Bible story of the Tower of Babel. The Bible in turn could not admit that Abraham had gone up in flames 199 years after the flood, or, for that matter, that Abraham was born two days after the flood of Noah, so that the Tower of Babel text as presented in the Bible ended up being based on a much later event: the real Tower of Babel event which is dated to 686 BC.

Why was the Tower of Babel story included in the Bible at all? Mainly because it was part of the sacred history of the world, of which the Hebrews were the recognized keepers. But, perhaps more importantly, everyone (at the time of the final composition of the Bible) knew it had happened: a tower to heaven was built, it caught on fire, and it burned. Other people and other tribes would hold the Jews accountable for an accurate history of the world, especially with their claim that only their God was the true God of all history. In antiquity the books of the Torah were used as valid sources about the past by a number of other nations.

Mercury

I will now turn to Mercury, and introduce some facets of this planet. Although only somewhat larger in diameter than the Moon, it has 4.5 times the mass. Mercury is half the mass of Mars. We know that Mars in 747 BC budged the Earth to a larger orbit and longer year, by 930 thousand miles (1500 thousand km) and 5.24 days. It is quite possible that Mercury, with half that mass, never "hit" the Earth with a repulsive electric shock serious enough to move Earth in its orbit. At least, we have no calendrical record. But it could have involved a change in eccentricity. This would change the kinetic energy of the Earth without changing the orbital period.

It seems certain, also, that Mercury overran the orbit of Earth since remote antiquity. That Mercury was seen on a wildly eccentric course is almost certain for several reasons. First of all, Mercury still has the most eccentric of all planetary orbits. Mercury is the one planet which nearly doubles its distance from the Sun over the course of its 88-day orbit. No other planet comes close to having such an eccentric orbit, and we could be assured that, if Mercury had been seen in both the northern and the southern skies 3000 years ago, when the orbit of Earth was still 30 percent less than it is today, Mercury would have regularly reached beyond the orbit of Earth. This corresponds to the fact that Mercury was assigned in antiquity, almost universally, the duty of messenger of the distant Gods Saturn and Jupiter -- the planets remaining on the ecliptic of the southern sky.

Secondly, the God Mercury had the "wings" and "snake tail" of the "caduceus" -- an indication that it moved on a highly elliptical path, behaving like a comet which loses and regains a surplus of electric charge with each turn around the Sun. The disk with wings and the extrusion at the end was a glow mode plasma discharge generated as Mercury traversed the electric field of the Sun. But, whereas Venus sported an immense tail (30 million miles, 48 million km, today in dark mode discharge), Mercury, which is much smaller (only 40 percent larger in diameter than the Earth's Moon), would most likely have had a relatively short plasma tail but with wings as the north and south plasma plumes at the poles (which, by the way, were seen sideways as Mercury passed close to Earth: one above, one below).

The "disk" of the caduceus is likely to be its spherical coma, which could be supported by Mercury since it had a substantial atmosphere (it still has a remnant atmosphere today). Mercury has only a very weak magnetic field, but apparently it was enough in the past to allow the part of its plasmasphere facing the Sun to light up in glow mode. It looked like a musical instrument, and music is attributed to Mercury. It also looked like a bow strung with an arrow. Mercury was identified by the Greeks as Apollo, "the archer God who shoots from afar." The name Apollo was transferred to the Sun after Classical times. [\[note 21\]](#)

And lastly, again, we have the many descriptions from antiquity that Mercury was the messenger of the Gods -- swinging from aphelion beyond Earth's orbit to perihelion with the Sun after passing by Earth. If Mercury were on an orbit which reached from the Sun to a location beyond the Earth, it would look as if he were visiting the departed Gods in the far reaches of space. It would have been logical to assign Mercury the role of messenger. As such, Mercury was charged with the task of caretaker of mankind.

As I will suggest in the chapter "Exodus," when it was certain that all the Gods had left, Mercury as the caretaker God was acknowledged as the intermediary between the distant Gods and mankind, a God who was charged with all the arcana of magic, special materials, writing, and language. That God was the Egyptian Thoth, Sumerian Enlil, Greek Hermes (originally Apollo), Roman Mercury, and the Norse Odin -- each of which can be identified with the planet Mercury.

In Roman times, some Northern European tribes declare Odin as their primary God. That is really strange if Mercury had always behaved as today -- only seen infrequently for a few minutes per night above the east or west horizon near the rising or setting Sun. Mercury was the last planetary God, except for Mars and Venus, who still visited long after the other Gods had retreated. But, unlike Venus, he seemed immensely busy, crossing Earth's orbit every year and a half. But when Mars was still active in coming close to Earth, the destructions by Mars (especially in the Eastern Mediterranean) completely eclipsed notice of Mercury when both showed at the same time.

The Burning Tower

Since there are universal memories of the Tower of Babel event, it was either an absolutely stupendous event, or a recent event. The blood in the sky and the fall of the Absu in 2349 BC was a stupendous event and was universally remembered for 4300 years. The Tower of Babel, if assigned to Mercury, could not have been at all remarkable by comparison. I would therefore suggest instead that the event was recent and, in fact, much more recent than Ussher's estimate of "after 2247 BC" -- it happened on March 23, 686 BC. The basis for this date will be developed in a later chapter.

In identifying a plasmasphere contact in 686 BC, I am continuing my claim that every catastrophic event of the past should be able to be clearly identified, graphically visualized, mechanically reconstructed, dated, and located by a consideration of orbital parameters. This is not to say that tales, stories, and myths were not recycled, so that the extinction of Jupiter in 2150 BC became a foretelling of the event of 686 BC, and the fire on Mercury in 686 BC provided the details for the Bible's description of a similar event 2000 years earlier.

Where does the "burning tower" enter into the picture? It was likely a plasma discharge between Earth and Mercury. I would assume that, after the plasmaspheres touched, and a shock was exchanged, a charge imbalance between the planets induced a stream of plasma in glow mode to reach from the ionosphere of Earth to the cloud cover or surface of Mercury -- in effect a lightning strike. (The southwestern prairies of the US burned up directly after the shock.)

The shock between Earth and Mercury happened as Mercury passed in front of Earth between Earth and the Sun. The distance between the planets was likely equal to the distance between Earth and the current aphelion of the orbit of Mercury. That represents a distance of 48,000,000 miles (77,000,000 km). That is the location that Mercury returns to today with each orbit around the Sun.

There would have been physical effects, an Earth shock and earthquakes and fire falling from heaven, but not nearly to the extremes of what was experienced when Venus made electric contact in 2349 or 1492 BC. Since the mass of the Earth is 20 times the mass of Mercury, it is unlikely that the Earth's orbit would be significantly affected. And, in fact, we have no record of a change in the length of the year.

Mercury, however, would likely have received a shock which might have thrust it far away from Earth. The shock location of 686 BC on Mercury can be identified; it has been known since the first spacecraft flyby in 1970. The contact location on the Earth is on the North American continent. The chapter "Destruction by Mars" will pinpoint the contact location.

The plasma charge exchange would have been limited because Earth had been in its present location from the Sun for a thousand years, except for the minor change in orbit of 747 BC. Mercury similarly had moved on a course from near the Sun to the asteroid belt for nearly 3000 years. In the case of Mercury, its charge would have been normalized to a value close to what was held by the Earth, since Earth was located about halfway along the elongated orbit

of Mercury.

The plasma contact (exchange of charge) might have involved arc mode exchange, but Mercury would quickly have distanced from Earth and the plasma exchange would have switched to glow mode. At that stage it probably would have assumed the shape of a steep triangular mountain -- similar to the pyramid-shaped "mountain" of plasma between Earth and Mars at the time of Horus after 3100 BC -- but at this time the mountain was understood as a man-made tower that could be seen as being constructed over a period of time (perhaps only a day or so) as it extended upward.

The tower would eventually have reached to the aphelion location of Mercury's orbit, 48 million miles (77 million km) from Earth. The tower could be seen to grow from Earth as the plasma stream changed from dark mode near Earth to glow mode further away. Possibly the "tower" was constructed in the reverse direction (that is, constructed from Mercury to Earth). The stream of plasma would increase in density on approaching Mercury -- an increase in electric current -- so that the mode changed to arc mode on reaching the surface of Mercury. There was the start of the fire.

During the earlier visits of Horus, no man-made pyramids or ziggurats had been built yet, and the very similar phenomenon at that time was described as the mountain built by the god Horus -- "who rises on *his* mountain." But towers or pyramids and ziggurats had already been erected by the time of the approach of Mercury and the idea that this was a tower constructed by humans was well within the imagination of those who were watching. In Mesopotamia the destruction of the tower had precedent in ziggurats which had been destroyed by massive lightning strikes.

The tower burned and collapsed. The tenuous atmosphere of Mercury still holds vast amounts of hydrogen and helium, as well as oxygen and sodium (which, because of its small size, would not be the case if Mercury were billions of years old). Hydrogen gases might have burned when the plasma stream connection from Earth turned to arc mode at the strike points on Mercury. The burning might have extended long past the time of the initial plasma contact.

The burning tower legends worldwide hold that people everywhere lost their memory or changed their language or both. The ubiquity of this detail suggests that it was fact. If we take this universal story at face value, it would suggest short-term amnesia, perhaps due to some sort of electro-shock, induced by the sudden change in the electric potential of the Earth's surface. Perhaps the plasma contact with Mercury fried our brains.

Mercury also is the only planet with a (slight) magnetic field to have made a close approach with Earth (even though its magnetic field is weak, and should not exist at all). This fact may explain why this incident was physiologically different from earlier and later approaches and plasma contacts with Venus and Mars, neither of which have a magnetic field. The effect of an imposed planetary magnetic field will not be felt, because planetary magnetic fields are

weak. But the flow of electricity toward the Earth's crust creates a magnetic field also.

The electric contact with Mercury was (possibly) at a closer distance to Earth than any of the half dozen contacts by other planets, with the exception of Mars. Mars completely entered the Earth's plasmasphere, and came so close that the devastating effects were local, extending perhaps only a few hundred miles north and south of its path. Mercury's contact, by comparison was global.

It is perhaps also likely, however, that during the plasma contact with Mercury, a time-varying electric or magnetic field was experienced. A varying magnetic field is known to have physiological effects. (See the endnotes to the chapter "The Start of Time.") This would also suggest another possibility for the "loss of memory" or "loss of speech." The plasma contact with Earth may not have been an event which took away memory, but which instead caused speech and memory to falter, thus bringing these to awareness in people worldwide. Perhaps this also brought an awareness that other people speak differently. [\[note 22\]](#)

The experience with the failure of speech may have forced people to write down their stories which previously had been passed along by word of mouth. The stories could thus be rendered correctly with future retellings. They might have also become aware that "old stories" could be "placed" in an imagined "earlier time." With books of recounted stories we immediately jump to the matter of primacy -- there are earlier and later events. That forces a new consideration of historical time.

It is also interesting to consider that shortly after the event of March 23, 686 BC, the output of the Sun changed radically after June of 685 BC. Within two or three generations after 685 BC we start to see the first attempts -- worldwide -- of a separation from a mythological past. This happens in physics, in philosophy, and in religions.

The dispersal of people in the Tower of Babel stories may or may not have happened. A few stories (as with some from North American Indians) do not include the details of a dispersal. It may have been that, instead of a dispersal, people were suddenly able, for the first time, to imagine the whereabouts of others.

The dates of 2060 BC or 2247 BC for the Tower of Babel event are incorrect. The date of 2150 BC represents the extinction of Jupiter, and became only a pre-telling of the Mercury event of 686 BC.

The First Histories

The suggestion made above follows from consideration of the onset of the development of subjective consciousness, nominally placed in circa 2000 BC or 1500 BC.

It is from Egyptian, Mesopotamian, Indian, and early Greek and Roman sources that we can

extract the most details about the celestial dramas and the corresponding human activities. Egyptian sources are primarily from tombs, since texts on papyrus have not lasted (although we have some papyrus texts dating back to 2400 BC). Egyptian sources have a continuity over more than 3000 years -- a continuity unequaled anywhere else. This is so because Egypt was the least affected by the worldwide floods which accompanied the three major catastrophes, and its land has retained productivity in the face of permanent climatic changes elsewhere.

Mesopotamian texts were inscribed on clay tables, more stable than papyrus (or bamboo slivers, as in China) and even more permanent when inadvertently fired to baked clay due to the burning of a palace or town. The clay tablets date back to 2700 BC and earlier.

The remaining sources elsewhere are textual recollections made after 700 to 500 BC from earlier verbal retellings. Indian sources are plentiful but are poetic representations of past events, recorded for their exemplary religious value and not transcribed to texts until very late. For China almost identical conditions are true. Greek and Roman sources also date exclusively from the period after 650 BC.

Inca sources in South America are silent. There is some evidence suggesting that literature may have been suppressed before the arrival of the Spanish.

Mesoamerican sources at one time graphically recounted the complete history of the world dating back 40 thousand years, including the birth of the Gods and their abandonment of Earth, but the records are clouded by a displacement of thousands of years, awaiting the invention of a script by the Olmecs and its full development by the Maya. The texts are now lost, destroyed by the Spanish invaders. Only recopied snippets survive. Yet the *Popol Vuh*, written circa AD 1500 in Central America, and thus 13,000 years after the "first creation," frequently recounts events with an unrivaled clarity.

For the rest of the world, however, many of the specifics of the genesis of the Gods and their abandonment of Earth are forgotten and today, thousands of years after the Gods left, we are presented with a confused set of oral histories offered as creation myths and tales of the stupendous deeds of forebears from hundreds of separate and isolated societies throughout the world. The actors in these dramas are varied, and the actions seldom make sense and offer no lessons, but they all involve the same themes, and the consensus in the remaining details, even after the passage of thousands of years, is astounding.

Almost everywhere the legends and records of the past date from after the fall of the Absu (2349 BC), and after the extinction of Jupiter (2150 BC). It may have been the loss of these last images of the "Era of the Gods" which created the impetus to start an historic literature. These events fall at a watershed in historical consciousness for it is followed soon by a profusion in the composition of legends and records everywhere. At least, this is true of Mesopotamia, but also of India and China.

In Egypt, vernacular narratives about previous earth-shaking events appeared much later. These narratives only show up in texts on tomb walls during the New Kingdom (1327 BC through 1136 BC), rendered as fashionably "old," that is, in the style of the Middle Kingdom, 2000 to 1500 BC -- the period following the events of the fall of the Absu. They are stories of previous destructions of mankind, not unlike the epics being written in Sumer, but unlike any text ever created in Egypt up to that time.

The composition of the earliest Hindu scripture, the Rig-Veda, can be placed before 1900 BC from geographic references to a location in Northwestern India adjacent to the Sarasvati river, which is said to have dried up over a period of 300 years after 2200 BC. The Sarasvati is held as the center of civilization in the Rig-Veda, although it may have been a mythological river.

The records of China were collated circa 550 BC as the *Annals of Shu*, transcribed from older sources. Only the first two sections of the *Annals of Shu* are recollections, dating back to 2357 BC. All the remaining sections of the *Annals of Shu* were written contemporaneously with the events they describe, and all these date to after 2200 BC. The first record is "The Speech at Kan" which can be dated to the period of 2188 to 2160 BC.

The script of Sumer, which had been used only for the most mundane record-keeping for 5000 years, was suddenly, after 2200 BC, used to record older extant stories like the *Epic of Gilgamesh*, to compose in Akkad (almost out of thin air) the *Enuma Elish* creation myth, and to write lengthy declaratory texts like the Code of Hammurabi (circa 1700 BC, in revised chronology). Although the texts of the narratives are often attributed to much earlier times because of their contents, they all date from within a few hundred years of 2200 BC to 2000 BC.

With the composition, in about 1750 BC, of the Babylonian *Enuma Elish*, Jupiter became the first conceptual -- philosophical -- God. Except, of course, that he could still be seen, and remained the brightest star-like object in the sky. This is still so today. [\[note 23\]](#)

The Return of Mars

The Early Bronze Age is a generic name for the period of about circa 2000 years BC, but the date varies from one region to another because the "Early Bronze Age" depends on what people were manufacturing. For our purposes, we can take it to mean approximately 2000 BC to 1800 BC, for the region of the Middle East which includes Canaan, Anatolia, Syria, and Mesopotamia. Dates this far back are not well established.

My interest in this period stems from the suspicion that perhaps Mars had again cruised close to Earth and caused extensive destruction, like it had between 3067 BC and circa 2750 BC. This is, in fact, testified to, and not only in the Middle East, but apparently worldwide.

"... almost every one of the flourishing Palestinian cities was destroyed at the end of the Early Bronze III period. The succeeding era, Middle Bronze Age I, ... was characterized by a non-urban pastoral society."

-- Damien Mackey, in "The Old Kingdom From Abraham to Hezekiah, A historical and stratigraphical revision" (2002) http://www.specialtyinterests.net/old_kingdom.html

Damien Mackey is here pointing up information originally compiled by Claude Schaeffer in *Stratigraphie comparée et chronologie de l'Asie occidentale* (1948), a source mentioned earlier.

After mentioning 2400 to 2300 BC, Schaeffer records a date of 1700 BC when many urban centers in the Middle East were destroyed. The date of 1700 BC is one from his series of dates which cannot easily be moved to a later period by imposing our knowledge of the fictional Greek "Dark Ages."

To be included in Schaeffer's compilation the disturbing elements had to include earthquakes and firestorms. This would signify close contacts with Mars -- very close. This had been the case for a period of 300 years some 1100 years earlier starting in about 3070 BC. This would happen again for a period of (only) 120 years, some 1100 years later, starting in 806 BC during the time of the prophets of Israel (detailed in a later chapter).

Schaeffer's dates have been summarized, expanded upon, and corrected by a number of people. I will give examples, starting with Geoffrey Gammon, writing in "Bronze Age Destructions in the Near East" (*SIS Review*, 1980).

Gammon notes that for Ugarit, the first incident of destruction is dated to 2300 BC. Schaeffer claims for this, and many subsequent destructions, that earthquakes were at cause, despite the fact that earthquakes do not extend (as he even notes) over distances of 600 miles (1000 km) with equally destructive results. They do not extend even 100 miles. Gammon points out fire, too:

*"As Alfred de Grazia has argued in a highly original and challenging article published in **Kronos** a few years ago, the severity of the conflagration which destroyed Troy II, to which the thickness of the layer of calcined debris or burnt ash 15 to 20 feet thick [5 to 7 meters] bore eloquent witness, indicated that whatever natural disaster overwhelmed the city must have been of massive, even catastrophic, proportions."*

Gammon here references Alfred de Grazia in "Paleo-Calcinology: Destruction by Fire in Prehistoric and Ancient Times", *Kronos* I:4 and II:1 (1976). De Grazia has detailed this also in *The Burning of Troy* (1984).

De Grazia notes that the evidence of fire..

"... has sometimes, with less than complete evidence, been interpreted as the work of torch-bearing invaders. For example, James Melaart uses the convenient phrase 'whether by accident or by enemy action' to describe the destructive combustion of Troy IIg. Earthquakes, too, are invoked with some frequency, although a determination that a fire is an effect of an earthquake is by no means simple."

Another who has expanded on Schaeffer's original data is Moe Mandelkehr, writing in "An Integrated Model for an Earthwide Event at 2300 BC" (SIS Review 1983), and three additional articles to 1999. Mandelkehr's first article is completely shrouded in caveats, one of which reads as:

"... there is no intent on my part to argue that all site destructions or cultural changes took place simultaneously at 2300 BC, or at any other specific point in time around 2300 BC. Even under conditions of wide area crustal stresses, earthquakes still occur fairly locally so that site destructions would be expected to be spread in time."

This last quote would have been added by anyone who considered the destructive Earth shock of 2349 BC, or would have been added as a warning to any other collection of similar data. Any sensible person would do this, and of course it would be phrased exactly as presented above -- that earthquakes might be many, but *certainly* would be expected to be distributed over time.

But that is completely wrong in this instance. In 2349 BC, the destruction everywhere was simultaneous.

The Earth shock of 2349 BC, which I have already presented, was so outstandingly frightful and impressive, that it was recorded in nearly identical "legends" worldwide, and long afterward, so that in AD 600 the Irish still weave it into their history of St Patrick, and the medieval epic poem *Beowulf* recounts the timing of the event with precision. The shock of 2349 BC and the following shock of 2193 BC were singular and instantaneous over a very large area, encompassing perhaps as much as half the circumference of the Earth. The initial shocks would have toppled cities and citadels, and would have been followed with lesser aftershocks for some time.

This was followed some 250 years later with additional nearly instantaneous events, probably at intervals of decades. These resulted from destructive sweeps of Mars close to Earth between 1936 BC and sometime in 1700 BC. (These dates will be developed below.) These were also nearly instantaneous over very large spans of territory. The cities where Mars passed close by -- perhaps a few hundred miles north or south of its path -- were given only minutes notice. Mars passed the Earth's surface at the speed of rotation of the Earth, which would be about 500 miles per hour (800 km per hour) at a mid-latitude. Along the path underneath Mars there would have been a gigantic moving fire storm, spreading flames left and right (north and south), which incinerated everything, even melting the very surface of the Earth, and sucked the burning material up into a hurricane-sized tornado. The agent of the

fire most likely consisted of ionized and electrified blazing dust from the surface of Mars.

The traveling electric arc of the tornado would have paused on high places, which is where citadels had been built. The pause would be caused by the fact that the next location after an elevated spot would represent a longer electric conduction path for the arc. In pausing the arc might have extinguished locally, to start up again further along. Where it stopped and extinguished, the suspended debris of burnt material and soil would dump. In the case of Troy, at a later date, this reached a depth of 15 feet (5 meters). To assign such fire evidence to marauding aliens is sheer lunacy.

What is instructive about Mandelkehr's articles is that he assigns the destruction primarily to fires. However, he relentlessly dates all of his destruction to 2300 BC. I'm certain that this is incorrect. It confuses the event of 2349 BC with other and later disturbances. I have discussed Mandelkehr's book *The 2300 BC Event* earlier in this chapter. [\[note 24\]](#)

Sodom and Gomorrah

Let me now introduce Sodom and Gomorrah with a quotation from E.J. Sweeney, "Abraham in Egypt" in *SIS Workshop* (1986):

"Genesis informs us that shortly after Abraham's expulsion from Egypt, the world witnessed a terrifying natural catastrophe. Fire and brimstone, it was said, fell on the Earth and consumed large areas of land in a general conflagration. The cities of Sodom and Gomorrah were obliterated from the face of the Earth; not one stone of them was left on top of another. Genesis imaginatively portrays the catastrophe as a punishment from God on the immoral inhabitants of these cities."

It was as bad as it sounds. Five cities were completely obliterated. There are only scant traces left today. These include an extensive cemetery of 500,000 graves at what is assumed to be Sodom, and others elsewhere. Archaeology has determined destruction by earthquake in 2350 BC, followed by a destruction by fire in circa 1700 BC.

"Paleoethnobotanists found in Bab'edh-Dhra [Sodom] traces of wheat, barley, dates, plums, peaches, grapes, figs, pistachio nuts, almonds, olives, pine nuts, lentils, chick peas, pumpkin, flax seed, and watermelon. It was a gourmand's delight. The healthy diet manifested itself in the physique of the inhabitants: skeletal remains indicate that a height of 5'9"-6'4" was quite normal."

"The date of the destruction of Sodom and Gomorrah according to Biblical chronology was a year before the birth of Isaac, which was in 1712 B.C.E."

-- Biblical Archeology (on line), www.aish.com/ci/sam/48931527.html

Other causes have been voiced, of course. A press release of the Cambridge Conference (a

SIS event), headlined the following on March 30, 1997:

"Comet Destroyed Sodom And Gomorrah"

"Sodom and Gomorrah may have been destroyed by debris from a comet, startling new archaeological and astronomical research suggests."

The article places all the destructions in 2200 BC, 150 years after the earth shock (and "day of the dead") of 2349 BC, and 250 years before the more likely date of circa 1936 BC (by my calculation, shown below). The press release was prepared by Benny Peiser, who is given to cometary causes, and who added (<http://abob.libs.uga.edu/bobk/ccc/cccmnu.html>):

"Previous explanations, like a massive earthquake or volcanic eruption, could not account for destruction over such a vast area. The meteorites would have exploded above the ground with the power of scores of nuclear bombs: one devastated a vast area of Siberia in 1908."

Peiser is here extending the explosive effects to the catastrophic ending of the Egyptian Old Kingdom, the failure of the Akkadian Empire, the demise of the Harappan civilization, and the end of the Xia Dynasty of China. Victor Clube of the Clube and Napier team who wrote the unlikely *Cosmic Serpent* (1982) joined the bandwagon and announced that (quoting the press release) "He [Benny] has calculated that the Earth passed through a cloud of debris -- the Taurid meteorite stream -- thought to have resulted from the break-up of a comet 40,000 years ago, between 2200 BC and 2000 BC." I don't know where they get these dates, always conveniently placed at one catastrophe or another. The meaning here is that Earth passed through debris in 2200 or 2000 BC. of a meteor which broke up in 40,000 BC.

I doubt almost all of this. But an earthquake which destroyed the five "cities of the plain" in 2350 BC is certain. A BBC story, "The Destruction of Sodom and Gomorrah" (February 17, 2011), reported an estimate of 6 on the Richter scale. That is sufficient to topple a city of mud-brick buildings. The epicenter, we know, was in Tibet. The second destruction is certain also -- the evidence is in plain sight -- but it came 400 years later, in 1936 BC. This consisted of a fire which reduced the stones and walls to a powder.

Now for a determination of the most likely date. Adding the known starting date of 3067 BC for the earlier close passes of Mars, to the start of close passes in the 8th and 7th century BC, 806 BC, and dividing by two, results in a starting date of 1936 BC as a most likely start of a set of "contacts" by Mars at the close of the Early Bronze Age which resulted in the destruction of Sodom and Gomorrah. In an article in *Aeon*, Donald Patten writes that Talmudic source materials pinpoint the destruction to the day of Passover. [\[note 25\]](#)

The Return of Mercury

Standard Bible chronology places the destruction of Sodom and Gomorrah at one year before the birth of Isaac in 1712 BC. But this is likely to be incorrect since all of it is tied to the lifespan of Abraham, who is Jupiter, and who is badly misplaced in time for the sake of a coherent timetable which places Abraham after Noah, rather than before. I have detailed all this earlier.

We should look instead at other sources. First, it has been noted by others that the local name for the planet Mercury, which (I claim) was a constant companion to Mars, became a faddish personal name after about 2200 BC. De Grazia notes that Mercury "was assigned a period of heavy worship between 2200 and 1500 BC." He writes, in *The Disastrous Love Affair of Moon and Mars* (1984):

"M. Mandelkehr has more recently informed me of several additional authoritative sources who found Thoth [which is Mercury] active throughout the Old Kingdom of Egypt, and points out that his ibis symbol existed even before dynastic times." [\[note 26\]](#)

It should also be pointed out that there is a progression of latitudes where Mars passes by Earth. I had supposed that the first set of close passes by Mars may have happened above the Earth, or at least away from Earth. Manetho, however, identifies some catastrophes in Egypt after 3067 BC, the first period of close approaches by Mars

The second contact involves the destruction of Sodom and Gomorrah. Schaeffer, on the other hand, identifies sites of destruction for this second time period at about 40 degrees latitude.

The third set of passes by Mars, to be discussed in a following chapter, happened at 35 degrees north latitude.

Last, the Bible story of Sodom and Gomorrah is not easy to read and is easy to misread. Two angels visit Lot, reads the King James bible, but the Hebrew bible calls them kings. The very fact that there are two angels makes me suspect that they represent the twin planets Mars and Mercury. Too bad that descriptions are missing, unlike for Esau and Jacob. Jacob is smooth, Esau is red and hairy. What we do have is the stated fact that the angels blinded the Sodomites before destroying their city. This might be the magical abilities of angels, but I am more inclined to understand this as a celestial explosion, an explosion not unlike the blast at Tunguska.

The birth of Esau and Jacob is also most likely the reappearance of Mars and Mercury in time for the destruction of Sodom and Gomorrah, at their birth date or a decade and a half later. Esau and Jacob are sons of Isaac, who is the son of Abraham. Estimates of the destruction of Sodom and Gomorrah in about 1700 BC are thus probably about correct (my starting date is 1936 BC).

Also not to be neglected is the curious condition of Lot sitting at the gate to the city when he encounters the two angels. Although this tale of Sodom and Gomorrah is 400 years after the

fall of the Absu, here again we encounter a doorway to another place. It is the doorway of the Absu. If it can be told that Samson could tear out the city gates of Gaza 700 years later, and carry them off, then certainly the tale of Lot sitting at the city gates should be allowed at the same mythological level of retelling. Bible commentators, since antiquity, have attempted to make much of Lot sitting at the gate, assigning Lot the mayorship of Sodom, with the task of greeting all visitors. Similarly much is made of the licentiousness of the inhabitants.

It would seem that something ought to be made of the fact that the orbit of the Earth was different in each of these three cases -- 3067 BC, 1936 BC, and 806 BC. But the circular geometry has little effect on the interactions between the planetary orbits. It will change the calendar dates of the interference slightly, and it might affect how close Mars came. Only the rotation of the second nodal points of the two orbits would in each instance have brought the interactions to a halt to be repeated 1150 years later -- excepting the last time, as I will show, which ended in an accident for Mercury.

Special thanks to J Brookes for questioning the red look of Sirius.

Special thanks to J West for interpretation of Sodom and Gomorrah.

Endnotes

Note 1 --

The reaction of the spin axis of the Earth to a torque applied off-center to the equator is discussed in Appendix B, "Celestial Mechanics" and illustrated with diagrams.

A better estimate of the travel time of the plasmoid from Venus would be based on a speed of 6 million miles per hour (9.5 million km per hr). This is detailed in the text.

[\[return to text\]](#)

Note 2 --

There is a 1000-year gap between the event of 2349 BC and its retelling in 1350 BC and after. But the appearance of Hathor as the Celestial Cow had happened again in 1492 BC and 1440 BC. The name of Marduk, the chief god of the Babylonian empire, is spelled in the Akkadian language with the Sumerian glyphs "AMAR.UTU" which reads "calf of the Sun."

[\[return to text\]](#)

Note 3 --

I am using the translation to English by Suzanne D. Fisher from the Spanish original made by Bolio in 1930. This text, along with a later translation of the Mayan original to English made in 1933 by Ralph Roys, is discussed in the chapter "The Chilam Balam." In this instance the text by Bolio makes a little more sense of the original than the more secular interpretation by Roys.

[\[return to text\]](#)

Note 4 --

The words "and" and "then" of the phrase "and then days of the year were introduced" are both from the same base Mayan word, and do not imply the time-order of words as in Indo-European languages, where "then" means "after" and "and" implies simultaneous. I hope this will hint at why quotations from the *Chilam Balam* are to be taken in with some caution, and why the translations are often so choppy.

[\[return to text\]](#)

Note 5 --

Warfare weapons in Mesoamerica included spears, halberds, and dart throwers, not arrows. Only game animals were hunted with arrows. This war, however, is described as using arrows.

[\[return to text\]](#)

Note 6 --

If the plasmoids from Venus traveled at 6 million miles per hour, Venus would have been within a distance of over 20 million miles (32 million km) from Earth in order for the arrival of the first plasmoid to have been delayed 6 hours. The travel delay to Jupiter, at 6 million miles per hour would be $(4.5-1)*\text{AU}/(6000000*24) = 2.26 \text{ days}$. The switch to glow mode by Jupiter would have been seen on Earth about 30 minutes later -- **2.28 days**.

Although it is not at all certain how long "a day" was reckoned to be (most days during this period still started at sunset), the time delay could be counted as twice from midday to midday, plus 12 hours to midnight. At some locations the celebration of the "Day of the Dead" uses full daylight days and an evening, although in other locations it starts with a nightfall event.

The distance of 20 million miles may be an overstatement. If the eccentricities found by Lynn Rose and Raymond Vaughan for Venus and Earth for the 7th century BC, 0.15 and 0.10, can be applied to the era before 2349 BC, the difference between the perihelion of Venus and the aphelion of Earth is 17.5 million miles (28 million km) under the assumption that both orbits were 0.75 AU before 2349 BC;

$0.75 * (1-0.10) = 0.825 \text{ AU}$, and

$0.75 * (1-0.15) = 0.6375 \text{ AU}$, thus

$(0.825 - 0.6375) * \text{AU} = 17,437,500 \text{ miles}$.

[\[return to text\]](#)

Note 7 --

I cannot agree with the circumpolar rings, for a number of reasons. First, a circumpolar ring of dust or ionized gases would be electrically unstable. Mandelkehr assumes that these would be ice particles, following the "snowball" notion of comet composition.

Second, there is the standing problem of needing to radically change the speed and direction of material (whether meteors, asteroids, or fragmented "icy comets") coming in from outside planet Earth in order to be "captured." In all of recorded history, while millions of meteor-like objects are intercepted by the Earth each year, not a single object has ever been "captured." The Moon was not captured; it is a planet sharing Earth's orbit. It would be more correct to say that the Moon captured the Earth.

Third, Mandelkehr suggests that the rings would only have lasted some months. I have no opinion on that. What strikes me as strange, however, is his compilation of some 450 gods and their attributes, gathered from mythological sources from around the world. All of them, even sets of a half dozen from a single culture, are "associated" (to use his phrasing) with rings, circles, fires, horns, bows, mountains, and streams and serpents surrounding the Earth. I find most of this severely decontextualized from the mythologies I am familiar with, and I would suggest that it is very unlikely for 450 gods and goddesses to align themselves with

the iconography of a celestial phenomenon which lasted only a few months.

Fourth, although Mandelkehr's rings are nominally circumpolar, he places them at an angle of about 70 degrees to the equator, so that they pass between Ursa Major and Ursa Minor (as seen from Earth) near the Earth's North Pole. This conclusion was apparently reached on the basis of frequent references to Ursa Major in antiquity. But this location, between these two constellations, happens to be the location of the Earth's rotational axis if this is retrocalculated on the basis of today's conditions -- using the "precession of the polar axis" -- to 2300 BC. This condition would not define a set of rings at an angle of 70 degrees to the Earth's equator, but a set of rings at an exact circumpolar position, at right angles to the equator. This seems like an oversight.

The "rings" were seen and noted by the people of antiquity. But the rings had always been there, not circumpolar, but below the Earth's equatorial in the south sky. After 2349 BC, this was reduced to a single ring at a great distance from Earth but still below the equatorial in the sky -- which seems to have lasted to AD 400 or 600.

Note 8 --

Alfred de Grazia made note of the ubiquity of the Pleiades in mythology in *Chaos and Creation* (1984), writing:

"Many places around the world mark the beginning of November as the Day of the Dead; it is All Saints Day; Halloween; All Souls Day; etc. The time is associated with the Pleiades for reasons not clearly understood yet. The coincidences of time, mood, ceremony, and stellar assignation is so great as to exclude independent invention except in particulars and to insist upon a common experience of explicit quality."

De Grazia follows this by some comments on the possibility of diffusion, but diffusion is negated by the existence of a "Day of the Dead" festival in Mesoamerica before the invasion of the Spanish. De Grazia could not date or place the event.

[\[return to text\]](#)

Note 9 --

In addition to the invariant skies before 685 BC (actually, the lack of a precession of the equinoxes before 747 BC), I will develop in a later chapter that the equinox moved 15 days forward in 685 BC. Thus the equinoxes happened earlier. This is born out with data from the horizon setting angles of the Sun for Mesoamerican ceremonial centers, where 6 alignments out of 13 that were checked, point to an equivalent Gregorian calendar date of September 8th, two days after the earlier autumnal equinox date of September 6. See the chapter "Olmec Alignments."

The Pleiades were seen directly above Jupiter, because they are located about 6 degrees in elevation above Jupiter (which is on the ecliptic). Even if the coma of Jupiter was as large as Plutarch suggested in AD 200, "three times the diameter of the Moon" (and thus about 1.5 degrees in diameter), this would not have obscured stars located 6 degrees above the ecliptic. By the following year the Pleiades were used as the marker to celebrate the event. Jupiter would not return to this location against the background of stars for 9 years. The period of Jupiter at 4.3 AU is $\sqrt{(4.3^3) \cdot (12^2) / (5.2^3)} = 9.02$ years, compared to the current 12 years at the location of 5.2 AU. On a retrocalculated ephemeris Jupiter will not appear in the night sky on September 21, 2300 BC.

Among 13 Mesoamerican ceremonial sites I investigated there are 20 alignments using horizon locations (to a mountain or volcano) for the setting of the Pleiades. See the chapter "Olmec Alignments."

[\[return to text\]](#)

Note 10 --

To return the "Day of the Dead" celebrations to September 6th, the old day of the equinox, is astounding!

Mandelkehr. by the way, notes that the Pleiades culminate on about November 1 today. They do not. Culmination happens on November 14th today.

Note 11 --

Bernadino de Sahagún recorded his observations of Aztec culture from native sources after AD 1527 in *Historia de las cosas de Nueva España* (translated in AD 1829). The culmination of the Pleiades for Mexico City, equivalent to the ceremonial center of Teotihuacan, is as follows.

I think that the date of the "Day of the Dead" may have been established by the priests at Teotihuacan at about AD 200, when the city was built. At that time the Pleiades culminated between October 20 and October 22, Gregorian (October 20 to 21, Julian). Teotihuacan was the undisputed primary religious center until circa AD 700, and set the standard for most of Mesoamerica. Its influence lasted into the Aztec era. The Aztecs still celebrated the "Day of the Dead" on October 20 or 21 in about AD 1550.

-- The entry "original" (below) can be used for all years before 685 BC, where the dates should be reduced by 15 days to reflect the earlier location of the equinox.

-- The westerly settings of the Pleiades marked "<--" appear with great frequency among the significant alignments at Olmec and Valley of Mexico ceremonial sites. In all, for the 13 sites I looked at, there were 25 alignments with the setting location of the Pleiades. More details can be found in the chapter "Olmec Alignments."

Culmination of the Pleiades -- Mexico City, 19.25 deg n latitude					
year	Julian	Gregorian	midnight culmination	--westerly setting-- azimuth	deg n of w

Note 12 --

Ussher paraphrases from the New Testament as follows: *"He told them it was necessary for Christ to suffer and to rise from the dead the third day."* This is attributed by Jesus to "Moses and the prophets" and thus from very old sources. In Mark 12:26 Jesus speaks of the Books of Moses, and, speaking of God, says, "Yet it is of living men, not of dead men, that he is the God." This is in distinction to Osiris, the Egyptian God of the dead.

[\[return to text\]](#)

Note 13 --

The front of the turtle is on the left. Hunahpu and Xbalanque appear as headdresses of two monsters or gods peering out of both ends of the turtle, not unlike the heads showing out of the two mouths of the celestial serpent bar. The face on the side (center) of the turtle names the crack as "Precious Torch Death." A footnote (48 on pg. 465) in Freidel and Schele, *Maya Cosmos*, suggests an extended name from another source of "Yellow Torch Death Skull." "Yellow" is the south directional color; the "torch" may be in reference to the "image of the first turtle" which appeared in 10,900 BC as a brilliant torch.

Note 14 --

The *Book of the Dead* is a collection of unrelated spells which never follow the same order, and are often unique. These include the spells engraved in pyramids from Unas's time on, spells painted on coffins, and later written scrolls included with coffins.

[\[return to text\]](#)

Note 15 --

If my estimate of the travel of Jupiter through the asteroid belt is correct, then Jupiter would

have entered a separate "clump" of asteroids at about 4 AU, in about 2400 BC. After that a change in the plasma of Jupiter to dark mode could have existed for a period of 50 years, only to return to glow mode with the electric activity of Venus in 2349 BC. This would be almost coincidental, but it was held as very significant, religiously, worldwide.

From the dates recorded in the sculptures at Palenque, it could be suggested that the Moon arrived about a decade after 2349 BC, in 2337 BC.

However, the *Chilam Balam* states that Jupiter was not "weeping" when the Moon arrived. This could mean that Jupiter was located behind the Sun (on the other side of the ecliptic), so that the plasma tail could not be seen, or that there was no plasma outpouring.

[\[return to text\]](#)

Note 16 --

Although I would, at first thought, tie the first appearance of the Moon to 2349 BC, it seems almost certain that it would take some time before a regular orbit was established. In fact, from some sources it seems that the Moon did not show up until a decade later. With the Earth on an elliptical orbit, and the Moon on a different but nearly identical orbit, it would take time before the Moon's orbit stabilized. The Maya *Chilam Balam* takes note of an Earth shock and the first sight of the Moon, but no dates are even hinted at. It might simply be part of a panoply of associated events. That includes the first note on the establishment of a calendar, "days were added."

[\[return to text\]](#)

Note 17 --

Velikovsky originally established the 52-year interval. This interval has been confirmed by many researchers from other sources, at times as 104-year intervals. In Mesoamerica the interval is confirmed from the "52-year celebrations" recorded at the time of the Spanish invasion, although based on Tun years of 360 days, and specifically from the apparent intervals when the "primacy" of religious centers passed from one location to another after about 1400 BC.

But the actual interval of approaches of Venus did not remain the same after 2193 BC. It became shorter by a few years. Mesoamerica celebrated the "52 years" as an interval based on a Tun year of 360 days, not solar years. This has caused considerable confusion among researchers.

[\[return to text\]](#)

Note 18 --

Amun first appears at Thebes (in Egypt) after 1985 BC, in the Twelfth Dynasty during the Middle Kingdom. Amun appears to be a reconfiguration of Ra as the Midnight Sun, who had

disappeared from view over 200 years earlier. Only after circa 1550 BC (at the beginning of the New Kingdom) does Amun become widely recognized in Egypt (as Amun-Ra). After this time he starts to assume the attributes of the older Gods. He was called, "the king of the Gods," by the Thebans.

Jupiter appears under a number of other names in Egypt at this time, which combine "hidden" with the original name for "sun," although the original "sun" designation universally referred earlier to Saturn at the North Pole. In Canaan Jupiter is known as Baal Tsaphon, the Hidden Lord. In 500 BC Herodotus claims that the Egyptian Amon is Zeus, that is, Jupiter.

Note 20 --

See Book 2 of the Shu and the introduction by James Legge to *The Sacred Books of the East*, Volume 3, *The Shu* (1879).

Of the Books of the Xia, Legge notes:

"Of the still earlier dynasty of Hsiâ [Xia], there are only four documents, and we have no evidence that there were any more when the collection of the Shu was made in the times of Kâu. ... In the last of them a celestial phenomenon is mentioned, which has always been understood to have been an eclipse of the sun in Fang, a space of about 5 1/2 degrees from pi to sigma of Scorpio, on the first day of the last month of autumn. P. Gaubil thought he had determined by calculation that such an eclipse really took place in the fifth year of Kung Khang, B.C. 2155. Doubts, however, have been cast ... on the accuracy of his calculation."

Others have demonstrated that the eclipse could not have been seen in China. Scorpio, however, is two houses over from Capricorn, although retrograde of normal planet travel in the ecliptic, where Rockenbach places the comet of 2060 BC, "in the constellation of Capricorn, and within the space of sixty-five days it traversed three signs in the sky." This suggests a comet outside the orbit of Earth, fairly close by, and seen in retrograde motion, as would happen since Earth would be traveling at a faster orbital speed (which is meaningful only if we assume that these two events are related).

[\[return to text\]](#)

Note 21 --

That Mercury had a substantial atmosphere can be surmised from two facts. First, that in remote antiquity, when Mercury stood between Saturn and Mars, it appeared as white, and looked much larger than Mars (which, however, was closer to Earth). In Mesoamerica it was misidentified as Venus from the perusal of ancient codexes. So in the *Popol Vuh's* recollections from the most ancient narratives (10,900 BC to 8347 BC) Mercury is called "Sovereign Plumed Serpent," a name otherwise reserved for Venus. Venus only came into existence after 4077 BC.

Second, in the earliest diagrams of the standing stones of the Neolithic Avebury monument in England, there are two interior circles of equal diameter, which most likely represent a large Mercury and much closer Mars. Since Avebury probably dates to after 3100 BC, the construction of these two smaller circles is probably schematic and from memories. This is duplicated at Stonehenge, and one other location that I was aware of (but cannot place). The small planets shown below Saturn are remembered, rather than actual. This would not have been Venus, which is twice the diameter of Mars.

The side view of Venus figurines of the late Upper Paleolithic also render two lumps offset from each other and located below Saturn -- depicted as if the figurine had large buttocks and was pregnant to boot.

The misidentification of Mercury as Venus has carried forward to the current era, where Talbott claims that the white globe between Saturn and Mars was Venus. The misidentification is partially due to the fact that Mercury simply has never been considered as part of the "Polar alignment."

Talbott claims multiple plasma streams in glow mode as impinging on "Venus" (Mercury) in a circular form, making the planet look like a petaled flower or a seashell. The form of multiple streams would be correct for a planet with a magnetosphere. The separation of the glow mode plasma stream from Saturn would not be expected to separate into distinct bundles (making it look like a petaled flower) unless the planet had a magnetic field. That eliminates Venus.

What is also clear, is that Mercury should, because of its atmosphere, be practically devoid of so-called "impact craters" -- as the Earth is also -- so that in losing most of its atmosphere (at a late date) this would show. And it does. The cratering of Mercury is noted by astronomers to have a look of freshness unlike the craters of the Moon or Mars. All of the cratering happened in June and July of 685 BC. This was a year after the atmospheric fire on Mercury.

Note 24 --

Mandelkehr blames the movement of people to a climatic downturn, which I blame on an increase in the orbit of the Earth. Mandelkehr blames it on dust generated by a comet of the Taurid complex, something, by the way, totally overlooked by the astronomers Victor Clube and Bill Napier, in their book *The Cosmic Serpent* (1982), or in any of their later talks. I will blame the 200 year climatic downturn after 2193 BC on nanometer dust in the stratosphere.

[\[return to text\]](#)

Note 25 --

"The 108-year Cyclicism of the Ancient Catastrophes" in *Aeon* (1990). I would expect such hard-and-fast dates because planetary orbits can be expected to remain the same. Planets do not leave their orbits. It is not as Stephen Jay Gould wrote, in *Ever since Darwin* (1977): "Mars then left its regular position and almost collided with the earth in about 700 BC." That's just nonsense.

An intruding planet would repeat an earlier appearance except to be perhaps a few hours earlier or late compared to the previous overflights. This is because the planetary orbits are first of all circular, and a path of a planet on an elliptical orbit drawn across these circles will not deviate by more than a day in crossing an orbit currently from the date of crossing an orbit at the same inclination to the equator of the Sun at an earlier time.

However, the orbit of an intruding planet which crosses the path of another planet is governed by apsidal precession. All the planetary orbits are ellipses, which thus have two nodal points: one at the Sun, and the other some distance away from the Sun. This second nodal point slowly revolves around the Sun, and thus the whole shape of the orbit revolves around the Sun -- counterclockwise as seen from above the north pole of the Sun. This rotation is called apsidal precession.

The Moon's period of apsidal precession around the Earth amounts to about 19 years. The Earth's orbit takes 112,000 years to rotate around the Sun today (estimates vary). The orbits of Mars and Mercury were very elliptical. The orbits of Mars and Mercury caught up with the orbit of Earth every 1150 years. Overrunning the orbit of Earth would therefore only happen periodically.

[\[return to text\]](#)

Note 26 --

I doubt the use of the Ibis symbol as indicating Thoth before dynastic times. Mandelkehr may have reference to the Narmer Macehead of 3050 BC which shows an Ibis above a temple structure, thought to be the temple of Buto in the delta, which, however, was under water at that time. Buto may be a reference to Saturn in the northern "sea above" with the Ibis representing Uranus seen above Saturn at an earlier time.

De Grazia lists as his sources for Mercury the following: E. A. Budge *Osiris, The Egyptian Religion of Resurrection* (1895, 1961); J. Bonwick *Egyptian Belief and Modern Thought* (1878, 1956), Theosophical literature, *Myth & Symbol in Ancient Egypt* (1959, 1991); D.B. Redford "The Sun-Disc in Akneton's Program: Its Worship & Antecedents I", *Journal of the American Research Center in Egypt* (1976); and *Cambridge Ancient History*, "Early History of the Middle East."

The Terror of Venus

This chapter concentrates on the period surrounding the events of 1492 BC, including an electric contact by Venus, the Exodus of Moses, the fall of the Middle Kingdom of Egypt, and changes experienced worldwide.

"In the Bronze Age," reads a book on the prehistory of Crete, "Crete was the first center of naval power, where people lived in peace and plenty in unwallled cities. This lasted for over 1500 years."

"About 1400 BC a great catastrophe befell the island, a catastrophe of which we have no clear record in history, but one which is marked by destroyed and abandoned cities and villages, and from which the civilization as a whole never recovered."

-- R. W. Hutchinson, *Prehistoric Crete* (1962)

The same author notes in the next paragraph, however, that, after an interval of 400 years, "... a new life and culture arose in Crete. Even this revival of culture in Crete, however, did not survive the seventh century BC, and a new decline set in... ." [\[note 1\]](#)

The story of the sudden decline of civilization is repeated over and over, all following shortly after three dates -- 2400 BC, 1500 BC and 800 BC -- for one locality after another: in Greece, in the Middle East, in India, in China, in Mesoamerica, and in South America. This is especially true for the 8th and 7th century BC when some 300 cities in the Middle East were destroyed by earthquakes and fire. These incidents were better remembered. I will return to the 8th and 7th century BC later. The current topic is the era of 1500 to 1400 BC, when vast migrations of people are noted, apparently caused by natural disasters and worldwide changes in climate. [\[note 2\]](#)

We are now dealing with events not as remote as the flood of 3147 or the shock of 2349 BC. There are more records for this later period (although still pitifully few). The incident of circa 1500 BC was a worldwide catastrophe, in some ways larger in scope than the early flood events, for the Earth was moved considerably further from the Sun. Farmers and herders were affected; some civilizations never recovered. The later and much more frequent disruptions of the eighth and seventh century might be considered minor events in comparison. [\[note 3\]](#)

Whole nations of people migrated following 1500 BC. Others disappeared. It may be conjectured that Mesoamerica developed its bloodbath of controls over the spiritual world at this time. India disappeared into a Dark Age which did not lighten for 700 years. China, on the other hand, started its civilization in earnest. There were probably as many clever solutions to the catastrophes as there were desperate failures. Those who coped, those who found the imagination to handle unpredictable disasters, survived.

It was in 1492 BC that the dragon Venus "attacked" Earth. This is the planet which had been "expelled from Jupiter's skull" at the time of the confrontation with Saturn (3147 BC), had swung into an orbit nearly identical with Earth's orbit of that time. Venus would blaze through the sky for 2400 years with a coma and a 30 million mile (48 million km) long tail. Venus is the only deity which is almost universally recognized as having been "born" during historic times. The birth of Venus was seen by humans in 4077 BC (when Saturn went nova), or alternately seen as the separation from Saturn and Jupiter after 3147 BC.

I should point out also that the electric contact with Venus was the core of Velikovsky's book *Worlds in Collision*, where it is supposed that Venus traveled on a path that brought it close to Earth -- "nearly collided." This of course is nonsense, since planets do not alter their orbits to nearly collide with one another. If this had happened, we would not be here to tell the tale of Venus. But it is obvious that Mars after 800 BC did come very close, as it had at two earlier times, with an unbelievable amount of damage done to Earth by such a tiny planet. If this had been Venus, Earth would have been totally destroyed. The contact, the "near collision" with Venus in 1492 BC happened at a separation distance, I estimate, of some 10,000,000 miles (16,000,000 km).

In Mesoamerica, Venus appears as the feathered serpent Quetzalcoatl. In Greece, she was called Athena, sprung fully armed from the skull of Zeus (so say the Greeks). In Upper Egypt, she was Isis and in the south she was Hathor the celestial cow. In Lower Egypt and Libya, she was identified with the warrior Goddess Neith, who persisted to classical Greek times from 10,900 BC. Neith was held as the generatrix of mankind and the mother of the Gods. The Egyptian queens and mothers of the first dozen Horus-named pharaohs after 3150 BC took *Neith* as their name. Plato says that Neith is Athena. That is not true, but it will do. [\[note 4\]](#)

Venus lined up between the Sun and Earth at great intervals. As retold in the previous three chapters, starting in 2349 BC, Venus assumed the disastrous position between the Earth and

the Sun four times, ending with the last electric contact of 2193 BC. Most likely the orbits of both Earth and Venus were eccentric, and Venus may have crossed over the orbit of Earth. But this last would not *per se* have resulted in an interaction. And as I mentioned in the previous chapter, when electric interactions did happen, the distance between Venus and Earth was probably on the order of 17- to 20,000,000 miles (27- to 32,000,000 km) in 2349 BC and 10- to 12,000,000 miles (16- to 19,000,000 km) in 1492 BC. The destruction of the Earth was electric, not gravitational. [\[note 5\]](#)

Since 2193 BC (the second "contact" in this era), and for 700 years afterward, Venus and Earth were never again in line with the Sun at the same time. Nothing more spectacular happened than the displays of the coma and tail of Venus as the planet ranged across the skies, approached and retreated over the span of the year, and periodically crossed Earth's path to move deep into the night skies of the south. Venus was discharging its birth legacy of surplus charge. It would continue to do so perhaps until sometime before the time of Aristotle who commented on the status of Venus as a planet -- the Babylonians, somewhat earlier, had not considered Venus to be a planet because of its strange behavior.

In 1492 BC Venus moved past the orbit of Earth on the Sun-side of Earth, and the plasmasphere tail of Venus touched the leading edge of Earth's plasmasphere. Both planets suddenly experienced a massive electric repulsive impulse -- affecting the orbits of both planets. This veered the Earth from its orbit to a path of greater radius around the Sun, and moved Venus also. Although the year became longer for Earth, it seems that Venus perhaps only changed the eccentricity of its orbit. [\[note 6\]](#)

The date of 1492 BC is listed by Velikovsky as minus 1492. A number of late medieval chronographers use 1495 BC instead. Johannes Hevelius (in AD 1668) offers 1495 BC, Abraham Rockenbach (AD 1602) uses 1493 BC. James Ussher (AD 1650) uses 1491 BC. Sethus Calvisius (ca AD 1600) uses 1495 BC. Josephus (ca AD 80) inadvertently also uses 1491 BC (my date of 3147 BC less 1656 years), but identifies it as the year of the flood of Noah (1656 years after creation, where I have used the true date of creation in the calculation). The tomb of Senmut, Vizier to Queen Hatshepsut of Egypt, was started in circa 1500 BC, in Thebes. The construction was halted in 1493 BC, the astronomical year -1492, and never completed. (But dated to circa 940 BC in Velikovsky's revised chronology.)

... a sequence of events

A sequence of events can be established. Venus passed on the day side of Earth, between Earth and the Sun. There is good evidence (from Olmec Mesoamerica) that a plasmasphere contact (an Earth shock) happened on the Gregorian equivalent calendar date of April 19th, 1492 BC. This date is developed in the chapter "Olmec Alignments." The book of Exodus says it happened on the 14th day of the first month of spring, held to be April.

There is evidence brought forward by other researchers that the Southeast Pacific

experienced a gigantic impact between 1500 and 1400 BC, but of course the information has been attributed to a meteor impact. There was no gigantic "meteor impact" in the South Pacific, even though tsunami waves traveled (it is presumed) as far as the coasts of China and New Zealand. It was a compressive electric shock from Venus. Additionally, the most likely location of the compressive impact of 1492 BC would be just south of the equator. The impact would also have been four times as massive as the repulsive impact of 2349 BC which had shoved over the Himalayas, but the lever arm of the applied torque was much shorter. [\[note 7\]](#)

Velikovsky wrote the following, correctly associated with the 1492 BC event:

"In the manuscripts of Avila and Molina, who collected the traditions of the Indians of the New World, it is related that the sun did not appear for five days, a cosmic collision of stars preceded the cataclysm; people and animals tried to escape to mountain caves."

He quotes, for this, Brasseur de Bourbourg from *Sources de l'histoire de Mexique* (1860) as follows:

"Scarcely had they reached there, when the sea, breaking out of bounds following a terrifying shock, began the rise on the Pacific coast. But as the sea rose, filling the valleys and the plains around, the mountain of Ancasmarca rose too, like a ship on the waves. During the five days that this cataclysm lasted, the sun did not show its face and the earth remained in darkness."

-- Velikovsky, in *Worlds in Collision*, p.76

The use of this source is misleading, since the quoted paragraph is not about Mexico, despite the book's title. Francisco de Avila and Christoval de Molina documented Peru and the Inca. The mountains of Cerro Ancasmarca are in Peru at 11.5 degrees south latitude, and inland near Cusco.

The Andes might have lifted. Some geological researchers think the Andes were raised suddenly by as much as 10,000 feet (3300 meters), although 3000 feet (1000 meters) would be more realistic. Charles Darwin, writing in 1835 during his voyage on the Beagle, noted:

"... the Cordillera [the mountain chain of the Andes] itself is absolutely modern as compared with many of the fossiliferous strata of Europe and America."

It is quite possible that the Andes in fact moved up quickly, within a day or week or a year. At one time the marginal agricultural conditions surrounding Lake Titicaca, at an altitude of 12,500 feet (4000 meters), which is above the tree line, in the Alto Plano of Central Peru adjacent to Bolivia, were used to justify this. It was suggested that the monumental constructions of Tiahuanaco, south of the lake, dated to much earlier times. But the best archaeological evidence of changes in the region is that it was not settled until after 1400 BC.

Construction commenced in about 800 BC. [\[note 8\]](#)

The impact was near the equator (because this was just after the vernal equinox), and the force would have passed through the Earth below the equator. In response, the southern hemisphere tilted away from the Sun ("down"), and the Earth would have been subjected to an immediate gyroscopic reaction. A look at a globe will reveal that most of the Earth was spared from utter destruction because the 1500 mile (2400 km) diameter compressive Earth shock was experienced in the Pacific.

The shock, writes Velikovsky, was felt at midnight in Egypt. A location in the Pacific west of South America would have faced the Sun and is, in fact, about 180 degrees removed from Egypt -- noon in the Central Pacific at 120 degrees west longitude, north of Easter Island and south of the equator. This is based on the complete lack of islands in the region of the Eastern Pacific north of Easter Island.

The impulse that fell below the equator of the Earth would first have tilted the upper half of the Earth's axis of rotation toward the Sun. Asia and Europe initially tilted in this direction, bringing India, Arabia, and the lower Eastern Mediterranean in direct line with Venus -- as the Earth rotated. This condition would have held for maybe a day, for the simultaneous gyroscopic reaction torque would move the spin axis to the forward direction of the Earth's travel on its orbit (the celestial east direction). Since the axis of the Earth would initially have pointed mostly to the rear portion of the Earth's orbit (it being early spring), the effect would have lasted some time. (See Appendix B, "The Celestial Mechanics" for the effect of a gyroscopic reaction torque.)

As the Earth's axis tilted and moved through a clockwise loop, the path of the subsequent electric arc would have angled up past the equator, past Australia, but might have crossed land in Southeast Asia, India, Arabia, and the Eastern Mediterranean. The arc traveled west, whereas the cloud of suspended water vapor over the Pacific, moving much slower, moved east, as all weather does.

At the point where the arc reached the Eastern Mediterranean, the axis would have completed about half of its sweep, and the northern hemisphere would have started to tilt away from the Sun again and angle toward the rear portion of the Earth's orbit (the celestial west direction). This would have caused the path of the arc from Venus to now angle back to the equator, so that North Africa might have been on the path, the Atlantic would have been crossed, and landfall would be made in Central America or upper South America. The water in the atmosphere could have caused the five days of darkness. This path and the atmospheric conditions might explain the difference between the date of the start on the 14th given by the Bible and the date of completion on the 17th of the equivalent same month used in Mesoamerica.

I cannot be certain of the arc's path. But certainly the effects would have been felt away from this path also. The initial shock would have been felt worldwide. With the displacement of

the air with the impact, the atmosphere would have reacted with hurricane force winds in the direction away from the impact location in the Pacific. It is also uncertain how long the electric repulsive force would have lasted -- to be replaced by an attractive force -- perhaps only minutes. It was not in effect by the time Southern Asia faced Venus.

Whereas in 2349 BC the year had lengthened by 20 days, and in 2193 BC the year had lengthened by 13 days, in 1492 BC the year lengthened by 87 days. This was recognized in remote antiquity. Ussher paraphrases the following, from sources I cannot place:

"... as the Israelites continued to die in the wilderness, Moses composed the 90th Psalm, 'Lord thou hast been our refuge.' He also showed that the normal age of men was reduced to 70 or 80 years. Therefore, the age of man was shortened to a third of what it was before 1490 BC."

This would be correct if we read this as "by a third" rather than "to a third," for an increase of 87 days represents a change of 30 percent in the length of the year (of 273 days). Ussher probably meant to make a comparison to the ages of Abraham, Isaac, Jacob, and Joseph which ranged from 100 to 200 years.

Venus had been positioned closer to Earth this time than it had in 2349 BC, on an orbit estimated to be 9,000,000 to 10,000,000 miles away from Earth. It would have taken some time for Venus to overtake and pass Earth on its parallel orbit. Actually, the movement past each other would be determined by the width of the two plasmaspheres: certainly 320,000 miles (515,000 km) (40 Earth diameters, 20 to 30 diameters today) for Earth, and a lesser width for Venus (since it has no magnetosphere), which would determine how long the electric arc might have lasted. At most it would have taken about six days for Venus and Earth to pass each other. [\[note 9\]](#)

This would account for the fact that an electric arc, initiated in the South Pacific, managed to travel across the Earth at least as far west as the Eastern Mediterranean -- over half the circumference of the Earth, representing a half day. It seems to have traveled through lower Asia and India or along the Indian Ocean, hit land in Arabia, continued through the Sinai and lower Egypt, and probably continued through the Mediterranean along the coast of North Africa, to cross the Atlantic and approach the Americas. Arabia's deserts are still marked with large areas of scorched stones.

The initial repulsive electric impact in the Pacific would have reversed itself (as an opposite charge was induced), and began to lift vast amounts of ocean water into the atmosphere and stratosphere -- which would have spread throughout all of the world within a few days or a week. The levitation of seawater would have ceased even before the electric arc was established. Thus, although I estimate that Venus and Earth were electrically visible to each other for a span of 6 days, the arcing might have dissipated at the water-soaked upper atmosphere after a single rotation of Earth. [\[note 10\]](#)

After the initial shock, Venus was seen later that day in the Middle East as a gigantic red glowing globe. We have a number of recollections and descriptions of this. The water vapor from the Pacific, traveling toward the east, had not reached the Middle East yet. If the red globe were the size of the Moon, it would have been twice as far away as the Moon is today, or about a half million miles (805,000 km). But it is more likely that Venus had a much more extensive coma, and would look huge even at far distances. We have to assume that it looked red because of local dust in the air, from arcing across India and Arabia. The globe in the sky was memorialized as an attacking demon or the God Typhon.

Because Venus must have carried a much lesser coulomb charge since the contact of 2349 BC, there were no disconnected plasmoids released. Instead there apparently was a continuous arc from Venus striking Earth, as recorded by Moses in the book of Exodus and recalled later by the Greeks as the legend of Typhon.

The major effect of the contact with Venus, in addition to the change in the Earth's orbit, was the addition of a massive amount of dust (from forest fires) to the stratosphere, and water vapor to the atmosphere (the result of the initial compressive contact to the waters of the Pacific and the subsequent attractive electric force).

The Earth dimmed, and agriculture failed. A people "walked in darkness" for 40 years (Bible) and "a generation grew up in darkness" (Mesoamerica). The Earth had been subjected to electric arcing earlier (in 2193 BC) with a corresponding 200-year downturn in climate. The electric exchange with Venus in 1492 BC was largely moderated by the amount of water vapor in the atmosphere. The rain clouds that hung above were darkened by the nanometer dust in the stratosphere. The gloom lasted 40 years.

... some details

Mesoamerican retellings mention the total destruction of buildings and villages. The coastal regions of South America must have become largely depopulated. People at latitudes further north from the strike point and the path of the arc were not directly affected, except for earthquakes, tsunamic ocean tides, and the aftermath of a "fallen sky" -- the result of massive amounts of oceanic waters vaporized and forced into the atmosphere, and held there by the failure of the Sun to break through the dust of the stratosphere. The clouds never warmed up to release their moisture and were perhaps also kept suspended by the increased electric charge of the Earth. Forty years in the desert, however, or "a generation," is a lot less than the 200 years of climatic downturn experienced in 2193 BC, or the 1500 years of shadow of 10,900 BC.

Velikovsky had suggested that the two planets may have closed to as little as 6 diameters in distance from each other (48,000 miles, 77,000 km) and may have circled each other. I seriously doubt both of these. This has become part of the "collision" scenario of Velikovsky for which he has been faulted. It is, in fact, one of the few valid objections stemming from a

consideration of the physics involved.

"Because of the proximity of the earth, the comet [Venus] left its own orbit and for a while followed the orbit of Earth."

-- *Worlds in Collision*

That is just nonsense. A planet does not "leave its orbit for a while." At the time of Velikovsky's writing this was needed, despite the fact that a close approach of a planet as large as Venus was known to be completely untenable, for Velikovsky needed to account for a number of things which could only be achieved through gravitational interactions. One of these is the oceans and waters which stood up to the sky. Another is the vast destruction encountered by Earth and its people during this period -- to the point where some who recorded the event claimed that almost all humanity died.

Velikovsky has documented the interaction between Earth and Venus for this period in detail from Indian, Babylonian, Egyptian, Mesoamerican, and Biblical sources (including Bible commentaries), as well as from Roman and Greek recollections. There are tales of 6 or 10 days of darkness (Middle East) and days when the sun never set (China). The world was swept by fierce hurricanes and later versions of *The Epic of Gilgamesh* incorporate the hurricanes into its description of the earlier flood. Recollections that "ocean waters stood up and reached to the skies" are found in the Middle East, India, and in Mesoamerica. [\[note 11\]](#)

Considering the fact that humans only developed subjective consciousness after the time of Moses, we would expect there to have been a lack of descriptive memories of environmental catastrophes before this time. However, memories of stupendous doings of the Gods, which would be retold and replayed as dramas, would be remembered. And at this time, ca 1500 BC, we have already experienced 500 years of efforts at written histories -- at least as repeatedly retold "legends."

Even as late as the seventh century BC, these histories include very little of natural disasters. Exceptions are the writings of the prophets of Israel and the Chaldean astrological records. The Chinese pay almost no attention to the heavens. All this is not different from our lack of attention to natural events today. [\[note 12\]](#)

The electric arc swept across the Middle East. This was a Birkeland stream of plasma in arc mode seen as if at close quarters, identified as a monstrous twisted snake, with multiple heads in the upper sky -- the monster Typhon of legend. The Greeks insisted that the planet god Zeus came to save the world from this creature, mistaking the sphere of Venus seen above the dragon for Zeus (Jupiter). [\[note 13\]](#)

The battles of Marduk and the dragon Tiamat, the revenge of Horus on Seth, the battle of Krishna and the serpent, all describe similar details, although likely referring to 2349 BC rather than 1492 BC. Some people in antiquity correctly identified the large red globe at the

apex of Typhon's multiple heads as Venus, and understood it to be the cause of the devastation. Some people called it a comet. To the Israelites leaving Egypt, the column of lightning was the arm of their God Yahweh, who spoke to them from the overhead globe.
[\[note 14\]](#)

Velikovsky identifies a series of events as the ten plagues visited on Egypt by the God of the Israelites. The Egyptian Ipuwer Papyrus echoes the plagues of Exodus one for one. Velikovsky proposes causes for many of the plagues based on presumptions about the comet tail of Venus, which (he claims) would have swept into the Earth's path before the arrival of Venus. The "tail" of a comet or planet faces away from the Sun. The main tail is an extension of the planet's plasmasphere and is shaped by the shadow of the Sun's electric field in the direction away from the Sun.

There is a second tail of particulate matter, which curves, but it curves in a direction lagging the orbital movement of the planet Venus. This tail spreads out as the ionized particles repel each other. There is thus no tail which sweeps into the path of Earth prior to an electric field contact. There may, however, have been earlier contacts between the double layer of the plasmasphere tube of Venus and the Earth's plasmasphere.

Thus it is possible that before 1492 BC the tail of Venus had been experienced perhaps by having the edges of the plasmaspheres of Earth and Venus brush against each other, causing an interaction of the outer layers without establishing a clear sight-line between the two planets. Thus, as Venus was passing Earth on the Sun side the tail could have reached Earth from perhaps as far as 30,000,000 miles (48,000,000 km) away. The effects of this probably were noticed during a passage of Venus two years earlier. An electric interaction of the globes would only occur when the plasmaspheres of the two planets actually lined up.
[\[note 15\]](#)

Velikovsky proposed that Venus approached Earth from the Sun side, and thus Earth at first intercepted the plasma tail of Venus. Actually, Venus likely caught up with Earth, with Venus moving faster than Earth because Venus was on an inner orbit. The edges of the plasma tail would certainly have "touched" the Earth's plasmasphere and transferred electric charges and gas ions constituting the boundary layers of the plasmaspheres. This might have resulted in changes in the weather during these earlier near alignments. Storms could have been a fact, and, as a result, Egypt would have been blanketed with dust, not from Venus, but from the Sahara.

I also disagree with Velikovsky's proposed makeup of the tail of Venus. He assumes a composition of fine ferrous dust at the far end of the tail, larger particles closer in toward Venus, and then hot cinders and rocks in the tail portion closest to Venus -- as if Venus was a tossed firebrand. Although I will (reluctantly) concede the presence of dust (ionized silicon compounds) or hydrogen and methane gases (which he identifies with petroleum), the tail of Venus was a plasma -- composed of electrons, protons, and ionized atoms. The outer edges of Venus's plasmasphere tail would have had a density approaching the classical notion of the

vacuum of outer space. The tail of matter was composed of ionized particles.

It is thus not likely that the plasma tail would be composed of a hail of hot stones, despite the fact that the surface of Venus was at that time still incandescent. It is more likely that the grit and hot rocks were generated from the Earth's surface where the arc from Venus traveled over land surfaces and explosively launched dust, cinders, and rocks into the atmosphere.

[\[note 16\]](#)

One would at first suggest that the electrical proximity of a large planet would have also severely stressed the Earth's crust, and there are many references to this sort of phenomena in antiquity -- mountains moved and the ground swelled underfoot the fleeing Israelites, who were in the process of leaving Egypt when this occurred. (The exodus will be discussed below.) Both the Bible and the records from the Americas speak of the ground opening up and of caves closing on fleeing humans. Lava flows and volcanoes burst forth. The Arabian Peninsula lifted and folded. Indian sources speak of mountaintops being lifted up, cast into the air, and ground into dust. The land west of the Zagros mountains rose, and the Euphrates river moved a hundred miles west. South American sources speak of the rising ocean tide and the simultaneous rise of the ground as if it floated on the waters. There is no written history for the period of 1500 to 1400 BC during the Shang dynasty in China. In 1400 BC, in response to some calamity, the capital had been moved and the Shang is renamed as the Yin for its new location.

The anecdotes which I have collected in the above paragraph from other sources are obviously primarily imagined to be caused by the gravitational forces of a large nearby planet, and assumed to be operating on the Earth's crust. Nearly nothing has been developed (or imagined) of the effects of the repulsive electric impulse forces operating in compressing rather than lifting the crust, followed by an attractive force, both from a great distance, and both of which far exceeded any forces which gravity could have produced at much closer distances (by a factor of billions on billions). This last would have operated on the facing crust, and cannot, like gravity, be assigned to operate on the bulk of the Earth. See Appendix B, "The Celestial Mechanics," which discusses the repulsive (and attractive) electric forces as the agent of destruction, and as the primary mechanism behind changes in orbits.

Another element of the destruction was the resistance of the Earth's crust to the compressive initial shock -- but not to the gyroscopic reaction, which would have been a smooth transition. Earthquakes, in fact, probably lasted for decades. Hurricane winds were probably due both to the traveling arc and the compressive shock, not to the gyroscopic motion of the Earth. I also feel that many of the geological disturbances attributed to this era might more properly be located in the span of time of 800 to 685 BC.

Last, let me assure the reader that an electric arc from 10,000,000 miles (16,000,000 km) is very possible, even if this seems like an absolutely impossible distance. First, the double layers of plasmaspheres are conductors in that they are composed of disassociated ions. It is like an electric cable.

Secondly, the interior of a plasmasphere and tail of a planet is consistently at about the same electric potential, so that it also is an effective conductor of electricity. The arc did not travel through empty space. Travel over this short distance might become easier to believe when we reach 685 BC, where we will meet up with a disconnected arc from Saturn to the Sun, traveling an absolutely unbelievable distance of 480,000,000 miles (773,000,000 km).

Yet Velikovsky, despite his initial claims for the electrical nature of the planets of the Solar System, was not ready to carry through with this concept. The best he could do was to produce a spark between Venus and Earth -- at which point the waters of the Red Sea, which had opened up a passage for the Israelites by standing up as a tide reaching to Venus (and imaginatively assigned to gravitational effects), fell again. The Israelites placed the climaxing event of their escape from Egypt on the night starting the 14th day of Aviv, in 1492 BC. Their day is counted from sunset. The "climaxing event" actually is not the opening of the "Red Sea" but the earlier earth shock of worldwide proportions. The opening of the "red sea" is clearly a descriptive recollection from 2349 BC, and may have had nothing to do with the ocean which today we call the Red Sea.

The 14th day of Aviv, where Aviv is the first month of the year after the spring equinox (Exodus 12:18), is marked with a sunset alignment of April 19 by the Olmec San Lorenzo site built around 1450 BC (see the chapter "Olmec Alignments"), and repeated at almost every later site.

The Earth was shrouded in low clouds for years, recalled in Biblical and Egyptian sources, and even more vividly in Mesoamerica, where sources claim that "the people grew up in darkness." However, the pillar of "cloud by day" and "fire by night" which the Israelites followed through 40 years of desert wandering was (possibly) from the electrostatic induction of the Ark of the Covenant -- not from a continued arc from Venus. It is even more likely that the pillar represents a plasma plume above the north magnetic pole of the Earth, the result of a relocation of Earth much further away from the Sun. I'll discuss this further below. [\[note 17\]](#)

The crust groaned endlessly. The Egyptian scribe Ipuwer writes, "Oh that the earth would cease from noise, and tumult be no more." As Moses met God on Mount Sinai, the Earth groaned, "Lo tirzah, lo tin'af, lo tignof..." -- the Ten Commandments, brief, to the point, "Kill not, Steal not..." [\[note 18\]](#)

After the electric contact with Earth, the path of Venus was bent toward the Sun (or remained nearly the same, as suggested above) and the path of Earth was angled away. Velikovsky suggests that Venus reapproached Earth after six days and exchanged yet another traveling plasma discharge. Still attracted toward each other (presumably gravitationally), Venus, now hidden by the fallen skies on Earth, proceeded to yet another encounter six weeks later on the day of the Law Giving at Mount Sinai, says Velikovsky. The planets subsequently did not come close enough in their travels to cause any further interactions for the next 50 years. The first return of Venus after six days is quite likely, although it was not a return, it was probably

just a contact with the trailing edge of the plasmasphere of Venus. The second return, after six weeks, is unlikely. [\[note 19\]](#)

Soon after the electric contact with Venus, with the Earth now much further away from the Sun, northern climates changed for the worse. The climate became cold. Grapes no longer grew in Scandinavia. The cloud cover affected agricultural production everywhere. During the first years, massive rainstorms stripped the Southern Balkans of soil and trees. Then a drought set in. The water table dropped precipitously and rivers dried up. Drought is a sure sign of a pervasive cloud cover without rain. The early European Bronze Age north of the Alps came to an end.

[Image: the god Sharruma guiding his steward king Tudhaliya. The king has a kalmush in his left hand, the sign of sovereignty. Sharruma's pointed cap is adorned with god-ideograms. -- Rock carving at Yazilikaya, Turkey. Hittite, 1250 BC. After uned.es.]

Tribes and peoples migrated to find better places to live. The Middle Kingdom of Egypt came to an end (probably soon after 1492 BC) when the Hyksos (the Amalekites met by the Israelites during their exodus) invaded from Arabia and held the delta for two hundred years or more, disrupting the political unity of Lower Egypt and ending the far-flung trade on which Egypt had depended during the period of the Middle Kingdom. The Hyksos established two dynasties in the delta. They established fortifications in Southern Palestine, as at Avaris, from where they regularly raided Upper Egypt and the Levant as far north as Syria. Others have suggested that it was the Mitanni or Philistines who controlled the Hyksos. [\[note 20\]](#)

Under the Hyksos, a new calendar was introduced in Egypt. In Mesoamerica, the Olmec culture initiated a 360-day calendar by setting up 18 months of 20 days. It was, in fact, the first rational calendar, but was used simultaneously with the older 260-day calendar of 13

periods of 20 days. Moses was given a new calendar by Yahweh. The orbit of Earth had changed.

The Messenger God

When Jupiter lost its coma in 2150 BC, the last of the older Gods had been removed from the vicinity of Earth. Only the dragon -- Venus or Quetzalcoatl -- still followed an eccentric path through the skies, closing in on Earth's orbit at 50-year intervals. And Mercury (as well as Mars, although less visible) was still seen scurrying back and forth across the skies on errands for the distant Gods and in the administration of humans.

The planet Mercury was now the most active remaining celestial body. Mercury had a coma and tail which lit up; Mars did not. Mercury becomes identified as the emissary and messenger of the older Gods and was named Thoth (Egypt), Enki (Mesopotamia), Hermes (Greece, initially known as Apollo), and Mercury (Roman, but at a much later date). He became the special caretaker of humans, providing all the gifts of civilization and controlling the fate of humanity. In Egypt, Mesopotamia, and Greece, he is the God with the arcane knowledge of writing, music, mathematics, and magic. Thoth, and the others, represented those faculties which seemed unnatural to humans -- those which were not held by the Ka of the Egyptians. These faculties included the knowledge of spells and magic, and were responsible for the expansive application of writing and measurement after about 2100 BC.

Eventually the messenger God would be woven into earlier tales and even held as a creator God. The details of his assigned tasks, like the names of the messenger, vary widely, but they have a similar characteristic everywhere. They do not have power; they have cunning.

[\[note 21\]](#)

After the previous electric contact with Venus, in 2193 BC, the static electricity of the atmosphere had probably steadily decreased, as it also had after 3100 BC. But the remaining atmospheric static electricity was still likely to show up just about anywhere: on mountains, pyramids, the tops of columns, and the horns of cattle -- as if it were delivering messages from the far-away Gods.

"Everything was in flames, the sky with lightning, the water with luminous particles, and even the very masts were painted with a blue flame."

-- Charles Darwin, writing about the voyage on the Beagle, circa 1856.

The blue flame experienced by Darwin was Saint Elmo's fire, a plasma exchange at glow level, which I have made note of in a previous chapter. It has been experienced since antiquity, especially by sailors, but today it occurs less frequently, and only under circumstances of impending electric storms at sea. The glow will show on ship masts, church steeples, and airplane wings. Saint Elmo's fire is a plasma flow between the crust of the Earth

and the ionosphere. The plasma stream, which is normally at a low density and in "dark mode," will be concentrated to higher densities and "glow mode" by pointed objects which are electric conductors. The result is as eerie as it is spectacular. [\[note 22\]](#)

Shortly before 1500 BC, the atmospheric electric charge, which had declined for 700 years since the last contact with Venus, increased again as the plasmasphere tail of Venus swept past the Earth and possibly touched at intervals a few years apart. The Egyptian magicians noticed. Moses noticed. You could tell from the environment. Something was coming. [\[note 23\]](#)

Moses and Yahweh

In the Sinai desert, Moses sees God in a flaming bush. Specifically, a thorn bush. This is important, for he notes how Saint Elmo's fire issues from the thorns and how it assembles itself into a dense core where the thorns point together. He will construct the Ark of the Covenant in a similar form -- two gilded angels on a box with their wing tips covering the Ark and nearly touching, which will be the seat for Yahweh. Yahweh is one of the gods associated with the play of electricity, but he is no messenger. He is a God in his own right. "Who are you?" asks Moses, addressing the flaming bush. "I am who am," Yahweh answers. Another reading of the Bible text is, "I am who comes."

Plutarch says Athena (Venus) means, "I come from myself." Cicero states Venus is so named because, "she comes to all things." The *Vulgate Bible* translates "Yahweh" as "He who is," although "He who casts down" might be a better translation. The equivalence of the names is not a coincidence, for it was the approach of Venus which generated the electric conditions resulting in the display of Yahweh. [\[note 24\]](#)

Alfred de Grazia adds "God fights," as a variation on "Downcaster" for the name of Yahweh. The Israelites were, in fact, the most ferociously belligerent nation to enter the Middle East before the Assyrians rose to power a third time. They were an army forged in the Sinai Peninsula under the tyranny of Moses and his God Yahweh. They took the Ark of the Covenant into battle as a secret weapon, terrifying their enemies. The slaughter was enormous. Many centuries later, the Philistines capture the Ark. After moving it to three different cities, they beg the Israelites to take it back. It was uncontrollable and those who approached it became ill.

The *Book of Exodus*, as an account of these events, is not to be dismissed and needs to be read with an open mind. Take Alfred de Grazia as a guide.

"There myth is cozy with history. And the combination has been fiercely, obsessively retained, as if a purely historical recollection would be unbearably painful. Although the second of the five Books of Moses, the Exodus, is the best account that we have of that year, its most ancient lines were written down under stressful circumstances; to these

lines, perhaps of Moses himself, a full oral tradition was added in the course of several centuries. The materials were sometimes lost; they were copied, rewritten, amended, translated and retranslated, time and time again."

-- Alfred de Grazia

I am indebted to Alfred de Grazia's *God's Fire* (1983) for what I will summarize in a few paragraphs. First off, to dispel a few inaccuracies: [\[note 25\]](#)

- Moses is a member of the court, probably the pharaoh's adopted brother. This is supported by the story of his birth and upbringing. Pharaohic succession was matriarchal, including by adoption. Nothing else explains the ready access of Moses to the court. As a member of the elite, he was fully Egyptian and, although nursed by his biological mother, he was raised as the adopted son of an Egyptian princess. [\[note 26\]](#)
- Moses spent a decade in exile in the Sinai peninsula (he had killed a member of the court), married into a local Midianite tribe of herdsman, and tended flocks. As an exile, he received insights into other gods (the people outside Egypt had, of course, different Gods) and learned from the smiths of the Egyptian copper mines of the Sinai. As a court member, he read, he wrote, he knew materials, and he performed magic.
- The Jews were not slaves, except in the sense that all citizens of a nation were slaves of the Gods. When they leave Egypt, they carry swords and other arms. Within the first month in Sinai, they spend a day fighting a rear-guard action against the Amalekites (Hyksos). Arms are not the hallmark of slaves.
- What Moses and his spokesperson, Aaron, sought of the Pharaoh was an "exit permit." The population of Israelites were an economic force and would have been pursued if they had just decided to leave Egypt *en masse* and without permission. Of course, at the last moment, the Pharaoh changed his mind and did pursue them.
- The exodus was well planned and organized. The Israelites left with the body of Joseph, and with their herds and ox-drawn carts and plenty of materials: provisions, tents, metals, forges, and lumber. They left with a mixed multitude of other squatter nationals and disaffected Egyptians. And they left with the Levites -- a cadre of Hebrew-Egyptian scribes, bureaucrats, and administrators, who would be assigned as the priests of Yahweh and the camp police.
- The passage through the standing waters was not through the Red Sea (the "Sea of Reeds"), but past the string of lakes between the Red Sea and the Mediterranean, between today's cities of Suez and Port Said. They were headed towards the Sinai Peninsula from the eastern margins of the delta because the way to Gaza was patrolled by Egyptian troops, whereas the route south to the Sinai was not. [\[note 27\]](#)

The Sea of Reeds

The wall of standing waters was indeed from the Red Sea and the lakes, but it stood on the land outside of the sea and the lakes. "The waters that confronted the Israelites were

unexpected," writes de Grazia.

Before continuing with the physical aspects of Exodus, let me present the following:

Velikovsky, and thus de Grazia, followed the traditional notion that the crossing happened at Lake Sirbonis, or a similar location. James Hoffmeier, in *Israel in Egypt* (1997), presents various theories for a crossing of the "Red Sea," including the Gulf of Aqaba.

The derivation of the name "Red Sea" is very uncertain. There are no "red" aspects associated with the waters. The name for the Red Sea in Hebrew is "Yam Suph" which is translated as the Sea of Reeds. Velikovsky, however, offers:

"But the name of the Sea of the Passage -- Jam Suf -- is derived not from 'reed,' but from 'hurricane,' *suf, sufa* in Hebrew. In Egyptian the Red Sea is called *shari*, which signifies the sea of percussion (*mare percussio*) or the sea of the stroke or of the disaster."

In line with the lack of evidence for an exodus, it might be noted that we are presented with the following image: "the Lord divided the sea with a wall on one side and on the other as well," plus, following the passage through the gap in the water, the Israelites camp "before the mountain of God."

This exactly recalls the event of 2349 BC, when the Absu -- the sea of reeds -- parted at the time of the fall equinox, followed by the appearance of Jupiter on his mountain, "the mountain of God." The "Sea of Reeds" is, of course, the Absu or Duat, referred to as filled with reeds in Egypt. In 2349 BC, during the most fearful period that humanity ever lived through, the Sea of Reeds turned red. Perhaps a rare coincidence, but such details added to Exodus, which obviously is a conglomeration of sources (as de Grazia also admits), point this particular text to legendary status.

The Quiche Maya will record in the *Popol Vuh* a similar passage through a gap in the sea: "a place called Great Hallow" and a mountain "called Place of Advice." Reading from their original sources, the 16th century AD transcribers write:

"Sandbanks was their name for the place where they crossed through the midst of the sea. Where the waters were divided, they crossed over."

-- *Popol Vuh* translated by Dennis Tedlock (1996)

As narrated in Genesis: The arc of Venus moved the water into position to block the fleeing Israelites, then moved it aside for passage, only to have it fall back just as the Pharaoh and his army closed in. Exodus records that the pillar of fire stood before Israel, then moved behind them (to the west). The physical description of the changes in the winds, the movement of the water, and the movement of the pillar support the concept of an electric arc traveling west across the Sinai and part of the Nile delta.

The timing as recorded in Exodus may or may not be correct. It was just sheer luck, but a most monumental event, which would be played back to the Israelites by Moses for years, even though (Jewish legends have it) a hundred thousand Israelites also perished in the collapse of the standing waters, fictional or real.

"Then the Angel of God who went before the host of Israel moved and went behind them; and the pillar of cloud moved from before them and stood behind them, coming between the host of Egypt and the host of Israel. And there was the cloud and the darkness; and the night passed without one coming near the other all night." -- Exodus

The delay ("the night passed") is difficult to allow physically if this were an extra-terrestrial arc traveling west with a rotation of the Earth. And this certainly would not have happened at night. The arc from Venus could only happen during daytime. It is possible that the day had extended into the night hours, as a number of nations recall. This would be due to the gyroscopic reaction torque twisting the axis of the Earth in a circle to compensate for the initial shock from Venus. China complained of the Sun not setting for some 5 or 10 days.

It is interesting to consider where the axis of the torque of the gyroscopic reaction might have intersected the Earth's surface. This had to be near the equator to be at right angle to the rotational axis. Five days of sunlight in China can only mean that the Earth had tilted over so far that the North Pole faced the Sun. As the Earth rotated, large portions the northern hemisphere, including China, would have remained in daylight.

The Exodus narrative claims the arc appeared near northern Egypt and to have come to a standstill. This could have happened as the rotational axis of Earth started to move to an upright position again. It would have to be daylight, however, and the region would have faced the Sun in order to experience the arc. The arc could have been located in the Mediterranean, for a continuous arc on land would have bored gigantic holes, and been very destructive. Placing the arc in the Mediterranean also suggests the spectacle of water standing up to the heavens, except that it would have been steam rising thousands of miles up, not water. Except for the drowning of the Pharaoh's troops, there is no notice of a flood of cascading water.

So, despite what Exodus claims, it was daytime in Egypt when the arc appeared. The darkness may have been from dust electrically removed from the surface and whipped up by the tornado winds surrounding the arc, to be levitated electrically by the magnetic field surrounding the arc. Tornadoes operate exactly in this manner. But the length of days and night were in disorder, as Iranian myths also claim (notes Velikovsky).

We are thus presented with the spectacle in the Bible, probably with more drama than might be called for. The reported location of the arc could likely have been five hundred miles (800 km) "before" or "behind" but would still have been seen. But at one point it was "in between" the Israelites and the Egyptians. The arc is thus reported to have passed right between the two troops. What a frightful sight that would have been. De Grazia writes:

"Moses could hardly have imagined the horrible immensity of the natural catastrophe. A legend recites that the plague of hail in Egypt had [also] brought great famine to Jethro's Midianites [in the Sinai]. Upon arriving in his 'promised land' [Moses had not originally meant to move to the Sinai] there was little left there but parched earth, dry water holes, flaming mountains, and, Thank God, Yahweh. By now Moses and the leaders must have known that they could go nowhere until they were in better shape all-around and the natural forces had become subdued."

"By that time, Moses must have been as fanatically possessed as any man could be, insane with the problems of a people clinging only to hope and staring wild-eyed and worshipfully at alternative hopes. Whatever he did had to be quite mad. But what he did was rational unto the occasion. He insisted upon his obsessions. He exercised his talents, and those of the Levites and Aaron, and all the capabilities of his instruments."

"He worked Yahweh, the Lord, furiously, wrenching from this Great Father Figure concession after concession, arrangement after arrangement, law upon law, giving up in the end only his right to cross the Jordan River into the Promised Land [Canaan]."

-- Alfred de Grazia

In the Desert

The actual crossing of the "sea of reeds" has been disputed endlessly by scholars and bible exegetes. It doesn't really matter if nearly all of this sea-crossing description in Exodus was taken from the event of 2349 BC. It probably has little bearing on the overall narrative which is about a people escaping from the servitude of one religious observance and adopting a new and more consistent alternative.

With the previous electric contact by Venus in 2193 BC, the atmosphere had been heavily charged with electricity, although steadily decreasing over time. All along priests had been taking advantage of the atmospheric electric charge as a sign of the presence and favor of the Gods. This was a real phenomenon. Recall that Abraham in his sacrifice of a ram discovered he had no way to light his fire, but God ignited the kindling for him. This practice dates far back into remote antiquity, although all we have are more recent descriptions which only hint at the fact that offerings on altars on high places would ignite themselves.

Aurochs horns had traditionally been used at altars to ignite the flame with electric arcing. But this is the Bronze Age and altars were now clad in bronze with bronze horns. This material conducted much better than cattle horns on stone platforms and overcame the mounting deficiency in the atmospheric electric charge.

After completing the Ark, the Israelites build an altar for offerings. It is made of wood sheathed in thin bronze, with bronze horns at the four corners, facing in towards each other.

Yahweh provides the plans. Moses asks Yahweh, "Will it not melt?" There was difficulty getting it to light, but once a spark generated between the horns it stayed lit for over 100 years.

The *Midrashim* records that, when the building of the Ark was completed, the sky stopped moving. The contact with Venus had disturbed the axis of the Earth, causing the spin axis of Earth to sweep through a loop. The sky came to a complete rest a year and a month after the Israelites passed through the Red Sea (Ussher).

The Moving Sky

The "moving sky" relates only to how the dome of the stars was seen with respect to the horizon. Or it could have been determined by where the Sun rose and set -- one has to assume that even with a heavy overcast, at least the Sun was noticed.

The movement of the stars, on the other hand, would change only as the result of a change in the inclination of the axis of rotation to the orbit of Earth. No other change will make the stars look like they have moved (except, of course, the daily rotation of the Earth). Because of the immense distances to the stars, the stars will look the same no matter what orbit Earth takes around the Sun. It is possible, although unlikely, that the Earth's rotational axis kept up its corrective gyroscopic maneuver for a year and a month.

The repulsive impact was close to the equator, and resulted in the largest displacement of Earth that we have a record of. Venus was half as far away as in 2349 BC, which would have doubled the force of the impact. But the gyroscopic reaction torque was much slighter than usual, moving the arc contact up only 30 degrees in latitude and 180 degrees in longitude (from mid-Pacific to Egypt), in the time span of a half rotation of the Earth.

However, a number of anomalous circumstances might be explained if we assume that the gyroscopic reaction torque completely or almost completely inverted the Earth. Then it might take a considerable amount of time to rectify the location of the rotational axis of the Earth in space. But this was not likely to have happened. It only appeared to be such. We can blame the lack of light and the change in climate for people to have reached this conclusion.

One of the anomalies was the reports that winter followed spring, which would be true for an inversion, but also if the correction took a year. But an extensive cloud cover, and the relocation of the Earth to 30 percent more distant from the Sun would certainly result in the same impression.

The numerous citations by Velikovsky of the interchange of north and south, and especially east and west, in the support of an inversion of Earth, simply do not apply to whatever might actually have happened in 1492 BC. I have quoted many of these in the Appendix "Polar Relocations Disputed," with comments added to explain all of them. We are generally dealing

either with exaggerations of a catastrophic condition, or a complete misreading of statements from the more remote past, like the following from *Worlds in Collision*:

The *Ipuwer* manuscript reads, "The land turned over like a potter's wheel."

But that makes no sense. Potter wheels do not turn over, and the quotation was altered by Velikovsky to include the word "over." Velikovsky also quotes a pyramid text as "*the luminary [Velikovsky's words] ceased to live in the occident, and shines, a new one, in the orient.*" The pyramid texts date to after 2350 BC, so this is not concerned with the period of the Exodus. The text, in fact, describes the changes in 3147 BC -- typical of Egyptian spells, this is not a narrative concerned with the event of 2349 BC, only the remembered event from the remote past. The "new one" here is Jupiter, which rose in the east, replacing Saturn which had stood in the northwest, and brightened at nightfall in the northwest before traveling east below the polestar.

The extensive cloud cover is still a concern, for the notice of a generation "growing up in darkness" or the Bible complaint about "walking in the shadow of death," would presume that the stars could not be seen. However, the Sun and Moon might certainly be seen, and these would only indicate that the sky was moving in unexpected ways.

In any case, it could not be guaranteed that the Earth would return to its original inclination. Thus it is likely that the 30 degree inclination of the rotational axis dates from this event. My earlier suggestion in the Chapter "Pyramids and Henges" is that the Earth's initial axial inclination was 25.2 degrees.

Gyroscopic reactions are relatively gentle. Even an inversion would not be noticed by humans, except for the relocation of the Sun and Moon in the sky (and climatic changes), and no landmasses would be subjected to earthquakes or even tremors -- only those which absorbed the initial external impulse force. All the talk by any number of catastrophists (besides Warlow, de Grazia comes to mind) about splashing oceans, tsunamis, and crashing mountains is largely imagined. [\[note 28\]](#)

The Ark of Yahweh

Alfred de Grazia gives the following explanation of how the Ark worked, although he has it wrong:

"The ground ark, unlike the pyramid or mountain altar, makes its own divine fire. It does not depend upon a single point high up to provide the electrical discharge. In a small machine, grounded by one pole and pointed to the sky at the opposing pole, the two being insulated from each other, an opposing charge is accumulated at the poles and, when sufficiently charged, the poles exchange a spark, a light, a divine fire. Unlike the pyramid, or mountain, the Ark can be moved to where its sources of strength are

greatest and its effects can be most affective for psychological or other purposes."

-- Alfred de Grazia

However, the Ark operated as a device using static electricity, not as an electric circuit. There is no need to electrically isolate the two cherubim. They will arc between their wing tips even if electrically connected. Rather than using stone and an extremely high location, the Ark would have displayed Saint Elmo's fire because it was made of metal and set on a clear flat space. The Ark depended on being a highly conductive object set on a grounded flat plane and thus, in effect, a lightning arrester. When the ground was soaked with water, the minerals in the ground would turn the surrounding area into a conducting surface. When transported at a later date from Shiloh to Jerusalem, the Ark was temporarily located on a "threshing floor" to keep it operational. It was a matter of finding a location where the ground was flat and conductive.

Moreover, it can be suggested from the construction details that, in effect, the Ark was a Leyden jar, a large capacitor, which means that it could store enormous electric charges (at a potential of 10,000 or more volts). Not just a Leyden jar, but more like a *Van de Graaff* generator. A *Van de Graaff* generator is generally constructed as a metal sphere, where a trickle of static electric charges is introduced to the interior through an opening. The delivered charge accumulates at the interior of the sphere. This induces a charge of opposite polarity on the exterior, allowing the delivered charges to be continuously accepted. A *Van de Graaff* generator is able to hold large charges at very high voltages.

When current, in the form of Saint Elmo's fire, passed through the exterior of the Ark, an opposite charge would accumulate on the gold-plated interior of the box. This would build up a nearly unlimited interior charge which would make the exterior even more positively charged. In this manner the Ark must have attracted an unusual amount of static electricity as a stream of plasma from the upper atmosphere. Yahweh showed himself at the intersection of the wingtips of the hovering cherubim, sparking and hissing his name -- "Yahweh, Yahweh, Yahweh." [\[note 29\]](#)

The continuous arc would have generated ultraviolet radiation. There are many reported cases of UV burns, including Moses. The arc would also generate X-rays. The Ark was kept in an unroofed double tent, a curtained enclosure -- the Tabernacle. Yahweh could not be casually looked at. The attending priests shaved themselves and wore protective garments and face masks, "lest they die." A number of persons were electrocuted by touching the Ark, some accidentally and some on purpose. Both of Aaron's sons died by electrocution. De Grazia suggests that part of Moses's additional "magic" displays may have consisted of chemical censers used near the Ark, specifically sulfur and phosphorus, which could also lead to chemical burns. [\[note 30\]](#)

The Ark was often carried far ahead of the people in the desert. At night a visible stream of light would rise like a beacon from the Ark. During the day it would look like a diffuse cloud

column. This was the column which went before the Israelites day and night. It was a function of the exceedingly high atmospheric electric charge, as might be expected since the Earth had received a recent electric discharge from Venus.

The pillar of fire at night was a visible column of plasma at glow level (not at arc level) connecting the ground plane to the upper atmosphere via the two angels on top of the Ark. During the day this would look more like a column of smoke -- an effect which may have been augmented by the censers of the Tabernacle. The smoke would ionize and outline the plasma, even at dark mode level. Only at the wing tips of the angels was the flow of electricity concentrated enough to go into arc mode. The Israelites followed a forty-year path of connected conductive regions in their wanderings. Rest periods would result when the humidity lowered and the column disappeared (and when cattle and sheep needed grazing). The column would reappear when the overhead conditions changed. (Further below I will suggest another source for the image of a column of light and smoke.) [\[note 31\]](#)

Other nations might very well not have noticed that, under these new conditions, a simple metal box with up-pointed spikes set on a grounded plane would do what in previous years had required tall stone structures. As a weapon of war, the Ark would have been seen by the enemy as the approach of the God of the Israelites -- frightening the inhabitants of besieged cities and the troops of opposing armies. The visible acts of Gods were undisputed in antiquity.

When the Ark was moved to the temple at Jerusalem in 900 BC, after having been outside in a tent on the plain of Shiloh for 512 years, the displays of static electricity had declined noticeably. The electric display may have started to falter. Josephus says the electric fire stopped in the first century BC -- after 1400 years.

The Psychosis of Yahweh

De Grazia dismisses the concepts of a developing subjective consciousness suggested by Julian Jaynes. De Grazia writes, "Jaynes was not able to cope with the historical materials, largely because he relied upon conventional chronology." De Grazia dismisses the whole concept of the bicameral mind. As he states:

"In reality it was the catastrophes of the world whose terrible stresses made hallucinatory leaders out of borderline cases and staunch believers out of normal people."

-- Alfred de Grazia [\[note 32\]](#)

This serves to support de Grazia's extensive analysis of the politics of the exodus and the psychology of Moses. But as Jaynes had warned, de Grazia is unable to distinguish a bicameral mind from a fully functional human and de Grazia's description of Yahweh reads almost exactly like a bicameral Moses. Yahweh *is* Moses, but as the separate right hemisphere of his mind. In effect Moses had a split personality. This is, in fact, how Jaynes defines the bicamerality of the mind -- the independence of the right hemisphere which can guide the verbal left hemisphere and which, in earlier times, would order the other half around verbally. Even today the right hemisphere imposes itself completely on schizophrenic individuals. The rest of us, having learned to silence the voices, still frequently hear the right hemisphere as the unvoiced utterings of *oughts* and *shoulds* -- "close the door," "turn off the light," "do you have your keys?" Moses, as a pre-conscious human, was guided in what he did by the right hemisphere of his mind and experienced this as a separate "being" who spoke to him.

When de Grazia writes, as above, "it was the catastrophes [which] made hallucinatory leaders out of borderline cases," he is entirely correct in that the events of the period were certainly stressful, but those are also the conditions which foster subjective consciousness. Jaynes has noted (without any reference to worldwide catastrophes) that this period saw the first light of subjective consciousness in individuals, first in bemoaning the failing presence of the Gods and their guidance, and then as a reaction to the press of strangers. These were only two facets in the series of unpredictable events and novel conditions which changed us as humans. The only "evolutionary" solution was to engender the ability to imagine what might happen in these new situations.

Moses certainly had the imagination and ability to organize the exodus from Egypt of a large group of people and keep it organized under exceedingly difficult conditions. (Josephus claimed, in the first century AD, that Moses had previously led a military expedition to Ethiopia.) The only thing that he failed to imagine, much later, was the actual entry into Canaan and the whole new set of problems and conditions to be dealt with in the conquest

and settlement of this new land. Forty years earlier the voice of Yahweh had driven him; by the time he reached Canaan, Yahweh had gone silent. Moses dawdled endlessly, and eventually it cost him his life. [\[note 33\]](#)

Allow me to quote from de Grazia extensively, for his source document, the second book of Exodus, is important. The writing in Exodus is personal without being self-serving, and is a rare window on an age which changed humanity. The nexus of catastrophe and the human mind, desperately seeking to resolve the unpredictable, is key to understanding how we, within the next thousand years, became fully human -- that is, how we evolved subjective consciousness and started teaching this to our children, silencing the demanding and controlling right hemisphere, and, most importantly, how we came to rely upon the imagined spaces of consciousness in the left hemisphere to help us live in the changing world.

"The abrupt commands of Yahweh, his great noises, curses, and marvelously clear consultative advice enrich the verses of the Books of Moses. The lack of explanation is typical of both hallucinatory voices and of Yahweh's words."

"Yahweh says and Yahweh does. What he says consists of describing himself, expressing his emotions, relating what he has done, instructing as to what must be done, and foretelling what he will do."

"All that Yahweh says is in an absolutely authoritative mode. This includes those expressions which comment upon behavior that is against his will or interests."

"What Yahweh does, supplementing what he says, is to cause all things to happen, even expressions of disobedience coming out of 'free will,' in the sense that if he wished to do so, he could make people will what he wanted them to will."

"He even asserts a power to be bad, to do evil. He is not bound by notions of good or evil. 'Who makes peace and creates evil, I Yahweh do all this.'"

These observations by de Grazia are completely archetypal and descriptive of the right hemisphere of the brain, and you will recognize them instantly if you are familiar with Jaynes's research on schizophrenia, hypnosis, talking in tongues, complex automatic activities, and the narratives of antiquity.

"Yahweh writes; he organizes lists or rules; he keeps books; and little else that is technical; he is the product, not the fountainhead of the science of Moses."

"Write this in your book," Yahweh commands Moses. The organization of lists and rules is also archetypal of schizophrenia, but the phrase "little else that is technical" is not quite fair. Typical of a right hemispherical presence -- the hallucinating voice -- Yahweh is quite accomplished technically. He explains to Moses the new calendar. Moses has to return to Yahweh with questions, for he does not understand. It is Yahweh who designs the Ark, and

sets all the safety requirements for the attending priests, their clothes, the procedures, the curtained tents, and all the altar appurtenances.

However, it is certainly correct to say that Yahweh was "the product of the science of Moses." As with us, the right hemisphere of Moses's brain had access to all that he had learned, and as with us, the right hemisphere could draw together physical concepts and synthesize disparate parts into a working whole -- in short, solve problems -- and then deliver the solutions to the conscious left hemisphere, as if out of thin air. And Yahweh is quite well aware of what problems Moses is capable of solving without help. At one point Yahweh demands an Ark design with red, blue, black, and white fire. Moses asks how this might be done, and Yahweh, in a fashion absolutely typical of the annoyance often displayed by the right hemisphere today, answers, "I fabricate my glory; you make your own colors."

De Grazia took this anecdote from a secondary source which quoted some Midrash tradition. The Midrash is the collected Jewish commentary on the Bible, originally oral, but reduced to writing after the second century AD. It thus constitutes a comment some 1600 years after the Exodus.

The colors, except for blue, are the same directional colors as will be found in the Maya *Chilam Balam*, which suggest that these are the four fires of the cardinal directions, "the four ancient khu's who dwell in the hair of Horus," or, as the *Chilam Balam* has it, the four directional trees. As I have already suggested in previous chapters, these are likely to be the polar plasma plumes in the north and south, and the edges of Van Allen belts in the east and the west.

The colors here match the colors of the trees of the cardinal directions described by the Maya, except that blue is substituted for the Maya's yellow of the south. (I am assuming that the order of the colors follows the rotation among the compass points.) The assignment of colors to compass points also occurs in China, in Central Asia, and among North American and Central American tribes. No two sets of colors are assigned to cardinal points the same way, however.

As Jaynes points out, it is a transitional period. The attendant visual hallucinations have disappeared -- God no longer strolls with Adam in the cool of the evening. Yahweh has become a disembodied voice. Only one time does Moses speak face to face with Yahweh. Fifty years later Joshua is spoken at, rather than spoken to by Yahweh. "At times Joshua is so uncertain he has to cast lots." [\[note 34\]](#)

The Third Return of the Axis Mundi

As the Earth increased its orbit in 1492 BC, it would again have to adjust its electric charge to its new location. Again the *axis mundi* appeared in the north and in the south. Peculiar to the south was the fact that in 2349 BC the polar plume had risen directly (or nearly so) out of

the gap in the Absu, standing next to the blazing image of Jupiter. I detailed this resurrection of Jupiter in a previous chapter. In the narrative of Exodus this imagery is understood as Moses holding up his staff to keep the waters of the Red Sea parted. (This is the shepherd's crook of the pharaohs also.)

About the northern polar plasma plume, Milton Zysman suggested in 1994 (at a Velikovsky Symposium), that the pillar followed by the Israelites for 40 years was an extended aurora. He wrote, about Velikovsky's developing causal theory:

"Since meteoric showers, great and small, are understood to be debris entrained by comets, Velikovsky took the next logical step by gleaning the Bible and associated Talmudic sources for evidence of a comet during Exodus and Joshua."

"It was then that the 'mysterious pillar' became the tail of the protoplanet Venus."

So claims Zysman, and continues, quoting Velikovsky:

"Because of the proximity of the Earth, the comet left its own orbit and for a while followed the orbit of the Earth. The great ball of the comet retreated, then again approached the Earth, shrouded in a dark column of gases which looked like a pillar of smoke during the day and of fire by night and the Earth once more passed through the atmosphere of the comet, this time at its neck."

Zysman commented on this as follows:

"It has been for some time this author's opinion that this 'mysterious pillar' is not a comet's tail, but the Earth's north and south magnetic poles illuminated by the joint action of electric discharge and the commingling of Earthly and cometary gases. In other words, a giant aurora."

A plume of plasma in glow mode at the magnetic poles would be a much more likely candidate. Auroras don't behave like polar pillars. I have already described the polar plume as extending 20 Earth diameters up into the plasmasphere (160,000 miles, 260,000 km), and thus visible from anywhere on Earth. Auroras do not extend more than 300 miles (500 km) above the surface of the Earth and do not assume the shape of pillars. The coloration of auroras is limited to the atmosphere and stratosphere, where Oxygen and Nitrogen are encountered. Zysman is correct, however, in locating this at the magnetic pole.

The pillar shows up in the mythology and legends of many people, although with some sparsity, for the column did not do anything. It was just there. The suggestion, today, that these recollected columns only refer to the Saturnian planetary polar configuration from prior to 3147 BC is an error, for the polar columns were seen again and again in antiquity. Only the terse history of the world recalled in the Maya *Chilam Balam* books is specific about how many times that occurred. The four trees which hold up the sky, and are said to

commemorate the previous destructions of the world, appear three times, after 3147 BC, after 2349 BC, and after 1492 BC, each time after the massive "destruction of the world." The "destructions," as listed by the *Chilam Balam*, can be dated to match information from the Eastern Mediterranean region. (As mentioned earlier, ballcourt markers from Copan suggest nine appearances of the northern plume, seven for the southern plume.)

In addition, the *Chilam Balam*, in its severely abbreviated history of the world, categorizes the event of 1492 BC, from the translation by Ralph L. Roys, as follows:

"But it was (over) the whole world that Ah Uuc Cheknal [he who fertilizes the maize seven times] was set up. He came from the seventh stratum of the earth, when he came to fecundate Itzam-kab-ain, [the Earth] when he came with the vitality of the angle between earth (and) heaven."

Roys suggests another translation of the last line ("when he came ...") which reads, "then he descended while the heavens rubbed against the earth." This looks like the sixth appearance of the "Celestial Cow" -- with the Van Allen belts in glow mode.

During Moses's 40-day absence, while he was communing with God on the Mountain of the Law Giving, Aaron manufactured the Golden Calf idol for the impatient Israelites. *"Here are thy gods, Israel, the gods that rescued thee from the land of Egypt"* -- Exodus 32:4. ("Elohim" for "gods".) The calf did not last long, for when Moses returned from the mountain, he destroyed the Golden Calf. This may be an indication of how long the Celestial Cow stood in the skies after first appearing sometime after 1492 BC.

The Golden Calf, as the Hathor Cow, was an Egyptian false Goddess to Moses. Which may also be why it did not last very long. When Moses came down from the Mountain, he carried the Ten Commandments, all the laws, and all the design details of the Ark of the Covenant which was to be the seat of the God of Israel. He destroyed the Golden Calf.

In the third year after leaving Egypt, God orders Moses to create a brass serpent mounted on a pole -- as a medical device to be used to cure snakebites. This brass snake lasted 800 hundred years. Hezekiah finally destroyed it after 700 BC. [\[note 35\]](#)

Of all likely possibilities, the snake as representing the north polar plume seems most likely. Inadvertent research by NASA have discovered the polar plumes to consist of dual (entwined) plasma columns. We can suggest from the three-year delay, that this hints at how long the polar plasma plumes may have lasted.

Zysman suggests that the "column" which lighted the night and marked the north for Israel during wanderings in the wilderness, was important enough to have been additionally venerated in the temple of Jerusalem 500 years later. He writes:

"It may have evaded the scrutiny of even the most assiduous Velikovskians that there is

very little direct evidence for the appearance of a comet during both the Exodus and the Joshua stories. All the indicators of a great meteoric shower are in place and it can be argued that any well-informed tribal leader or court magician would have little trouble inferring its involvement, yet we have no specific mention of a comet being observed before or during the event."

Let me comment on that.

There is specific mention of a "comet," but only by those people who saw the display. Most of the world saw nothing, apparently even India, where the arc may have traveled partway through the Indian Ocean and produced vast amounts of steam and water vapor. The Greeks, not directly affected by the arc or needing to worry about their own survival, saw Typhon. (On the other hand, the later strike at the time of Joshua could have landed anywhere on Earth to produce the catapulted rocks and bolides.)

I doubt very much if this was an asteroid shower so extreme that people throughout the regions migrated *en masse* for that reason -- the Greeks (Ionians), Dorians, Phrygians, Carians, Lycians in the Eastern Mediterranean, the Mitanni, Hyksos, Hebrews, Kassites, Persians, in the Near East, and the Central Asiatics into Pakistan, India, and regions north of the Himalayas. What were all these people fleeing from? Ice cubes and snowballs falling from the sky? Such a shower never returned, yet the migrations continued for hundreds of years.

Primarily they were all attempting to escape from the dreadful climate which followed on 1492 BC. Over the next hundred years the grass of the steppes turned brown, the central lakes of Asia dried up and turned into deserts. They headed for what they knew to be the fruitful agricultural lands of the civilized nations which were largely unprotected. Joshua did the same.

Joshua and Jericho

As the cloud cover starts to lift, and after forty years of wandering with their herds throughout Arabia, the Israelites started the invasion of Canaan from the east. They crossed the Jordan on a dry bed, for an earthquake had just blocked the river with a fallen bank. It was seen as a display of the favor of their God. During this period earthquakes still occurred frequently.

The walls of Jericho also fell because of an earthquake. The Israelites had walked the Ark of the Covenant around the city for seven days. When the Ark lit up in response to the subsurface piezoelectric effects generated before the earthquake, they knew that the walls of Jericho would fall and the Israelites blew their trumpets as the shifting Earth also started to squeal. [\[note 36\]](#)

The Israelites proceeded with the invasion of Canaan, a war which would take 14 years. Near the end, in about the 12th year, Joshua orders the Sun to stand still in the heavens for the span of a day to allow completion of a battle. During the same battle stones fell from heaven.

"And the Lord cast down great stones from heaven upon [the Canaanites]; they were more which died from hail stones than they whom the children of Israel slew with the sword."

-- Joshua 10:11

This happened, it is estimated, in 1440 BC, 50 or 52 years after the exodus, and is the second time in this era that Venus made electric contact with Earth and exchanged a plasma discharge. We do not know where the strike connected to Earth. Explosively launched rocks from an arc striking on land, rather than the sea, can travel immense distances and even be ejected from Earth. The "great stones from heaven" may have come from anywhere on Earth. [\[note 37\]](#)

Eva Danelius, in "Did Thutmose III Despoil the Temple in Jerusalem?" in *Journal of the SIS* (1977/78), also retells her experiences at Gibeon:

According to the [Septuagint] version "the Lord struck them (the Amorites) with a panic, on account of the children of Israel, and the Lord routed them, with a great slaughter, at Gibeon. And they [the Israelites] pursued them by the way of the ascent of Oronim, and smote them. .. And as they were fleeing from before Israel, at the descent of Oronim, the Lord poured a storm of hailstones from heaven upon them... so that there were more who died by the hailstones, than the children of Israel slew with the sword in battle."

Josephus, in about AD 100, adds "the discharge of thunderbolts and the descent of hail of more than ordinary magnitude."

The Pharaoh [Thutmose III] obviously spent the night at Beth Horon the Nether (today: Beith 'Ur et-Tachta), right at the entrance to the dangerous part of the defile, which is already in the mountains. The next morning, according to the Annals [at Karnak] (lines 58/9), "My majesty proceeded northward carrying my father Amon [lacuna] before me...."

Danelius adds:

This is the only instance I know of in Egyptian records where we are told that statues or images of the gods were carried into battle, as the Hebrews carried the ark.

What kind of fear had gripped the Pharaoh that he felt it necessary to take this precaution? Why did he take it here, and only here, once in a lifetime? The objective difficulties of the way ahead of the army were considerably less than those which had

confronted, and been overcome by, the Egyptian army in [Ethiopia], where mountains 10,000 feet (3000 meters) high rose sheer above narrow canyons filled by torrential streams.

Danielius had received a bolide of the type that apparently had fallen "at that time and place, according to the Biblical record" from H. H. Nininger, founder and director of the American Meteorite Museum.

She continues with:

When I showed the aerolite to the stonemasons working by the roadside at 'Ur et-Tachta (Beith Horon the Nether), they immediately recognised it: "Hajar min 'Allah!" ("A stone from Allah," i.e. from heaven), they exclaimed. According to them, the slope going down into the wadi, and the wadi itself "the going down to Beth-Horon" of the Bible, were full of stones like the one in my hand. The same answer I got from the teachers at the local schools.

Though this cannot be called conclusive, the amazing familiarity of the local Arabs with the phenomenon of meteorites seems to justify the conclusion that the Biblical story is based on reality. As Nininger [of the American Meteorite Museum] and other experts have abundantly proved, meteorite falls have been known and remembered for centuries among local populations, and more often than not considered intervention of the God(s) in human affairs. And here we meet with a second conception of those times: the understanding that there was a metaphysical connection between a God, His people, and His land.

Thutmose was not afraid of a human enemy but was reluctant to enter a road where "The God of the Land" had intervened, from heaven, to help His people; and Thutmose perfectly understood the motivation of his officers who preferred one of the other deities, and neither blamed them nor punished them, but let them choose. And this fear, too, explains why he had the standard of "his father Amon" carried before him: Amon was a meteorite god, able to protect his children from a calamity similar to that suffered by the five Amorite kings.

Velikovsky, who estimated the date of 1440 BC, had some problems bridging the gap between the exodus and the order by Joshua for the Sun to stand still, feeling the need to span 52 years, which is a figure he derived from Mesoamerican sources. Celebrations of the renewal of creation in Mesoamerica were based on 52 "Tun" years, which varied with the calendar in use. But after 1492 BC the actual period between apparent close "approaches" of Venus was 50 or 51 solar years. The actual event of Joshua thus occurred in 1442 BC (1492 less 50). Details are given in Appendix B, "Celestial Mechanics."

I suspect that the arc may have traveled through mainland Asia and towards Europe, and may have touched Mesoamerica. Part of the travel must again have been through oceans, for the

cloud cover again returned -- so say Mesoamerican sources. For a second time in quick succession, Mesoamerican culture suffered destruction. The Olmecs recognized the agent involved and took note of the interval since the previous catastrophe. The end of the world would now be expected every 52 Tun years on the Olmec calendar. A day was assigned in the 260-day Tzolkin calendar to correspond to a day in the new 360-day Haab calendar. This day combination would repeat only once every 52 calendar "years" and once every 52 years all of Mesoamerica trembled in fear awaiting sunrise or doom. In Mesoamerica the travels of Venus, as Quetzalcoatl, the feathered serpent, continued to be watched and recorded with great anxiety for the next 3000 years. Venus approached Earth numerous additional times during the coming centuries, but without striking. [\[note 38\]](#)

Abandoned by the Gods

It was a transitional period not only for the Israelites, who would continue to cling to their one God, but also for other peoples, who felt abandoned by their many Gods of old. Mercury seemed to have remained. Mars possibly was not seen since it had no magnetic field or atmosphere to support a coma. Mercury's duties (as Thoth of the Egyptians) were extended to include creation and guide for the dead.

The period after 1500 BC saw mass migrations of tribes in Southeastern Europe, Greece, Anatolia, Iran, and the Arabian peninsula. The volcano on the island of Thera in the Aegean explodes during this period, sending a tsunami 600 feet (200 meters) high towards the coast of Greece and Asia Minor. The harbors and quays of Crete, just south of Thera, sank below the level of the ocean.

As Jaynes suggested, this period also saw the first glimmer of subjective consciousness -- the effect of the widespread catastrophes, mass movement of peoples, and the loss of the familiar commands and admonitory voices of the Gods. It is also the start of our current religious beliefs. Like abandoned children, mankind took the blame for the leave-taking of the Gods and the silencing of the voices. Supplications to the Gods and pleadings for forgiveness first appear in extant documents at this time (that is, after 1200 BC), as do devils and evil spirits, and the search for significant omens. This attitude toward the Gods is conspicuously absent before this period. A superstition of spells and magic starts to envelop the Middle East.

[\[note 39\]](#)

In Mesoamerica, pleading with the Gods includes the periodic destruction of temples and monuments and their rebuilding or overbuilding. This starts after about 1300 BC by the Olmecs and continues into the era just prior to the arrival of the Spanish in AD 1500. We have to presume that the bloodletting, which so characterized Mexico at the time of the Spanish arrival, also had its genesis at this time, although I will suggest later that this probably started after 685 BC.

Fifteen hundred years earlier, mankind had been cast from Paradise but had been sustained

by the guiding voices of the Gods. As subjective consciousness bloomed in response to the catastrophes of 1500 BC, and especially to the disorder of wandering tribes, the voices disappeared. Laments for the loss of the personal Gods were added to the literature of the Middle East after 1300 and 1200 BC. They are echoed in the oldest book of the Bible, Job, as in the *Ludlul bel Nemegi*.

*My God has forsaken me and disappeared,
My Goddess has failed me and keeps a distance,
The good angel who walked beside me has departed.*

-- Shubshi-Meshre-Shakkan in *Ludlul bel Nemegi*, Mesopotamia, 13th century BC

Endnotes

Note 1 --

Middle Eastern dating is based on comparison of pottery and other objects with Egyptian wares. This dating in turn is based on the various fragments we have of the list of dynasties and pharaohs prepared by Manetho in Ptolemaic Egypt. The original text is lost, but it is quoted partially by many authors in antiquity. The chronological sequence was set out in the 19th century, and is incorrect by about 400 to 600 years, mainly the period of 1200 to 700 BC. Thus the archaeological date of 1200 BC, when all cultural activity in the Middle East came to a sudden halt, is actually 800 BC.

This accounts for a gap in the archaeology of Greece called the "Dark Ages of Greece," after which material culture (of the Mycenaean Greeks) picks up in 700 BC exactly where it left off in 1200 BC. This missing era includes such quasi-mythological adventures as the Trojan War, the exploration of the Black Sea by Jason, and the Dorian invasion. The "Dark Ages of Greece" extends to all of the Middle East. The Greek and Roman historians of 2000 years ago disagree completely with this chronology.

As P. John Crowe, wrote in "The Revision of Ancient History" (*SIS Conference*, 1999):

"Archaeology, when interpreted with an open mind, has now actually proved beyond reasonable doubt that the Dark Ages did not exist, but the proof is ignored. Vested interest in the status quo has won the day. Huge amounts of public money are being spent on studying this Victorian invention, and hundreds of books written about them without resolving their historicity. Sadly, it seems no one in academia has had the courage publicly to question seriously the basic assumptions upon which Egyptian chronology, the progenitor of the Dark Ages, is founded."

Many archaeologists prefer pottery shard dating over Carbon-14 dating, especially because

inspection of shards is much less expensive and Carbon-14 dating was entirely destructive until recently. If the dating by pottery shards is correct, it should also be more accurate (if the pottery dates don't hinge on a fictional chronology), for there is an almost complete year by year known sequence of, for example, amphora used in the wine trade by the cities of export.

I originally suggested that Hutchinson must have used Carbon-14 dating, so that the approximate dates of 1400 BC and 700 BC could be accepted. But this, I now realize, is a coincidental extension of the "Dark Ages of Greece," although the quoted dates of 1400 BC and 700 BC fit my narrative of the incident of circa 1500 BC. Alfred de Grazia, in *The Iron Age of Mars* (2nd ed. 2009), concurs that these dates may indeed reflect the devastation by Venus in circa 1492 BC and the later destruction by Mars starting in 806 BC.

[\[return to text\]](#)

Note 2 --

As an example of an 8th-century BC destruction, consider the excavation of Troy (Hisarlik). Four- to six-foot deep layers of burned material were found here, as in many other cities (citadels). No ashes from forest fires or from a volcanic eruption have ever exceeded six inches. This suggests simultaneous forest fires and hurricane winds. It suggests, in fact, the deposition of wind-carried burnt materials, including soils, specifically to hilltop locations.

[\[return to text\]](#)

Note 3 --

Using the kinetic energy of Earth based on the forward orbital speed (only), the change of 1500 BC amounted to four times the change (loss) in energy of either 3147 BC or 2349 BC. The disturbances of 747 BC, by comparison, represent a change of only 1/8th the magnitude of 3147 BC.

[\[return to text\]](#)

Note 4 --

I have probably overemphasized Quetzalcoatl for Mesoamerica, except as recognized from his properties. With the Mexica, at the time of the Spanish invasion, Quetzalcoatl did not have much standing. Not so, however, with the Maya.

Neith probably represents the southern ball plasmoid first seen in 10,900 BC. The crossed arrows (or shuttles) used as her identifying name represent the beams of electrons shooting like arrows past Earth.

[\[return to text\]](#)

Note 5 --

Seven approaches by Venus are noted in the Maya *Chilam Balam*, of which four can be

assigned to the period of 2349 BC to 2193 BC. This is also the only period of time when the interval between approaches was actually 52 solar years.

There is good reason to believe that the orbit of Venus crossed the orbit of Earth until 1492 BC, but not afterward. In 1994, Lynn Rose and Raymond Vaughan calculated, on the basis of the Assyrian clay tablets known as the *Venus Tablets of Ammizaduga*, dating to the 7th century BC, that the eccentricities of the orbits of Venus and Earth were still 0.15 and 0.10 respectively before 670 BC (reported at the Kronia Conference, Portland, 1994). This suggests the possibility that in the 7th century these orbits did not cross.

A calculation can be made of the perihelion and the aphelion (the closest and furthest distance from the Sun) of the orbits of Venus and Earth for various estimates of orbits (based on calendar information) since 3147 BC. This reveals that the orbit of Venus could have overrun the orbit of Earth, although this would only happen if the orbits of Venus and Earth precessed (rotated about the Sun) to a relative location around the Sun where the perihelion of Earth coincided with the aphelion of Venus. See Appendix B, "The Celestial Mechanics" for estimates.

Thus in more remote antiquity, at long intervals, and probably for periods of hundreds of years, Venus would appear as a planet on an outer orbit. Rather than remaining within some 30 degrees of the Sun, Venus would move across the night sky from horizon to horizon (rather than to just show in the early evening and before morning), as other planets do. Normally, because of its brilliance, Venus would have been seen during the day also.

This infrequent appearance of Venus beyond the orbit of Earth explains the strange Sumerian legend where Inanna (Venus) visits hell or the netherworld (*Inanna's Descent to the Nether World*). The "netherworld" is the zodiac of the south skies, of course. In the legend she is stripped of her garments (loses her coma and tail), losing one garment at each of seven gates (the rings of the Absu), and her body is hung from a hook (came to a visual standstill), to be rescued later. If Venus moved beyond Earth and further away from the Sun, the coma and plasma tail would certainly reduce. Even moving away from Earth would seem to do this visually. In line with Earth, the tail of Venus would not be seen. The movement through "seven gates" (the Absu) places the story in the southern skies. To be "hung from a hook" implies that a foreshortened plasma tail would have pointed up (or down), away from the location of the Sun 180 degrees removed in the zodiac. But being "hung from a hook" is actually a better simile for the fact that the trajectory of Venus would be slower than that of Earth at this location, and Venus would have been seen in retrograde motion (as Earth passed Venus) and thus seemingly to come to a stop. This happens today with Mars.

[\[return to text\]](#)

Note 6 --

It is suspected by some that Venus might have turned over at this time, so that she started to rotate backwards, as is the case today. I doubt that this happened. As a satellite of Saturn,

Venus may never have had much of a spin. The earliest iconography seems to indicate that Venus was already spinning backwards.

Because of Venus's extremely dense atmosphere (almost like an incompressible liquid), it is possible that it did not experience the electric repulsive impulse on one hemisphere, which would have changed its orbit. If the atmospheric shell absorbed the shock, the pressure might have spread entirely around the planet, compressing the more rigid inner sphere of rocky material equally in all directions instead of moving the planet in space. It is also possible that a significant part of the atmosphere was simply blown away from the planet. Venus, in fact, seems to change its orbit very little over the course of 3000 years. See Appendix B, "The Celestial Mechanics" for estimates of the length of the "Venus cycle" from various periods between 2349 BC and today.

[\[return to text\]](#)

Note 7 --

A Pacific Ocean impact might be confused with the Eltanin impact site in the far Southeast Pacific. The Eltanin impact is apparently the only "impact evidence" ever found in an ocean, aside from craters at the continental slopes. The Eltanin impact dates from 2.15 million years ago. This was first detected (in 1955) via ocean bed iridium and displaced diatomic material (ocean bottom sludge). An impact site was determined in 1966 as an 82-mile (132-km) diameter area, in 3-mile-deep (5-km-deep) water. A compressive impact to the ocean, because water is incompressible but very fluid, would leave no evidence aside from tsunami damage to the continents and possible transverse impact to adjacent continental slopes.

The impact of 1492 BC was likely experienced near the equator, since this would have happened "in early spring," as Exodus records. The line extending from the Sun via Venus to the surface impact site would have passed below the equator, thus moving the southern hemisphere south, that is, away from the Sun. It might be suggested that the very large displacement of the Earth (to a new orbit) was entirely due to the fact that the impact location produced very little of a gyroscopic reaction. Rather than the impact energy being absorbed by a gyroscopic response, it was transmitted directly to the center of the Earth.

[\[return to text\]](#)

Note 8 --

The suggestion that Lake Titicaca was lifted to its present elevation of 12,500 feet through some unspecified catastrophe was made by Velikovsky in *Earth in Upheaval* (1955). The archaeological record would have suggested that this would have happened in historic time, after Tiwanaku (Tiahuanaco) was already built. But the archaeology of this site, the conditions of local agriculture (abandoned terraces at the snow line, sterile conditions, "maize will not ripen"), or geological details (raised beaches, slanted strand lines, marine crustaceans) cannot sustain this. It seems more reasonable to suggest that the Alto Plano and the Andes mountains were raised maybe 3000 or 4000 feet (1000 to 1500 meters) by the intrusion of magma below the established Cordilleras.

What is more convincing is the occupation of the site after 1400 BC and a thorough exploitation of the available agricultural conditions, not the least of which is that the large lake acts as a heat sink -- in a manner also found to be in use on the eastern slopes of the Andes in the same region, resulting in the ability to sustain a population of a half million or more. Tiahuanaco was built after 800 BC. A drought in about AD 1000 ended the preeminence of the site.

It is possible that the Andes moved up in response to the compressive shock in the Pacific. Even though water is an incompressible liquid and the shock would have transferred to the underlying sea bottom, it would also have radiated out from the location of the impact. But I think the occurrence of marine specimens in lakes of the Andes provides the most solid evidence, and that only as evidence of a giant tsunami from the ocean.

[\[return to text\]](#)

Note 9 --

If Venus and Earth were on orbits with radiuses of 0.72 AU and 0.83 AU respectively, which does not allow for the eccentricity of the orbits (see Appendix B, "the Celestial Mechanics" for these values), they would have been traveling at speeds of:

Venus: $2 * \pi * 0.72 * \text{AU} / 225 = 1.87$ million miles per day and

Earth: $2 * \pi * 0.83 * \text{AU} / 273 = 1.77$ million miles per day.

The difference in speed of **100,000 miles per day** would largely determine how long an electric contact would last. If the plasmaspheres of both planets measured about 40 planet diameters, then together they would span about $2 * 40 * 8000 = 640,000$ miles. The total time of the contact would thus be limited to about six days. (On an inner orbit, Venus traveled faster than Earth.)

There was near continuous arcing in 1492 BC, unlike the electric contact in 2349 BC which consisted of discrete plasmoids. But the lifted water vapor which started to cover the skies

would have cut short the electric arc. West of the impact location (Asia and North Africa) the arc would have touched down, but after crossing half of the Atlantic, it would have mostly dissipated at the cloud cover which was moving east from the Pacific.

[\[return to text\]](#)

Note 10 --

If Earth and Venus were on circular orbits, they would not have approached closer than 10,000,000 miles, **(0.83 - 0.72) * AU = 10,230,000 miles (16,473,000 km).**

I have used Velikovsky's claim for the "scorched stones" of Arabia. But it might be suggested that this happened in 685 BC, when Assurbanipal notes Venus as "raining fire over Arabia."

[\[return to text\]](#)

Note 11 --

There is a very large secondary literature following up on the hints first supplied by Velikovsky's *Worlds in Collision* (1950). Talbott dismisses Velikovsky's findings, arguing that the "story" of Exodus is largely a formal repetition of elements taken from the events at the end of the "Era of the Gods," but Talbott and his group have never described this ending event. I did.

It is probably true that the older story-constructs were bound to be reused for later events. I have, in fact noted this for the Exodus described in this chapter. It is overwhelmingly obvious.

Velikovsky notes that he had trouble deciding whether to attribute events of 1492 BC to Venus or to Jupiter. He settled on Venus and stated that in the end he was completely convinced. But I am, at times, not completely convinced. Reading *Worlds in Collision* with the development of the Saturnian Theory (as developed in this text) and the plasma information in mind, you will be able to detect when his sources substitute Jupiter for Venus, or when the more likely alternative reading would point to Saturn rather than Jupiter. There are actually sources pointing directly to Jupiter as the agent of destruction, but these are few and probably erroneous, for an electric interaction with Jupiter would have been wildly destructive, as we saw for the event at the start of the Younger Dryas.

More frequently Velikovsky uses sources which are obviously from the 8th and 7th century BC, and applies them to the events surrounding the Exodus of 1492 BC. This includes quotations from the Hebrew prophets, the 7th or 6th century *Zend-Avesta*, quotations from Assurbanipal which are obviously contemporaneous with his reign, and the use of the *Venus Tablets of Ammizaduga*. Unlike the misidentification of Jupiter for Saturn, these are more serious faults.

I also have objections to the frequent application of "modern physical understanding" to

ancient texts when these texts are not at all clear. Velikovsky tends to read many phenomena as "meteors" when in fact this is often completely unwarranted from the textual descriptions, and the phenomena would better be left as unexplained. Frequently also texts are taken to be metaphorical (analogical) understandings, which seems totally uncalled for.

Similarly with a number of quotations to the effect that dawn and sunset were interchanged at this time. In fact, if you turn the spinning globe of the Earth upside down, you will find that the sun still rises in the east. Similarly, the period of increased night or day is due only to a change in the location of the Earth's axis. Spin does not stop, for the amount of energy required to bring rotation of the Earth to a stop is a trillion times greater than it would take to turn the Earth upside down.

But the gyroscopic reaction of the Earth to an external torque will cause the spin axis of the Earth to rotate through a circle and the Sun will seem to stand still, depending on where you are located on Earth. The reaction to an external torque is a twist (torque) with the axis of the torque at right angles to both the spin axis and the axis of the applied external torque. The gyroscopic reaction will be smooth in starting and stopping, and cause only minor geological disturbances. Seismic reactions to the initial shock will be violent and longer lasting. Neither Velikovsky, nor any of the later researchers (except one), have considered gyroscopic reactions.

The notion of the Earth turning upside down, or that the pole relocated, is discussed in the Appendix "Polar Relocations."

[\[return to text\]](#)

Note 12 --

John M. Barry, in *The Great Influenza* (2004), writes:

"[T]he relative lack of impact [that the influenza epidemic of 1918] left on literature may not be unusual at all. It may not be that much unlike what happened centuries ago. One scholar of medieval literature says, 'While there are a few vivid and terrifying accounts, it's actually striking how little was written on the bubonic plague. Outside of these few very well-known accounts, there is almost nothing in literature about it afterwards.'"

The Black Death (bubonic plague) of the 14th century AD killed half the population of Europe.

[\[return to text\]](#)

Note 13 --

Although repulsive electrostatic forces operate between planets enclosed in a single plasmasphere initially, a difference in charge between the planets will also be seen as a

voltage difference (easily amounting to millions of volts), and especially as the charge of the facing hemisphere of the secondary is induced to an opposite polarity from the primary. This will cause an attempted charge equalization, resulting in an arc from one planet to the other. The arc, to avoid increased resistance, will travel between the nearest surfaces thus impinging at a right angle to the surface. The arc will not remain at one surface location, but will move, as the planet rotates, to an adjacent region as that region comes closer, and will attempt to hang up (slow or stop) at locations of higher elevation. The Earth in rotation moves at a rate of about 500 miles per hour (800 km per hr) past the arc at mid latitudes.

The production of the arc is entirely equivalent to terrestrial lightning. As negatively charged clouds pass over the Earth, electrons are chased away from the surface below the clouds, thus increasing the voltage between the clouds and ground.

[\[return to text\]](#)

Note 14 --

It is actually amazing how accurate the descriptions from various sources are to a view directly up into a Birkeland current. The many heads of Typhon are the tubes of excited electrons. At the thunderbolts.info forum, poster Greycloud mentions that Plutarch in *Isis and Osiris* (AD 200):

"... in a throw-away comment, Plutarch mentions that according to Eudoxus, Typhon (Egyptian Set or Seth) had 56 angles and that Pythagoras assigns the number 56 to Typhon."

-- Apr 20, 2008 12:02 pm; in a thread "dating," which has since been removed.

I would have been sufficiently impressed by mention of the "many heads of Typhon." The 56 separate tubes is the normal count of strands of a massive Peratt plasma column, here seen as if at close quarters.

The battle of Marduk (Jupiter) and the dragon Tiamat -- in which Marduk drives a three-pronged spear into the mouth of the dragon -- as well as Indra and Vrtra, Zeus and Typhon, and any number of other pairs composed of the supreme God and a dragon with the body of a snake, all properly belong to another period -- the fall of the Absu in 2349 BC. The snake-like dragon in 2349 BC is the plasmoid from Venus.

The plasmoid appears again in (astronomical year) 685 BC. This will be discussed in a later chapter.

Velikovsky quotes a number of Roman and later authors and chronographers (at times as secondary sources) to the effect that the apparition was seen as a giant red-globed comet. Pliny in the first century AD writes, "A terrible comet ... twisted like a coil ... [and] a ball of fire." The comet is generally known as Typhon, after the last pharaoh of the Middle

Kingdom, Tau Timaeus, rendered as Typhon in Greek (Velikovsky). Manetho records that, in the time of Tutimaeus [Tau Timaeus], "a blast of God's displeasure" fell upon Egypt and ended the Middle Kingdom (Velikovsky). The end of the kingdom actually came slightly later when the Hyksos invaded the Delta, taking advantage of the widespread destruction in that region.

Since there are many similarities, the Typhon legend is easily confused with the Phaethon legend, where Phaethon, the son of Helios, the Sun, takes his father's chariot for an uncontrolled ride through the sky, burning up parts of the Earth. The ride of Phaethon happens in 685 BC, as I will relate in a later chapter. This is where the trident of Marduk belongs also.

[\[return to text\]](#)

Note 15 --

It should be understood that only the outer layer of the plasmasphere is electrically active in the minor contacts described in the text. The outer layers of a plasmasphere (and the extended tube), called the double layer, are conducting surfaces. The major repulsive electric force interactions happen only when the two planets can "see" each other within the combined plasmasphere.

[\[return to text\]](#)

Note 16 --

Velikovskian investigators have always assumed that the "fallen sky," which, from various sources, lasted 20 or 40 years, was made up of dust from the tail of Venus. Thus there was some disappointment among Velikovskians that no record of "dust" was found in the Greenland ice cores at a location corresponding to about 1500 BC. As I have stated, there was no dust in the edges of the tail of Venus (and certainly very little *within* the tubular form of the tail), and, as others also maintain, dust would, at any rate, have settled out in a few months. But nanometer soot from forest fires would not have settled out very soon. I refer the reader to the chapter "Tunguska and Chicxulub."

This is not to say that the whole of the ice core data is not muddled by many unjustified assumptions about formation of the Greenland glacier. Volcanic dust from the Santorini explosion of circa 1350 BC was at one time held to be detected, but this was later repudiated. The lack of funds has greatly limited study.

On the other hand, both the Grand Canyon of Arizona and the Valles Marineris of Mars show what can happen with massive plasma lightning strikes. The Valles Marineris is 3000 miles (4800 km) long and five miles (8 km) deep. The material which used to be there has disappeared. The same is true for the Grand Canyon. The Grand Canyon is a mile deep in places. But there is no run-off of water-eroded soil to be found anywhere. Valles Marineris probably dates from 720 BC, due to a strike to Mars from Venus. The Valles Marineris scar

has a large left-right symmetry, as would be expected with a massive lightning strike (so says Thornhill).

[\[return to text\]](#)

Note 17 --

The "wanderings in the desert" were most likely a migration into the Arabian peninsula, towards Mecca. The Israelites were herders, and "wanderings" would not be unreasonable.

The years of darkness were real. They are also recounted in the Vedas. The Mesoamerican records specify a darkness happened twice. This would be the events of 2193 BC and 1492 BC. For one of those events, the cloud cover lasted 25 years.

For the Olmecs the period after 1492 BC was the start of history (and the start of the Haab calendar). When the skies lifted again, after a long period, it was celebrated as the creation event (or a re-creation event) with altars which show atlantes (the Gods of the four cardinal points) holding up a platform representing the lifted skies, or show a God in a niche below the table (recalled from 2349 BC). An altar from near San Lorenzo has the edges of the altar marked with the glyph for the word "cloud." The same altar design may be found at Chichen Itza, 2000 years later. The table is still used by the present Maya as part of a "centering" ceremony which celebrates the creation of the world.

[\[return to text\]](#)

Note 18 --

This passage, suggested by Velikovsky, was for me one of the more convincing data points in his exposition. Moses heard the commandments of his God as a cadence of repeating triple syllables -- in the groans of the seismic convulsions of the Earth.

[\[return to text\]](#)

Note 19 --

It is amazing that the results of the literary analysis by Velikovsky, in *Worlds in Collision* (1950), closely matches the results which are expected from physical considerations.

What is almost certain (from later data) is that Venus did not change its orbital period by more than four days as the net result of the interactions, and that the orbit of Venus remained elliptical, although the eccentricity may have changed. The orbit of Venus did not circularize until after 670 BC.

[\[return to text\]](#)

Note 20 --

The length and dates for the rule of the Hyksos are in total confusion. Manetho (AD 200)

records 511 years. Scholars of the 19th-century have estimated 200 to 400 years. Traditionally the period extends from 1648 to 1539 BC, which incorporates a dating error of 150 years. Even today this period has not been sorted out. Egypt split into three divisions, the Delta region held by the Hyksos, a central region held by the pharaohs of Memphis, and another independent region south of Aswan, held by Nubians, who modeled their culture on the traditional Egyptian civilization.

Velikovsky suggested 400 years for the intermediate period, from after 1450 to 1040 BC. This has been followed up on, confirmed, and also adjusted, by numerous researchers, but dates are still contested by most archaeologists. See Velikovsky, unpublished documents, "World Fire" and "Hammurabi and the Revised Chronology" at [\[www.varchive.org\]](http://www.varchive.org)
[\[return to text\]](#)

Note 21 --

Velikovsky makes note of the endless rotation of the names of the Gods, as follows:

"A new catastrophe caused by another member of the planetary family would easily raise it to the position of the supreme deity; on the other hand the fidelity to the protective deity of the previous age would cause one or another tribe to remain faithful to the old cult; religions and gods are tenacious contents of the human soul and peoples do not part easily from them."

"Thus we see how the worship of Jupiter superseded that of Saturn; the worship of Venus (Minerva, Athena, Astarte, Baal) in many regions eclipsed the worship of Jupiter; and the advent of Mars and its participation in celestial wars brought new schisms into religious thinking and caused new religious wars. Thus the Greeks battled under the patronage of the planet Venus (Athena) whereas the Trojans battled under the protection of Mars (Ares); but Ares was also recognized as god by the Greeks and Athena as a goddess by the Trojans. Similarly the Toltecs, faithful to the cult of Quetzalcoatl, the planet Venus, warred and succumbed in the war against the Aztecs, the younger race that proclaimed Mars (Huitzilopochtli) as their god. The Romans regarded Mars as their protective deity but their main sacrarium was dedicated to Jupiter and Minerva (Athena). Egyptians also regarded Amun as their supreme deity and Ra was its other name. In another cult center of Egypt Osiris and Isis were worshipped as supreme gods; in early times they represented Saturn and Jupiter; at a later time Isis became synonymous with Astarte-Athena, the planet Venus."

"A few peoples through consecutive planetary ages kept fidelity to the ancient Kronos (Saturn), whose age was previous to that of Jupiter. Thus the Scythians were called Umman-Manda by the Chaldeans, and Manda is the name of Saturn. The Phoenicians regarded El-Saturn as their chief deity; Eusebius informs us that El, a name used also in the Bible as a word for God, was the name of Saturn."

-- Velikovsky, unpublished document, "The Birth of Monotheism" at [\[www.varchive.org\]](http://www.varchive.org)

Enn Kasak and Raul Veede, in "Understanding Planets In Ancient Mesopotamia," in *Folklore*, Vol. 16 (2001), write:

"The functions of different gods tended to vary by city states, but of the Great Seven [of the Sumerians], An was universally the god of heaven, Enlil the god of air and earth, and Enki the god of water and wisdom; less important were Utu the Sun god, Nanna the Moon god, Inanna the goddess of love and war, and Ninhursag, the mother of gods."

"The name and status of the main god depended on who had the power. In Sumerian times, the greatest god was An, whose son was Enki. In the Old Babylonian period, of course, the city god of Babylon, Marduk became the main god and was also to be son of Enki and grandson of An. As An was more like a 'deus otiosus,' Marduk as an acting god started to be identified with the acting main god Enlil, whose son, god of war Ninurta was identified with Marduk's son, multifunctional Nabu."

"Saturn is hard to interpret, as it is connected to Ninurta, but this leads us through Nabu straight to Mercury... . Sumerian Nanna and Akkadian Sin are the Moongod, Utu or Samas is the Sungod without a hint of doubt."

The status of Mercury (Nabu) as a God is curious from our perspective, since we see so little of Mercury. Mercury orbits close to the Sun and today only shows a few degrees above the horizon before sunrise or after sunset and on only a few days out of every three months. It clearly suggests that Mercury was on a radically different orbit and was much more prominent in the skies of antiquity.

Note 22 --

There is a very large voltage difference between the Earth's crust and the ionosphere. The voltage difference can become extremely high even with small changes of elevation, and mountaineers especially have experienced severe shocks under adverse atmospheric conditions -- simply by reaching up to gain a hold on some rock surface.

At ground level the voltage difference amounts to about 600 volts in six feet (2 meters) of elevation. But any tall conducting structure takes the potential at ground level and inserts it into an elevation with a higher potential. Thus the voltage difference at the top of a tall structure is much greater with respect to the surroundings, often enough to ionize the air, especially at the tips of sharp spikes. This will be seen as Saint Elmo's fire.

Note 23 --

I would not make the suggestion that material of one plasmasphere could be transferred to another in "brushing" each other while passing in space, if it were not for the fact that only *this* explains the sweet smells of the 8th and 7th century BC, noted throughout the world. The Olmecs call them "fragrances of flowers." The fragrances were associated with close passages of Mercury.

[\[return to text\]](#)

Note 24 --

It is not at all certain that Yahweh is to be equated with Venus. The planet Mercury is much more likely, with Jupiter even more so. Yahweh was defined in the exile era (563 to 483 BC), or the post-exile era, as a singular spiritual (unsubstantial) entity along the lines of Persian Mazdaism (which actually was an invocation of Saturn or Jupiter).

On the flaming bush, see Joel T. Klein, *Through the Name of God* (2001), which offers "burning bush" as a later mistranslation of an Egyptian word originally equivalent to Shamash.

Note 25 --

Alfred de Grazia is an accomplished academic, and read everything ever written on Moses and the Exodus before writing *God's Fire* in 1983. I am using his text as a source because it reflects on the developing subjective consciousness of this period (which he would probably deny).

[\[return to text\]](#)

Note 26 --

Aris M Hobeth, in *Moses in the Twelfth Dynasty Egyptian Literature* (2002), places Moses, and a dozen others Bible personalities from Exodus through *Numbers*, in the Egyptian 12th dynasty -- some as pharaohs, including Moses as Senusret III (the literary Sesostris), Aaron as the high priest of On, others in secondary roles. The compelling analysis is based on the clear parallels derived from a half dozen narratives extant from the 12th dynasty. The details between the Bible and the literature of the 12th dynasty is amazing and convincing. See Hobeth's site, [\[ArisMHobeth.com\]](http://ArisMHobeth.com).

Hobeth equates Moses with Senusret III. He suggests dates around 1500 BC. The 12th dynasty is traditionally dated to 1985 to 1795 BC, on the basis of a single Sothic date -- a literary reference to the rising of "Sothis" in the reign of Senusret III and retrocalculated to be in 1870 BC. It is not. The whole system of Sothic dating is bogus, and has today been abandoned, although it still held on to in textbooks.

Relocating the 12th dynasty to around 1500 BC has also been done by a number of other people: Immanuel Velikovsky, *Ages in Chaos* (1952), Bible apologists like Donovan A. Courville, *The Exodus Problem and Its Ramifications* (1971), and academics like Peter James, et alii, *Centuries of Darkness* (1991), and David Rohl, *A Test of Time* (1995).

Damien Mackey makes the same claims as Hobert with *Solomon And Sheba*, in *Chronology & Catastrophism Review* (1997), based on earlier work by Velikovsky, John Bimson, and others.

Note 27 --

It is probably the presence of the Hyksos (or Mitanni) which kept the Israelites from advancing north into Canaan for 40 years. Josephus mentions the Philistines.

[\[return to text\]](#)

Note 28 --

P. Warlow, in "Geomagnetic reversals?" *Journal of Physics* (1978), suggested an inversion of the Earth like the operation of a toy "Tippe Top" which moves the precession reaction torque (the gyroscopic reaction) to the upper portion of the top, making it look as if the initial spin had remained in place. This happens as the globe is inverting. This exchanges the east and west (for the Tippe Top). The Sun will then rise over some western landmark of the horizon. If the rising Sun defines "east" then east and west have interchanged.

The Tippe Top concept is a totally erroneous concept simply invented to satisfy the requirement of seemingly exchanging east and west, something supported with many

quotations by Velikovsky, none of which prove the point. See the Appendix "Polar Relocations" for details.

With Warlow's model the Earth would not upright itself again, or if it did, it would happen by means of some other catastrophe (it is claimed). For Warlow this suggests placing one catastrophe in 2300 BC (of which he has no details) and another at the time of the Exodus. Not untypical of catastrophists like Warlow, he then equates one event with Typhon and the other with Phaethon.

Warlow's model also required the Earth to rest on a table top.

Note 29 --

[Image: An ark carried in a boat by Egyptians. (ND) After de Grazia.]

There are Egyptian and Mesopotamian images of devices which look very similar to the description we have of the Ark of the Covenant.

In 2 Samuel 6:2 is a description of Yahweh, "... the ark of God, whose name is called by the name of the LORD of hosts that dwelleth between the cherubims." The God of the Israelites dwelt with them, in visible form.

Note 30 --

De Grazia and a number of other people have suggested radiation poisoning as the source for the widespread "leprosy" of biblical times (as well as the barrenness of women and the falling out of hair mentioned by Ipuwer). It has been suggested that the Ark may have contained radioactive materials, and for this reason was returned to the Israelites after being captured by the Philistines, who got sick after approaching the Ark. However, UV and X-ray burns are more likely than radiation poisoning.

On the other hand, the interplanetary lightning strikes at the Great Lakes in circa 10,900 BC,

left areas of lower Michigan radioactive. To attribute radioactivity to the *contents* of the Ark seems a little far-fetched.

Others have suggested that the "leprosy" of antiquity was a slow acting viral infection. Today it is known to be a bacterial infection.

Note 31 --

The need for a ground plane which would be responsive to induction of positive charges was known long before the Middle Kingdom of Egypt. Many of the megalithic structures in Northern Europe, dating from 3400 to 3200 BC, are surrounded with ditches and at times with wells backfilled with rock. These would act to collect and hold groundwater, thus providing a larger flat plane which could be "electrified" by induction from an overhead electric field. Even when dry, the ditch acts to increase the potential difference between the tops of the monuments and the ground plane. Certainly many of the locations of ancient sites were chosen for this reason, which is why we often find ancient megalithic monuments grouped together.

[\[return to text\]](#)

Note 32 --

This quote by de Grazia relates to Jaynes's use of the traditionally accepted dating of the event of the battle at Troy to circa 1200 BC (attributable to a hasty comment by Herodotus) and the later reduction to text of the *Iliad* to circa 700 BC. The Asiatic Greeks have disagreed with the early date of the war since 400 BC. (See also the endnotes to the chapter "The Tablets of Ammizaduga" on the dating question.) The late date of the final authorship of the written version of the *Iliad* is unquestionable. It may have been as late as 650 BC. But in that there is no indication of a "development" of Greek literature -- the *Iliad* bursts forth as a fully developed literary masterpiece after 700 BC -- it has always been assumed that it was preceded by a long tradition of oral poetry. It has never been considered that perhaps all previous literary efforts in mainland Greece and Greek Asia Minor were lost during worldwide catastrophes. Even Plato remarked on this.

Jaynes assumed that the *Iliad* represents the compositional efforts of a pre-conscious bard, and used the *Iliad* as a centerpiece in the analysis of a developing subjective consciousness. Jaynes thus had to establish a method of verbal transmission, ending with a last pre-conscious writer, Homer, 500 years later. Jaynes's suggestion is that the songs must have been transmitted by some trance-like mind-state among bards.

But this position is not needed. The theory of verbal transmission is partially based on the studies of Croatian bardic traditions in the late 19th century or early 20th, which in turn was applied to such epics as *Beowulf* and the *Iliad*, especially in terms of the formulaic sentence structure which grates on our sensibilities today but which is explained as a method of line

completion within a required meter. But the idea of faithful verbal transmission in the Balkans has not held up on closer scrutiny.

After having read the *Iliad* a half dozen times, I seriously doubt the need for "trancelike states." I think the *Iliad* may have been purposely written in the style of an ancient document. And it certainly captures that flavor and, at the same time, the epic is a masterpiece of political balance by placating the egos of both the Asiatic and the European Greeks. The great care taken with this, as with all aspects of the epic (such as with its internal time structure), would suit Jaynes's research equally well, and perhaps even better than if the *Iliad* were a totally genuine document.

It looks much more like the *Iliad* was written by a fully conscious poet sometime after 747 BC, about a war completed perhaps as much as 300 years earlier, or more likely as fictional. As a fiction there is no need to have a pre-conscious poet who transmits poetry orally. There are just too many "literary devices" in use with the *Iliad* to suggest anything different, including the fact, recognized long ago by the Greek editors of the *Iliad* in 600 and 500 BC, that Homer uses a "poetic diction" which does not match any spoken Greek dialect. He even makes up words as he needs them. There are some notable anachronisms in the poem and far too much heroics among its characters. Even so, I have no problem with the scope of Jaynes's analysis.

When you read how one war chief asks another for a favor with, "Considering the favors you have done me in the past, I thought I could ask for another," you realize that Homer is no rhyming automaton, but a fully subjectively conscious human.

See also the essay by Livio Stecchini, "Gyges and Homer," at [\[www.metrum.org\]](http://www.metrum.org), which places the writing close to 680 BC, and holds the *Iliad* as a fictional polemic poem written for the benefit of the Asiatic Greeks.

Talbott has suggested that not only is the *Iliad* a fiction, but that it recounts the war of the Gods in 3147 BC. In that there are no references to the solar nova event of 685 BC, it could be suggested that the *Iliad* was reduced to written form before 685 BC (680 BC in Eastern Mediterranean chronology).

Note 35 --

I have noted the prevalence of Mercury shortly after this time (circa 1200 BC), as if Mercury again passed over the Earth's orbit on a regular basis (which previously had started in 1900 BC). Note the resemblance of the snake wound about a pole and the Caduceus of Mercury. Moses died below Mount Nebo, named after Mercury.

[\[return to text\]](#)

Note 36 --

Earthquakes are often preceded by electric discharges from deep in the Earth. Piezoelectric voltages are generated by the distortion of quartz-bearing rock.

The breeched walls of Jericho have been excavated, and were originally dated to have fallen due to earthquakes circa 1300 BC. The date was later revised to match the "standard" chronology of Egypt, erroneously placing the date about 600 years earlier.

Velikovsky, in an unpublished document, writes:

"The conclusion reached by the excavator of the great-walled Jericho -- a Middle Bronze city, destroyed only a short time after the end of the Middle Kingdom -- is in perfect agreement with the timetable of 'Ages in Chaos': the Israelites arrived at the walls of Jericho only a single generation after the end of the Middle Kingdom in Egypt, still in the Middle Bronze (the beginning of the Hyksos occupation). There is complete agreement between the archaeological finds and the scriptural record."

The city was looted, razed, burnt to the ground, and left unoccupied for 600 years.

Note 38 --

Venus may have made electric contact with Earth repeatedly, as I have counted six times, but recorded as seven times by various people in antiquity. Velikovsky and others have presented evidence of additional 104-year cycles or "ages" in use worldwide. Archaeologists at one time suspected a 50- or 100-year cycle (this would be 52 and 104 "Tun" years) of purposeful destruction of Olmec ceremonial centers in Mesoamerica, as, for example, at La Venta (800 - 400 BC). Although it would be suggested that the "cycles" would be based on sightings of Venus when it seemed to almost reach Earth (which it did not), in fact the celebration of the "52-year" interval was a religious ceremony determined by the calendar, and, since 1442 BC, may have had little to do with the location of Venus in the skies. See the chapter "Olmec Alignments" for a discussion of Olmec La Venta and other ceremonial locations.

In the *Chilam Balam* books of the Maya, the name for Venus suggests seven appearances (electric interactions) in prehistory. I can only locate six of them with certainty, so it is possible that the list of seven may have included an additional appearance either in 776 BC or in 685 BC.

[\[return to text\]](#)

Note 39 --

This is also the period of the first appearance of the oracle inscriptions of the Shang dynasty in China. The *I Ching* is of a later date, since a textual analysis places it after 700 BC, although the trigrams probably date to before 3200 BC.

Recovering the Lost World, A Saturnian Cosmology -- Jno Cook

Chapter 23: Destructions by Mars.

\$Revision: 42.85 \$ (quet.php)

Contents of this chapter: [\[The Ragings of Mars\]](#) [\[Calendar Reforms\]](#) [\[A Blast From Heaven\]](#)
[\[The Death of Quetzalcoatl\]](#) [\[The Ballgame\]](#) [\[The Winged Disk\]](#) [\[Endnotes\]](#)

Destructions by Mars

In mainland Greece, of 150 cities noted before the 8th century BC, only 13 survived to 650 BC. The same scale of destruction was experienced in Anatolia, the Middle East, and Italy. The period of 800 BC to 600 BC also saw the largest overseas colonization by the Greeks, as well as the virtual depopulation of the Eastern Mediterranean region and parts of Europe. De Grazia in *The Iron Age of Mars* (2009) estimates that of a population of 200,000,000 before 800 BC, only 5 million survived. The earlier level would not again be reached until AD 1900. [\[note 1\]](#)

This decline in population presents a serious problem to a reconstruction of history, for not only were there few survivors to write history, but they would have been largely illiterate and uninterested, and even adverse to recording history. We only have the braggadocio records of the Assyrians, and the jeremiads of the prophets of Judah. There are some later (a century later) recollections by the Persians which reach back over the previous hundred years. We also have the accumulated clay tablets of the fortune-tellers and astrologers of Babylon, who concerned themselves more with celestial forecasting than actual history (and mostly dated to after 650 BC).

It is thus with difficulty that history between 800 BC and 650 BC is extracted from incomplete and unserviceable records. Even the books of the Biblical prophets were written or rewritten at later dates from older records, to be put in the service of prophecy and monotheism, and are often not at all helpful. Very little of the writing looks to be contemporaneous with the events.

What we do have are archaeological findings for Anatolia, Greece, and Italy, and eventually for a much broader range of territory. The record of destruction is absolutely astounding. Nothing before or after has equalled the catastrophic devastation of the era of the 8th and 7th century BC. I'll fill in some details below.

This chapter will deal with the repeated close calls by Mars between 806 BC and 687 BC at 15-year intervals (closing in to within perhaps 40,000 miles (60,000 km) accompanied by Mercury. It will deal also with the travels in 685 BC of Mercury high through the sky with Venus (which was especially noted by the ancients) and the thunderbolt from Jupiter which stopped the fires at Venus and Mercury.

The Ragings of Mars

Do not let the 15 year intervals presented above detract from the facts of the utter devastation that Mars caused in India, the Middle East, the Mediterranean, Central America, and in the lower United States. Because of the destruction of cities and the dispersal of people, but primarily because Mars appeared at 15-year intervals, we have virtually no written records. Velikovsky never managed to determine the complete scope of the events, except to suggest a 15-year interval. The only suggestion of an actual time span is from the sparse mentions in the Maya *Chilam Balam*, and even here the record has to be reconstructed from inferences. (Although the last event involving Venus, Mercury, and Jupiter is well dated.)

The appearances of Mars was like bad weather, and it took time before astrologers of the Middle East could even determine that the events repeated at regular intervals, and could be predicted. What is generally known for sure today is that, starting in 747 BC with an Earth shock, and for 60 years thereafter, Mars passed close to Earth five times -- very close. But the prophets of Israel had started their warnings long before 747 BC. From the suggestions incorporated in the *Chilam Balam* and less so from the archaeological records of destructions of citadels in the Middle East, it could be suggested that the first strike by Mars was in 806 BC. The complete period of the ragings of Mars thus probably extended over 120 years -- 806 BC to 687 BC. [\[note 2\]](#)

Alfred de Grazia, in *The Iron Age of Mars* (2009), writes:

"Planet-Mars is tightly bound in ancient peoples' minds with gods who are paramount warriors, destructive heroes, crushers of towns and armies, dispatchers of plagues, and depicted as red in color. Many, if not all, nations worshiped the planet-Mars and the god-Mars, under their national names for both of them. In Babylonia he was Nergal, in Mexico Tezcatlipoca, for example. Hundreds of Mars identities around the world came into prominence at the same time."

Mars was seen on the day side of Earth as many of the descriptions make clear, although the night sky is invoked in some instances. Mars would have crossed Earth's orbit at an acute angle either in front of or behind Earth, moving in the spring from the night side to the day side, and in the opposite direction in the fall -- but 15 years later.

The *Popol Vuh*, in at least one instance where the celestial twins (Mars and Mercury) disappear into the night sky, identifies two stars and a nebula that they pass by (see a later

chapter). This allows placing the event both at a seasonal date and at a location in the sky.

Entry of Mars at an angle into Earth's plasmasphere (at an angle and far removed from Earth proper) would have removed the shadow portion of Mars's plasmasphere due to the Sun and replaced it with a shadow due to the Earth's electric field, and thus pointing away from Earth. Mars's plasmasphere would also isolate it from the Earth's field. It seems likely that for this reason there were no repulsive forces between Mars and Earth in all instances except one. We have no records of any instances of a sudden Earth shock except in 747 BC. The difference in charge certainly was exhibited with continuous electric arcing.

Thus it might be suggested that Mars moved to the day side of Earth to cause a sudden massive repulsive shock which changed Earth's orbital period by 5 days in 747 BC.

What about all the damage that is on record? Every year and a half Mars crossed Earth's orbit on its way to perihelion with the Sun, and again on its way to aphelion. At 15 year intervals, Mars crossed Earth's orbit close to earth, either going in one direction or another, and alternating between dates in late winter (March) and early fall (October).

Mars would approach Earth's orbit (the ecliptic) at 1.85 degrees from above Earth's orbit. In coming close to Earth (maybe as close as 40,000 miles) both would be at a near standstill with respect to each other. This might last a few days before Mars would advance beyond Earth and speed up (inbound) or slow down (outbound) with respect to Earth.

When near Earth, Mars would continue to lower (at the Spring Equinox) as Earth rotated. With each rotation of Earth ($8000 * \pi$) Mars would move about 800 miles ($40,000 * \tan(1.85/\text{deg})$) up or down. Although this is a rough estimate, it a reasonable indication of the damage done further north or south of the Mediterranean, like northern Europe and Scotland, and in the Americas in northern Mexico, and the states of Texas, New Mexico, and Arizona.

There are also records of solar eclipses during this period caused by Mars -- a phenomenon completely inexplicable to later researchers looking over Mesopotamian astronomical records. The fact that Mars was at times seen in the day sky, and at times must have blocked the Sun, might explain the obsession of Assyrian kings with eclipses, since it would be obvious that such eclipses were accompanied by wholesale destructions.

Prayers and pleadings to Mars proliferate in Mesopotamia and India during this period. The *Book of Amos* records the first major interaction with Mars as predicted by Amos. The *Book of Joel* also records the threat of Mars. A troop of warriors travels with Mars, called Maruts in Vedic sources, the "Terrible Ones," carrying gleaming spears and throwing fire, lightning bolts, and bolides to Earth. *Joel*, of course, identifies them as the "hosts [that is, the army] of the Lord." Joel also calls them Ariz, "Terrible Ones," the name for Mars adopted by the Greeks, Ares.

The Maruts are the companions of Mars, asteroids which had accompanied Mars since the time of the first dynasty of Egypt, when the Egyptians duly counted them as part of the herds of small and large cattle of Horus. They will also show up in the tales of Hercules as his stolen cattle or as the armies he raised for various exploits. [\[note 3\]](#)

In the Bible the "hordes" which accompany Mars could be equated to the various enormous groups of warriors supposedly slain in battles at that time. From Ussher:

- 957 BC: "Abijah and his army of 400,000 men, fought with Jeroboam and his army of 800,000 men. Because Abijah trusted in God, he obtained victory against Jeroboam. He killed 500,000 of Jeroboam's soldiers."
- 941 BC: "In the beginning of Asa's reign, Zerah the Ethiopian mobilised an innumerable army to invade the land of Judah. This force had 1,000,000 men... . Asa met this army with 300,000 men from the tribe of Judah and 280,000 from the tribe of Benjamin. He called on the name of the Lord and routed and slew that vast army and took much spoil from them."
- 741 BC: "Pekah killed 120,000 valiant men of Judah in one day. ... The Israelites also carried away captive from Judah and Jerusalem 200,000 women, boys and maids [who they released]."
- 710 BC: "The next morning there were found 185,000 dead men. After this Sennacherib shamefully broke camp and returned into his own land to rest at Nineveh."

All the above dates and the quoted text are from Bishop Ussher, *The Annals of The World*,

Chapter 4, "The Fifth Age of the World." The size of these armies, even if half or three quarters were camp followers, is astounding. And they all die. (The World War II invasion of Normandy involved only 176,000 troops, with a naval support of 196,000.)

This recalls the much earlier Egyptian counts of the Followers of Horus, or the contemporary (8th century BC) spear- and rock-throwing Maruts in the company of Indra (Mars) of the Vedas, or even, as pointed out by Isaiah, the attacks by fiery hot sand which entered through windows and under doors.

We might add to these the Myrmidons ("ants" or "ant people"), the troops of Achilles in the Iliad.

Greek legendary history holds the Dorian invasion of Greece to be the "return of the Heraclids," when the banished third-generation offspring of Hercules returned to lay claim to the Peloponnesus. The dates are very uncertain (but 761 or 762 BC could be suggested). Thucydides dates the invasion to 80 years after the Trojan war, where the Trojan war was assumed to have happened as early as 1200 BC. The invaders included the Spartans, who at best can be dated as an organized community only to about 750 BC. The two ruling families both trace their descent from Hercules (Mars) but, like all twin kings of antiquity, representing Mars and Mercury.

Except for these, there is no evidence of a "Dorian invasion." The Heraclids are the sons of Hercules which is Mars. They were seen in the sky, not on Earth.

All nations watched Mars during these years with great anxiety. Most notable among the destructive effects of these close passes is the frequency of earthquakes, due to gravitational and electric forces on the crust, but especially a moving electric arc which burned forests and lifted the material along with soil ahead of itself in a tornado the size of a hurricane. In an era of city walls, built as a measure against rampaging tribes, and most frequently built on hilltops, Mars becomes known as the "stormer of walls." The seven- to ten-foot cover of burnt matter and soil, which buried fortified hilltop citadels, far exceeds the amount ever deposited by any forest fires or volcanic eruptions (which is seldom more than a few inches).

Alfred de Grazia, in *The Disastrous Love Affair of Moon and Mars* (1984), notes both the imagined devastations by Mars and the archaeological record. He has reference to the event of 776 BC (the so-called 'ballgame'), but it probably more accurately reflects any of the events from 806 BC through 687 BC. De Grazia describes the destruction of Pylos, one of the destroyed locations, one of hundreds:

"Tidal waves wipe out nearly all coastal settlements (where perhaps 80% of the Greek-speaking population was contained in 800 B.C.). Chasms are opened; volcanoes are created and activated. Surface soils are ripped off by winds traveling at hundreds of miles per hour. Communities are obliterated or disrupted by showers of ash and debris, winds, water, fire, and famine."

At 35 degrees latitude, the Earth's surface would zip by an exterior planet at about 500 miles per hour (800 km per hr). At hilltop citadels the electric arc would pause, and the hurricane winds would drop the burnt soils and the ashes of incinerated forests. This, in fact, is the strange specificity experienced by archaeology. De Grazia continues:

"The Palace [of Nestor at Pylos] was destroyed in a 'holocaust' which 'consumed everything that was inflammable within it, and even melted gold ornaments into lumps and drops of metal.' The flames melted brick and stone into 'a solid mass ... as hard as rock.' In one room two large pots were fused 'into a molten vitrified layer which ran over the whole floor.' Everything that a human invader might desire was reduced to shapelessness. Stone was burned into lime. No human hands and hand-set fires could have wreaked such ruin."

He follows this with an exploration of Greek society in mainland Greece and Asia Minor, based partially on the content of the *Iliad* and the *Odyssey*. His analysis of Homer is without a doubt the most cogent I have encountered. The reader should be aware that, along with many others, I hold that the "dark ages" of Greece do not exist. Mycenaean Greece came to an end in 806 BC, not at the start of the 400-year gap of the Greek "dark ages" following 1200 BC. [\[note 4\]](#)

"The Homeric heroes, Odysseus and Achilles among them, typified the bands of survivors of the extensive Mycenaean civilization that was largely destroyed in the catastrophic interventions of the planets Mars and Venus in the Earth-Moon system in the 8th century. The plots of the Iliad and Odyssey, despite 2700 years of trying to make something else of them, clearly point to the skies as the source of the disruptive and awful events that produced the crazed heroes of the dark times. Western civilization has treasured and imitated the posturings of these mad warriors, hardly ever realizing what they were and how the docile mind of later generations would be affected when this madness was presented to it as normality and for inspiration."

Greece and Anatolia represented the epicenter of the repeated destructive close passes of Mars after 806 BC. Although Venus was seen near Earth in 776 BC, Venus was not involved in the destructions. De Grazia continues as follows. I have abbreviated the text and added in some of his quoted sources.

- *"The heroes boasted in the names of their parents, some of their grandfathers, and usually stopped at this point; some lapsed into claims of divine forebears in the second generation. ... The absence of 'family trees' among self-assertive 'nobles' raises doubts that they either knew their ancestors or, if they did, could claim any distinction on their behalf. ... This is exceedingly strange. It is not at all like 'primitive peoples' whose lives are bound into communities of blood served by totems. Nor like a bureaucratic society."*
- *"The warriors stayed away from their 'homes' so long that we could question whether they had any. They remind us of Vandals and Vikings who left home never to return. Of all of Ithaca's warriors, only Odysseus ever reached home. Odysseus played the pirate -*

- looting, killing, raping. Marauding was frequent, if not from one's neighbors then from pirates and foreign warriors."

- "It was a society where every man's hand was raised against his neighbor. ... 'The bearing of arms, particularly lance and sword, on all solemn occasions of civil life, was the distinguishing feature which, more than any other, marked the separation of classes in Homer's time.' [Emile Mireaux *Les Poems Homériques et l'Histoire Grecque* (1948)]"
- "In battle one encounters a frenzied behavior whereby fear is whipped up in order to gain courage. Eliade's words apply to the heroes: 'The frenzied berserker, ferocious warriors, realized precisely the state of sacred fury ... of the primordial world.' [Mircea Eliade *Cosmos & History: The Myth of The Eternal Return* (1959)]"
- "A frank, hollow, extreme braggadocio characterized the best and the worst of the fighters. The glorification of destructiveness seems interminable. ... There is a pervading sense of splendors of the past being gone and citations of armies, cities, and wealth appear to be grossly exaggerated. This pretentiousness is not that of nobles, [but] of a people who had lost something they once knew, did not own, but had given them their character."
- "They depended upon the seas but were bad sailors. There was no class of specialized sailors. Everyone was a 'sailor.' Maritime ventures were not materially distinguishable from piratical excursions."
- "They were meat-eaters: cattle, sheep, and wild game, animals of the uplands. 'For Homer fish is a detestable food, while Hesiod does not even deign to mention it. Never is fish eaten at the Homeric repasts.' [Mireaux]"
- "Gift-giving was often a spectacular affair. ... The things given seem often to be for re-giving, to be untouched and unused, even homely objects like linens, and the metal gifts seem all too frequently to have semidivine or divine 'makers' which, as false pedigrees conceal humble origins, may have concealed their origins in loot and theft. Their description, too, conveys an awesomeness, as if they were not familiar objects to the childhoods of the gift exchangers. They are described as pirates would speak of their misunderstood loot of pots and laces."
- "Chariots are used, not as battle-wagons, but to convey warriors to places where they would descend and fight. Their use was partly forgotten or had not been familiar to the types who owned them."
- "The Greeks of Homer, to conclude, did not come as an invasion from afar. They consisted of all kinds of Greeks. They were survivors, largely from the rural areas and the interior high lands. From personal experience and hearsay, they knew of the centers of their societies that had been destroyed. They often lacked kith and kin; they lacked communal security; they lacked law and order; they lacked education; they trembled upon the trembling earth."

The analysis by Alfred de Grazia covers only Homer, and the collapse of the Mycenaean Civilization. De Grazia thus places the composition of the *Iliad* and the *Odyssey* after 650 BC.

"For a grandly disciplined, informed, and stylized poet like Homer to write so sympathetically of his subjects, he had to be of their age, and to be of their age required that their age be the eighth century." [\[note 5\]](#)

But despite the destruction and dislocations, the Olympic Games continued. The attacks of Mars were at 15-year intervals, and not always at the same locations. Attempts at rebuilding destroyed cities (as for example, at Troy) continued, although this was very infrequent.

If Homer was "of their age," as de Grazia suggested, then the poetic response would have been to conditions localized and particular to himself -- the attacks by Mars would have been experienced in his lifetime. De Grazia suggests a composition date of 650 BC.

From the terse information of the Maya *Chilam Balam* we know there were five close passes by Mars between 747 BC and 687 BC (at 15-year intervals). But, from the same source, we know that there were a total of nine contacts, thus there were an additional four passes before 747 BC, starting in about 806 BC, also at approximately 15-year intervals. Some locations likely were only touched once.

The condition of a gigantic arc traveling across the surface of the Earth would have been distinctly localized, although the fall of airborne debris could have covered large areas, and the earthquakes would have spread even further away from the path of destruction. What is peculiar, but not unexpected, is that in some instances the same locations were struck repeatedly.

Only after rereading the essay by Ralph Juergens's "Moon and Mars" did I realize that Mars would most likely have approached to within the plasmasphere of Earth, thus within a distance of 20 Earth diameters -- 160,000 miles (250,000 km). Juergens suggests a relatively close distance for the Mars and the Moon interaction (neither has a sizable plasmasphere). Patten and Windsor suggest 27,000 miles for the closest approach to Earth (based on damage due to gravitational attraction). Maya iconography suggests a lightning tail extending from Mars by 4 or 5 diameters -- thus a distance of 21,000 miles (34,000 km) from Mars to the surface of Earth. [\[note 6\]](#)

At a surface-to-surface distance of 20,000 to 30,000 miles, Mars might have lifted the Earth's crust below its path, creating (as Patten and Windsor claim) ridges of mountains. The Earth crust which was lifted would not have subsided back entirely, since the land area of the Earth is only material floating on a heavier substrate, and this last would have filled the hollow left below the lifted mountain ridges. Mars could have remained in place laterally next to Earth perhaps for some days, since in crossing Earth's orbit it would be traveling at nearly the same speed as the Earth. However, since the Earth rotates, the arc below Mars would have moved past at some 500 miles per hour (800 km per hr) at a latitude of 30- to 40-degrees. Near the equator the arc from Mars would move at supersonic speeds -- on the order of 1000 miles per hour. [\[note 7\]](#)

Patten and Windsor suggest any number of curved north-south mountain ranges as being due to the lifting forces of Mars, including the Andes and Rockies. I am not in agreement with a north-south path for Mars, since, as a planet orbiting the Sun, it could only approach Earth laterally although this could happen at any latitude, and would be nearly the same latitude each time. Patten and Windsor hold that the orbits of Earth and Mars were coplanar. This is not correct. The only requirement for Mars to show up near Earth is for Mars's orbital path to cross Earth's orbit close to Earth (and, of course, for Mars's perhelion to be within the orbit of Earth).

Under such a condition, with both planets at almost the same location from the Sun, both would be traveling at nearly the same speed. Even though nearly standing still, Mars would seem to fly by as the Earth continued to spin. This might have taken a number of days.

I disagree with the Patten and Windsor notion of "crescent shaped" mountain ridges. Any ridges which were formed in this process of a close approach would have been almost entirely parallel to the Earth's latitudinal lines. That also means that Mars was seen in a side view, that is, with the rotational axis of Mars directed more or less parallel to the Earth's axis, and seen as rotating.

All indications from references in antiquity is that Mars represented a distended and distorted image -- perhaps wildly flailing like a bat, which is how some Mesoamerican sculptures represent Mars. In Europe, Asia, and China, Mars is represented as a dog, a wolf, a sword, a gruesome giant, and a diseased person. The shapes of the imagery are likely the Martian dust extending into the Earth's magnetosphere. The diseased look probably derives from the pockmarked lower hemisphere. Mars is frequently noted also for its bloodstains and fire. The fire is sand and dust brought to flaming incandescence at Mars or the Earth by the arc between the planets.

The center of the Aztec "Calendar Stone" shows a face with a tongue lolling out. This is Mars. The same tongue appears on images of the Gorgon of Greece, the dreadful snake-haired woman whose gaze would turn to stone anyone who looked (although this image dates from 10,000 years earlier). Add together the snakes, the tongue, the Mesoamerican mention of Mars smoking a cigar (only seen as such by cigar-smoking Olmecs), or with a smoking celt lodged in his forehead, and you end up with a varied and frightening apparition flying by in the skies overhead. In Mesoamerica Mars is also described as carrying a smoking mirror on its forehead, which clearly is the northern ocean (or the remnant of the included deeper ocean, Deuteronilus) steaming water into space. The 13th century AD Icelandic *Younger Edda* also recounts Thor (who is Mars) with an axe lodged in his head after an encounter:

"Thor went home to Thrudvang, but the flint-stone still stuck fast in his head."

In passing over Earth's surface Mars would have induced an opposite charge below it. The result would have been a continuous lightning strike in an attempt at charge equalization. From the evidence of fire, the melting of metals, and the calcification of building stone, as at

Troy (Hisarlik), Pylos, and numerous other places, it would seem that Earth was the anode for the lightning strikes.

This is exactly how lightning occurs under "normal" conditions today: negatively charged clouds chase away electrons at the ground below the clouds, resulting in a higher potential difference, which leads to lightning strikes. And like a "normal" lightning strike, the Earth's surface would have been the anode in the strike.

But the passage of Mars is also (or especially) noted for fire, and flames of extreme temperature. An electric arc would certainly qualify, but more likely, it was the dust ionized and ejected from the arc contact point -- burning sands, as Isaiah at one point suggests. Disassociated silicate dust, generated at Earth's surface and ionized as cations.

At Mars the plasma stream was possibly as wide as the planet -- 4000 miles (6400 km) diameter. This is the dimension of the limited plasmasphere of Mars, the small size resulting from lacking a magnetic field and an atmosphere. Within the plasmasphere of Earth, Mars would only have sported a limited plasmasphere, with a double layer perhaps a hundred miles above the surface, and constituted entirely of ferrous and ferric cations (Fe^{2+} , Fe^{3+}) plus the requisite electrons as the negative charges. At the Earth's surface the stream of plasma would concentrate to a much smaller dimension, possibly only tens of miles wide -- and in arc mode. [\[note 8\]](#)

The lightning strikes of the 8th and 7th centuries BC traveled west across the surface of the Earth (because Earth rotates to the east). The lightning strikes may have ignited, extinguished, and restarted numerous times, preferring high ground to land on. The lightning bolts must have been enormous and mostly continuous. The bolt would probably be seen coming from over the far horizon, for in a number of instances we have evidence of people evacuating hilltop locations only minutes before being struck. At Pylos we have written records (clay tablet) of "watchers" posted at the shoreline. To no effect: Pylos was utterly destroyed.

The arc would have resulted in hurricane level forces which tore apart city walls and buildings. As a continuous arc, the bolts would have left behind a path of incinerated trees and grasses and upturned soil. And the arc would have been surrounded by a circular magnetic field which would lift up most of the debris and ashes and send it swirling up. This is how a tornado operates. Tons of loose soil and ashes would have been lifted into the air. The lightning bolt would linger or slow at a hilltop citadel rather than increase its resistive conduction path in leaving a hill. If the bolt stopped or extinguished on a hilltop, the suspended material would have been dropped. That is how Hisarlik got covered in a four- to six-foot layer of burned material.

If the lightning bolt was tens of miles across, the flaming sand would have spread horizontally from its base to a width of perhaps a hundred miles (160 km). Michael Steinbacher has reported that in the southwestern United States, at about 30 degrees latitude,

there are gullies running up mountain slopes where the tops have been metamorphized -- altered physically and chemically by heat. It is clear that if flames of ionized sand were forced up these gullies they would concentrate to a greater temperature where the width of the gully decreased. Dennis Cox has made note of top ridges of mountains in northern Mexico which have been melted, and similar metamorphic damage in Texas and Colorado. Let me quote Cox from [\[sites.google.com/site/dragonstormproject\]](https://sites.google.com/site/dragonstormproject/)):

"There are tens of thousands of square miles of assorted ejecta, and breccias, and of rivers of melt, and pyroclastic materials in Northern Mexico. All in pristine, unweathered condition like they only happened yesterday. And if you follow those materials upstream back to their respective sources you find no volcanoes, and no craters, only bare patches of smoothly melted stone. Or miles-wide, irregularly shaped melt basins, or strangely shaped denuded mountains with all traces of alluvium blown away. And which, sometimes, in their undulating lines, and angular scale-shaped ridges, look for all the world like the spine of a dragon sleeping in the earth."

Cox assigns the causes to meteors, and thus talks of objects cast down from the skies. Close enough for identical effects. He continues:

"... almost all of the object's kinetic energy gets translated to heat. The heat hits the ground in a supersonic, hyperthermal downdraft of perhaps millions of degrees. Most of the time even the detonation shock wave itself gets transformed into the heat. But here is no missing energy. And it doesn't 'dissipate harmlessly' in the atmosphere. The mountain is still history; it just very quickly, and violently, melts and goes away. Think about a gust of wind so hot that it instantly makes granite flow like water, and is just another gust in a turbulent storm. Then realize it's not imaginary. Such things have happened in the recent past. There are mountaintops at 13,000 feet (4300 meters) elevation in the Rocky Mountains of Colorado, their glacial ridges melted, blasted, and blown over the ridge top in runnels of melt, like wax on the sides of a candle. And recent enough that the blast melt materials have never been subjected to the grinding action of a glacier. Or mountains in Eastern Texas softened and tossed around like waves in an angry sea."

Mars came close enough to Earth to have its two close satellites observed and described. Both are very small and they circle Mars on extremely tight orbits. To Homer they are Ares's dogs of war, Deimos and Phobos -- Fear and Panic -- rushing madly about his chariot. Hesiod says they are the horses of his chariot. Dean Swift describes the satellites of Mars quite accurately in *Gulliver's Travels* (1726), apparently on the basis of sources from antiquity, for they are only discovered by telescope one hundred and fifty years after its publication.

[\[note 9\]](#)

In the *Iliad*, Ares, "the bloodied stormer of walls," always loses. Yet a number of belligerent nations take Mars as their primary God. Mars is the chief God of Rome. Their calendar year starts with the month of March in his honor and the founding of Rome is dated to the middle years of the eighth century BC -- coincident with a major disturbance of Earth by Mars in

747 BC which altered the length of the year. The Cimmerians and Scythians, Eastern European steppe peoples, also take Mars as their chief god and start destructive raiding expeditions into Anatolia in the 8th century BC. In the middle of the 8th century BC, coinciding with the return of Mars, Assyria, a small nation in Northern Mesopotamia, models its army after Mars's "horse mounted" hordes, and with similar tactics of speed and utter destruction, expands its conquests over a region from the Persian Gulf to the Mediterranean and to Aswan in Egypt.

The Aztec's chief god is Huitzilopochtli, "destroyer of cities and killer of people," and the Aztecs proceed (at a much later date) to terrorize the other nations of Mexico. Huitzilopochtli is Mars. (There are other Mesoamerican gods associated with Mars, such as the "flayed god" and the "scarfaced god.") [\[note 10\]](#)

Mars caused a disturbance of the Earth's orbit on February 26th, 747 BC. A second significant disturbance happened in 686 BC, on March 23 (some catastrophists suggest 702 or 701 BC). But this second shock was due to Mercury, not Mars. Subsequent events verify this notion. [\[note 11\]](#)

The events of 747 BC and 686 BC stand out, for the Earth experienced a seismic shock and the axis of the Earth was disturbed. During the gyroscopic reaction which swung the axis through a loop, the day was temporarily lengthened or shortened. In the *Iliad*, Hera sends the Sun unwillingly into the ocean, that is, she is shortening the day. In the *Odyssey*, Athena holds back the dawn at the edge of the ocean, thus lengthening the night. [\[note 12\]](#)

Two Planets in line with the Sun

[Image: Two planets in line with the Sun. When the inner planet's plasmasphere tail, directed away from the Sun, intersects the leading edge of the other planet's plasmasphere there will be an electric interaction. Illustration by J. Cook.]

The reaction to having the plasmaspheres of two planets touch would be the sudden experience of each other's electric fields. This would result in an instantaneous repulsive force -- an Earth shock. As the planets would both move away from each other (in the

direction radial to the Sun), the force would decrease, and stop as the planet with the larger negative charge would induce an opposing charge in the facing hemisphere of the second planet. Since this involves the movement of electrons through the crust or atmosphere, it would take some time, perhaps minutes, or even only seconds. The reversal of electric field would result in an attractive force between them, enough certainly to halt the movement away from the Sun. The increased difference in charge between the planets also would result in arcing from one to the other in an attempt to achieve charge equalization. [\[note 13\]](#)

Because of the initial repulsive electric force, the crust would be depressed over a large area, resulting in an uplift at the margins. As the Earth rotated, the center of the compressive forces would rotate toward the west or southwest but would diminish very rapidly with the change of the induced charge to an opposite value.

The shock would be transmitted to all of the globe of the Earth, and would both move the Earth in space, and, if the center of the impact was off-center to the Earth's equator, it would tilt the rotational axis. A gyroscopic reaction torque would result if the Earth's axis tilted -- a second twist which would attempt to bring the Earth's axis back to its original position. The Earth's crust might react to the initial shock for a long time. Mesopotamian records indicate earthquakes on an almost daily basis during these two centuries and, even four hundred years later, Rome still records over 50 earthquakes per year. (See Appendix B, "Celestial Mechanics" for the mechanics of the interactions.)

Calendar Reforms

After the Earth shock of 747 BC, the year lengthened by five days, six hours, and 20 minutes to become 365.24 days -- nominally a change of 5 and 1/4 days. Calendar reforms were instituted worldwide, some in 747 BC but a few much later. Egypt attempts an additional correction to the calendar in 239 BC when the priests issue a decree which added one day to the civil calendar every four years. [\[note 14\]](#)

"... that the case shall not occur, that all the Egyptian festivals, now celebrated in winter, shall not be celebrated some time or other in summer, on account of the precession of the rising of the Divine Sothis by one day in the course of 4 years."

-- *Canopus Decree*, 239 BC, found at Tanis.

However, the previous Egyptian Venus calendar, based on the heliacal rising of Venus (Sothis in this case) every 8 years, remained in use until Julius Caesar's calendar was introduced 200 years later under Roman occupation. [\[note 15\]](#)

Between 2193 and 1492 BC there probably were ten lunar months of about 28 days in the year. Shang dynasty oracle records indicate months of 27 and 28 days. I have used a year of 270 or 280 days for this earlier period, which I think it was probably 273 days. This is reason

enough why Shang records use both 27-day months and 28-day months.

In the following era, from 1492 BC to 747 BC, the year was 360 days, and the Moon on an orbit of 30 days. Both of these periods are well established. Many people, however, kept to the ten month year of the previous era, and made correction in a number of ways.

When, after 747 BC, the period of the Moon (the month) was no longer a whole-number interval of the year, the religious feast days started to wander around the year, and efforts were made throughout the world to rectify this. Here is a list of how the ancients took notice of the new celestial order of 365 and one-quarter days:

- On February 26, 747 BC, Nabonassar, king of Babylon, introduces a new calendar and an era called "the Era of Nabonassar." This dating schema is used to start compiling a yearly account of activities called the *Babylonian Chronicle*. Ptolemy (circa AD 150) and later astronomers would continue to use this astronomical record into the 15th century AD. Ptolemy also published a 900-year list of Babylonian kings up to his time using the *Babylonian Chronicle*. [\[note 16\]](#)
- Ptolemy uses the dates derived from the *Babylonian Chronicle* for a compilation of lunar eclipses (based on records obtained by Alexander in 331 BC from the Chaldeans), and marks 747 BC as the starting year of the collection, with the first eclipse in 721 BC. It is not certain if earlier records existed, but before 747 the skies were different, and earlier records would be invalid. China starts a record of eclipses at about the same time. [\[note 17\]](#)
- In the previous period, 1492 BC to 747 BC, the Earth year was 360 days and there were 12 lunar months of 30 days. When the number of lunar months changed to slightly more than 12 after 747 BC, a considerable number of people in the world retained the 12-month lunar calendar of the previous era, which ran about 11 days short of a full year, and made adjustments by periodically repeating one of the months. Some of these calendars have lasted into the 20th century AD. [\[note 18\]](#)
- The founding of Rome is dated to 747 BC, the year of the major disturbance of Earth by Mars. Probably long before 747 BC Rome had added two months (January and February) to their original ten-month lunar calendar (dating from before 1492 BC) and set all the months to 30 days, corresponding to the 30-day lunar month of the then-current era. (King Numa, who supposedly arranged this, is a fiction, and all the early records of Rome were destroyed by the Celts.) With the changes of 747 BC, the solution for the Romans was to end the year on February 28th (starting the year on March 1, the month of Mars), abandon lunar months in favor of calendar months, and distribute the extra days of the year equally among the remaining 30-day months. The change to starting the year on January 1 happened 700 years later after Julius Caesar's calendar reform of 40 BC. Appointments to the office of Consul already started on January first a hundred years earlier. [\[note 19\]](#)
- An interval of 4 years, called an "Olympiad" had become the standard of chronology among the Greeks. The Olympiads were counted from the first Olympic Games in 772

BC (four years after the so-called 'ballgame' of 776 BC; see below). The four-year cycle used for the Olympiads is actually based on the coincidence of the synodic periods of Venus and Earth. Five complete orbits of Venus (as seen from Earth) are equal to eight complete orbits of Earth (at that time). At the end of eight Earth years Venus would rise again in the east against the same background stars, and of course on exactly the same calendar day as eight Earth years earlier. Both the convenient halfway point of four-years and the full eight-year cycle of the "Venus calendar" were observed in Greece, Egypt, Mesoamerica, and South America. With the change of 747 BC, the four-year interval fell one day behind each Olympiad. [\[note 20\]](#)

- Five days were added to the Mesoamerican calendar of 360 days, before the end of 747 BC, and were known as the "Sleep of the Year". The same addition to calendars happened in almost every nation around the world, from Peru to Rome, and also to the Egyptian "civil" calendar. The Peruvian calendar included a leap day every four years to account for the quarter day left over at the end of the year. The Egyptian and Mesoamerican calendars did not account for the extra 1/4 day. [\[note 21\]](#)
- The "Long Count" was initiated by the Olmecs on February 28, 747 BC, with the count of double-decades, years, months, and days all set to zero. The "years" are 360-day years (18 "months") where the "month" is 20 days long. A larger measure, the Baktun, consisting of "400-year intervals," was set initially at 6. This is "6.0.0.0.0" in Long Count notation; see "The Maya Calendar" for details. The Long Count continued to be used by the Maya until AD 900. [\[note 22\]](#)
- The Maya considered that all pre-history happened in a Katun named "11-Ahau," which is named after the name of its last day. In the *Chilam Balam* there are a number of lists of events which always start with Katun 11-Ahau. Significantly, a Katun 11-Ahau ended on February 28th, 747 BC (Gregorian), when the Long Count calendar was started. The concept of assigning all prior history to Katun 11-Ahau may have its origin with this start of the Long Count. Katuns were named and likely were counted prior to this date. [\[note 23\]](#)
- The contemporary Maya of Chiapas, Mexico, still retain the use of the Haab calendar of remote antiquity, and start the 5 intercalated days (the five extra days added to the 360-day year) on February 26 of our calendar. The year thus ends after February 26.
- The Romans in effect did the same thing with the pre-Julian calendar, ending the year in mid-February, but used a 365-day year: *"February was split into two parts, each with an odd number of days. The first part ended with the 'Terminalia' on the 23rd, which was considered the end of the religious year; the five remaining days formed the second part."* -- Wikipedia
- Tedlock reports that among the Quiche Maya of Guatemala the arrival of a new solar year is celebrated on February 25th, two days early from the Chiapas calendar.
- February 26th, the day of the disturbance of 747 BC, was celebrated as the start of the year (New Year's day) among the Aztecs at the time of Cortez. [\[note 24\]](#)
- At about this time, China declares that there are now 365.25 "degrees" in a circle. We do not know for certain when this practice started, since all books were burned in 213 BC. But it was certainly in use by the first or second century BC. It did not turn out to be

convenient in geometry, but worked fine for celestial navigation on the seas. It was still in use in the 15th century AD.

Before 747 BC there had been 12 lunar months of 30 days during a year of 360 days. Since, during this period, an exact multiple of lunar months coincided with the solar year, lunar calendars were in use universally to govern the dates when religious observations were to be held, but many of these counted ten months to the year as their calendars had before 1492 BC. The phases of the Moon would represent a very visible public calendar, which everyone could understand.

The change to a new year of an odd number of days and a fractional day left over, and with a month no longer composed of an even fraction of the year, brought religious observances into total confusion. Attempts at corrections were made worldwide, resulting in many very complex calendars. All of these reforms we are aware of are obvious attempts to bring a lunar religious calendar into conformity with a new solar year, because following a strict lunar calendar during the new era would continuously displace all celebrations by many days over the year.

It should be noted that there is worldwide disagreement on which day constituted the start of the new era. As Hera sent the Sun into the ocean, shortening the day in the Mediterranean region, the Indians of Mesoamerica experience a night which lasted four nights -- thus equal to two full days. Just as in the Mediterranean region we have the Era of Nabonassar starting on February 26th (after nightfall) and the Roman calendar starting after February 28th (the changes to new calendars were independently arrived at), so in Mesoamerica we have a similar disagreement over when the new era started.

In the case of Mesoamerica, the question of dates has become an issue among scholars, and deals with the retrocalculated initial date of the Maya (Olmec) Long Count. John E. Thompson first suggested in 1927 that the Maya Long Count of days starts on August 13, 3114 BC. In 1935 Thompson revised his calculation to August 11, validating the opinion of other scholars who had arrived at a date of August 11, 3114 BC.

This last date (the "August 11" starting date correlation) has become the accepted archaeological standard and is generally used today, although any number of researchers think that the date of August 13, 3114 BC, is more likely to be correct, because a calendar based on August 13 correctly dates many known recorded eclipses. A calendar based on August 11, however, is still used by some people in Mexico and Guatemala. [\[note 25\]](#)

There have been suggestions that the Maya made a two-day correction at some time in the past, but this assumes an absolute and uniform use of the calendar since remote antiquity. Considering the widespread adoption of the Olmec religious practices among the diverse tribes of Southern Mexico, the Yucatan, and Guatemala, as well as the universal use of the (now) 4300-year old Tzolkin calendar, it can be assumed that in 747 BC, when the Long Count was devised, there were some diverse regional opinions on the concept of where one

era ended and another started, as well as questions about the existence ("completion") of two days which had not been seen in progress.

A Blast From Heaven

Another strange incident at the time of the last disturbance (the second Earth shock in this era) was widely known in the Middle East. In 687 (or 686) BC the Assyrian army of Sennacherib, on its way to quell a revolt in Egypt, camps some distance from Jerusalem and demands its capitulation on threat of a siege. The prophet Isaiah urges Hezekiah, the king of Jerusalem, to resist, telling him that Sennacherib's army would never arrive. Apparently Sennacherib had been similarly warned by his advisors. [\[note 26\]](#)

"The very same night God sent his angel to their camp. He destroyed every man of valour, every commander, and chief man in the Assyrian army. The next morning there were found 185,000 dead men. After this Sennacherib shamefully broke camp and returned into his own land to rest at Nineveh."

-- paraphrased by Bishop Ussher

Since antiquity there has been endless speculation as to what really happened, starting with Herodotus (fifth century BC), who attributes it to mice. Josephus (first century AD), along with modern historians, suggested a plague. But Biblical and Egyptian sources plainly state that it was *Ignis Coelis* -- "a blast of fire from the heavens." Such would be one of the effects of an electric interaction with another planet. [\[note 27\]](#)

There are two independent records of this event from China. The following is quoted from the *Bamboo Books*:

In the tenth year of the Emperor Kwei, "... the five planets went out of their course. In the night, stars fell like rain. The earth shook."

-- *Annals of the Bamboo Books*

The *Bamboo Books* were found in China in a grave in AD 279. The *Spring and Autumn Annals*, compiled for the state of Lu by Confucius and completed about 480 BC, reads almost identically, but does not recognize the Earth shock.

"In the seventh year of the Duke [Chwang] ... In summer, in the fourth month, on Sin-maou, at night, the regular stars were not visible. At midnight, there was a fall of stars like rain."

-- James Legge, translator, *The Ch'un Ts'ew and The Tso Chuen* (1872)

The seventh year of the Duke Chwang of Lu is identified as 686 BC by Legge. The quote from the *Bamboo Books* lists the date (-687) in astronomical notation, which is equivalent to

686 BC, Julian. [\[note 28\]](#)

[Image: Mercury in 686 BC. The separation was 50,000,000 miles (80,000,000 km).
Illustration by J. Cook.]

These terse Chinese historical notes, which have been dated to March 23, 686 BC, can be interpreted as a swing of the spin axis of the Earth as it underwent a gyroscopic reaction to an external torque induced by the Earth's plasmasphere contact with the plasmasphere of another planet. The other planet, in this case, was Mercury -- not Mars, as every researcher expected.

The first effect of the sudden electric repulsive force experienced from Mercury, as the plasmaspheres connected, was a shock felt worldwide. The stars would seem to fall, or, on the day side of Earth, the Sun would move away from its normal path.

Sennacherib returned to Assyria, did not record this nighttime disaster (or the campaign) among his records, and spent the next 8 years in seclusion. Two of his sons kill him while he is at prayers in the temple of Nergal (Mars).

There was an Egyptian monument in the eastern delta (at Letopolis, "Mouse City," also known as the "City of the Thunderbolt") to a "mouse god" (per Herodotus), erected in commemoration (apparently) of the defeat of Sennacherib's army which had left Egypt in 686 BC (or never reached Egypt). There are also extant temple inscriptions bearing on this.

I would suggest that it was Mercury which was involved in the incident of 686 BC. Mercury is Hermes among the Greeks, but known as Smintheus or Apollo Smintheus ("Apollo of the mouse") in Asia Minor at the time when Mercury was still known as Apollo, the Archer God, among the Greeks, as in the *Iliad*. The name Apollo was transferred to the Sun at a later date.

Mercury, although today only a little larger than our Moon, possessed an atmosphere in antiquity, and would have looked maybe four times larger than the Moon. Always in the

company of Mars, and traveling only some 180,000 miles above Mars (the Moon is at a distance of 250,000 miles), Mercury would have loomed large in the sky.

It certainly might have looked like a mouse with its plasma coma and plasmasphere tail, just as it might have looked like a bow and arrow with its bow shock and tail. Although the date, supposedly March 23, 687 BC (Julian), would seem to argue for Mars as the agent, a second Earth shock by Mars is not at all well supported. I would opt for Mercury as the agent, and I would place the event in 686 BC rather than 687 BC. For more information bearing on this see Appendix B, "The Celestial Mechanics."

The Earth shock was experienced at night in Peking and Jerusalem. Chinese sources read "at night" as does the Bible. Although Mercury was not seen during the daytime in Asia or the Middle East, it was seen by North American Indians in the daytime. The impact can be located in Northern Alabama and shows as a circle of mountains.

To paraphrase from various legendary North American Indian sources, this is what transpired:

The Sun was in the day sky at about noon when it turned black and started to move down, that is, moving directly toward the horizon and additionally toward the southeast. The Sun was choking, and as it dipped down in the sky, the sky darkened and Coyote (Mars) was noticed in the east. Coyote had just crossed over the Earth's orbit in the last few days. Obviously Coyote had snared the Sun, and was dragging it backwards. Only after an hour did the Sun brighten again and return to its path across the sky. Then it was seen what had happened. A mouse had chewed through the lasso. It could still be seen just west of the Sun, with its tail pointing away. [\[note 29\]](#)

The tale of a mouse in the sky is known throughout the world in various forms, as De Santillana and Von Dechend point out in an appendix to *Hamlet's Mill*. Some of these are not accurate for an involvement with the Sun, however. Most of the daylight during this incident spread only from far Western Europe to the middle of the Pacific. Thus tales of winged mouse Gods from India are suspect. The Polynesians have myths dealing with a rat God that gnawed through the nets of the Pleiades. Mercury was within a few degrees of the Pleiades on March 23, 686 BC. This is correct if it is considered that at this time the dome of the stars had not yet shifted (that would happen in 685 BC) so that the Sun stood directly below the Pleiades at the spring equinox.

As I have previously noted, this event also represents the Tower of Babel incident: a plasma cone in glow mode extended from Earth to Mercury and ignited Mercury's atmosphere. The plasma connection may have lasted a day or more. In that case, everyone saw it, and certainly everyone saw the flaming planet. The reason this story is known worldwide is because it came so late in the history of antiquity. The loss of memory and speech may have been associated with this specific incident, or may reflect the changed condition of the Sun's electric field the following year. More on this last later. [\[note 30\]](#)

The Death of Quetzalcoatl

The shock which cast Mercury into an orbit close to the Sun may have changed the eccentricity of Earth's orbit (which would not change the length of the year but would allow for a required change in Kinetic Energy), because soon after the encounter with Mercury, Earth seemed to have moved its orbit away from intersecting the orbit of Mars and was thereby removed from the threat of Mars. Shortly after Earth was removed from the vicinity of Mars, Venus, too, fell from the sky. [\[note 31\]](#)

"How art thou fallen from heaven, O Lucifer, son of the Morning?"

-- Isaiah.

What happened to Venus? From what little we know, it looks like Venus was suddenly involved in a massive plasma discharge. The discharge also involved Mercury. But less notice was taken of Mercury, for at the start of the nova event Mercury was very close to Venus in the sky. Most peoples recognized Venus, but not Mercury. The starting and ending dates of this event are developed in the chapters "Modern History" and "Olmec Alignments." [\[note 32\]](#)

In Mesoamerica, Quetzalcoatl, who is Venus, is represented as the bearded man or God, who had come from the east to deliver all the benefits of civilization. In their recycling of all history, the Mesoamericans make Quetzalcoatl into the last king of the abandoned and famed city of Tula, already an ancient ruin at the time of the Mesoamerican authors of the 15th century AD. To paraphrase, "Quetzalcoatl, the last King of Tula, traveled east, and set himself on fire. Eight days later he arose in the sky as the Morning Star (Venus)." Both the *Popol Vuh* and the *Annals of Cuauhitlan*, two documents independently written a thousand miles apart, agree on this. In the *Codex Borgia* the mythical hero Quetzalcoatl is burned while his heart ascends to heaven as the Morning Star. [\[note 33\]](#)

The "burning of Quetzalcoatl" happened far from Earth, since it did not involve any noticeable geological disturbance on Earth, although we have many notices of the "Ignis Coelis" during this period. It may very well be that the condition of electric charge for Venus had mounted to the point where only a plasma discharge or a mass ejection could balance forces. At any rate, after its last passage behind the Sun in 680 BC (in eastern Mediterranean chronology), Venus seems to have undergone a massive plasma discharge, and, at some later time, assumed a circular orbit. It must have been an enormous energy outpouring, for Venus lost its coma, its talons, its feathers, and its flowing hair. It assumed the looks of a star. But it took months.

If, as I have suggested, Mercury was involved in the March 23, 686 BC, plasma contact with Earth, then it might also be suggested that we are not seeing Venus involved in a nova event, but that this was a nova-like event of the Sun, involving Mercury and Venus. When Mercury

changed its orbit to fall well within the orbit of Venus, it disturbed electric conditions close to the Sun. Today the Sun still reacts to comets which come close by hurling coronal mass ejections toward them into space. That would make more sense of the description, from China, that two suns were seen battling in the sky at this time. The two Suns do not imply that one of them was the actual Sun. But since Mercury remains close to Venus at first, and within a month was close to the Sun, it is certain that for many observers the display involved only Venus and the Sun. The sudden brightening of Venus was recorded in extensive references to "a prodigy in the sky" and of Venus "blazing through the day sky brighter than the Sun," as well as references relating to the changes in the sky. [\[note 34\]](#)

We do not know exactly when this happened, but my suspicion is that it occurred during the year 680 BC in Eastern Mediterranean chronology, which is 685 BC in absolute astronomical chronology (to be discussed below). There are a number of reasons why we have no certain date for this event. First, because the blazing of Venus spanned a considerable amount of time. It was not an event lasting only a day. In fact, it lasted a month and a half, 40 days. Second, the event was not associated with any cataclysmic changes on Earth. And third, the effects were not noticed until the following year, or later. Only later were the lasting changes recognized: Spring started two weeks later, the constellations had moved in the sky, and the polar axis no longer pointed to a location in Ursa Major. When later attempts were made to understand the changes, it came as a massive shock to ideas about the Gods, about knowledge, and about the workings of the Universe -- which will be the subject of the following chapter.

The blazing planets must have represented a cataclysm equivalent to a supernova. The event should have been noted in Chinese records as a nova. It was not. The earliest Chinese record of a supernova (a "guest star") is for AD 185. The eruption of Venus was not considered a "guest star" because although the display was immense it happened during daytime. It was not a star, it was obviously the planet Venus, which, because of its coma and tail, would have readily been seen in the daytime in antiquity, and the planet Mercury.

For both the Mediterranean region and Mesoamerica, the blazing of Venus became the end of mythical and divine history. No new Gods enter the pantheon after this -- with the exception of the personification of Venus as the savior of mankind as Quetzalcoatl, Mazda, Mithra, and Christ.

When Venus and Mercury started to blaze in the skies, it must have seemed as if the end of the creation was at hand. But it ceased, on July 25th, 680 BC (685 BC), suddenly, when a massive plasmoid lightning bolt by Jupiter stopped the blazing planets. I'll discuss this in the next chapter.

The Ballgame

In the 8th century, not only did Mars come close to Earth, but on at least one occasion this

happened at the same time that Venus was "near Earth" -- but only visually so. This was 700 years after the post-Exodus date of 1440 BC. Venus was seen streaking across the daytime skies and this event was recorded, apparently in 776 BC, but only because Mars also appeared near Earth at the same time, making it look like the planets were in a race.

Venus could not have come close to the Earth without causing the complete destruction of the Earth. Venus, a much larger planet than Mars, with a very large coma, might have looked perhaps half the size of the Moon if it was seen from 10 million miles (16 million km) away. (The Moon is only a quarter million miles away.)

Thus both Venus and Mars were seen on the day side of Earth, and the two planets seemed to chase each other across the sky towards the west (due to the Earth's rotation). If Mars passed Earth at a distance of one-quarter to one-half million miles, Mars would have looked the size of the Moon. Because Mars was much closer to Earth, it might indeed have looked as if Mars was gaining on or overtaking Venus. This may have played out over a number of days.

It has been suggested by Velikovsky that the Earth's Moon seemed to cross the path of the two planets (as if they were near) in its normal rotation around the Earth, but in the opposite direction. Velikovsky proposed that the Moon may have started to change its orbit in response to gravitational forces from three directions. That is totally unrealistic. Almost all imaginings of gravitational forces between planets, even if supposedly close together, completely neglect the absolutely overwhelming effect of the Sun in determining the orbits, and the role of forward momentum which simply does not allow a planet moving through space at 67,000 miles per hour (100,000 km per hr), as the Earth does, to diverge by even a fraction of an inch from its path.

Followers of Velikovsky identified the globes seen in the sky as a "ballgame" between Venus and Mars, with the Moon playing the part of the ball. The Moon was selected as the ball for want of any other likely planet, and the notion that the Moon is small. Problems with this identification are two-fold. First, the idea of a "ballgame" is a Mesoamerican notion, which is here being transferred to the Eastern Mediterranean, where there was no such thing as a "ballgame." In Greece it was a foot race instead.

Second, it is much more likely that Mercury played the part of the ball, although from Greek sources (the *Odyssey*) the Moon certainly was involved in an electric contact with Mars (but this was not the ballgame). Traveling faster than the Earth, Mars and Venus, or Mars and Mercury, eventually disappeared into the celestial east. This race, of course, was seen from the day side of the rotating Earth, so the planets would seem to be moving to the west.

[\[note 35\]](#)

The *Popol Vuh* records the interactions between One-Hunahpu and Seven-Hunahpu, the father and uncle of the celestial twins, Hunahpu and Xbalanque, as the "ballgame." The father and uncle here were Venus and Mars, most likely using Mercury as their ball. Mesoamerican balls were very large. Here there is a ball in play, since we are here among the

ball-playing Olmecs who invented rubber balls. In the *Popol Vuh* the father and uncle (as later with Hunahpu and Xbalanque) are said to travel west to reach the ballcourt of the Gods of the Underworld.

The exact year in the eighth century BC of this race between Venus and Mars (or the ballgame involving Mercury) has never been certain, although a date (780 or 776 BC) can be inferred from the date of the first Olympic Games in Greece which was in 772 BC. [\[note 36\]](#)

Venus and Mars may have met "near Earth" (visually) at other times in addition to 776 BC, for in 742 BC, Isaiah declared a prophetic sign "in the height above," to King Ahaz of Judah, saying:

"Behold, the Virgin shall conceive and bear a son, and shall call his name Immanuel ["God is with us"]. Butter and honey shall he eat...."

-- Isaiah 7:12-14

"The Virgin" is Venus. "Virgin" is a Greek translation of the Hebrew word "the maid" (Ha'almah, per Fritzius, below), that is, "young woman," as Isis/Astarte (Venus) had been known for 2500 years. The date of 742 was derived by Ussher.

Bob Fritzius contends that the "child" is Mars appearing from behind the coma of Venus, and moving through the tail. (He later disclaimed Mars, but offered no substitute.) It is actually Mercury, not in the tail of Venus, but visually behind Venus. See the website at [\[www.shadetreephysics.com/vel/ha-almah.html\]](http://www.shadetreephysics.com/vel/ha-almah.html).

A later addition to his webpage suggests that what may have been seen was an aborted fissioning of Venus (but I think this is suggested because the phenomenon cannot be tracked to any particular dated event from antiquity). Fritzius believes there is support for this from Greek mythology. Fritzius is a published astronomer and an electrical engineer, but has yet to find mythological support for this event.

There are some problems with the "Immanuel" prophecy. I cannot find anything in Greek mythology that refers to this except a very brief mention of the parentage of Phaethon (who is Mercury) by Hesiod, which Marinus van der Sluijs has pointed out in an article, and which I will address later.

I think the prophecy by Isaiah refers to 685 BC, not 742 or 747 BC. The "fissioning event" recalled in mythology is more likely a recollection of the blazing of Venus and Mercury after June 15 (Gregorian) of 685 BC (the astronomical year), when Venus and Mercury were visually within a degree of each other, but so bright that their comas seemed to merge. Over the following weeks Mercury would be seen moving away from Venus, as if Mercury had just been born. And this planet, smaller than Venus, and only recently relocated to an orbit close to the Sun, had not been seen in the daytime sky in the previous two years, and never

again after 685 BC. Mercury had lost its atmosphere the previous year when an Earth shock relocated it to within the orbit of Venus. Without an atmosphere Mercury, at one time looking nearly as large as Venus, had become much smaller. I think that this later element of 685 BC was written into the much earlier warning issued by Isaiah.

In Egypt Mars appeared as "Horus the Child" in sculpture at about this time (after about 750 BC), an inexplicable third Horus. This is possibly Mercury, although it is unlikely that the Egyptians misidentified Mars. The child Horus is originally shown trampling snakes and scorpions, and his image is a charm against snakebites and scorpion stings from the application of water run over the limestone image (as is used today also). He is soon depicted at the breast of Isis. (What a change in imagery!) This "Mother and Child" image spreads to the Middle East and the Roman empire, and eventually to Buddhist India through Greek influences, and is introduced to China. For the Egyptians of the New Kingdom, the second Horus had been assumed dead since circa 2700 BC (or after 1936 BC) when he last passed close to Earth, but at this time, in 747 BC, Mars is recognized again as Horus.

As noted above, Mars, when seen (at one instance) in the proximity to Venus, would look very small and the "Horus the Child" image may have derived from this comparison. The snakes being trampled are described in Vedic literature in the 7th and 8th century BC as contemporaneous companions of Mars. The Vedic hymns, as well as Bible passages and Mesopotamian documents, describe the furious rotation of Mars's satellites accompanied by moving plasma streams, looking like scorpions with waving tails. Vedic literature equates the satellites also with chariot wheels. This last places the description well after 1500 BC, in the age of chariots. The furious rotation of the satellites of Mars were in a direction transverse to the visual travels of Mars past the Earth. Once inside Earth's plasmasphere, the satellites would have trailed sweeping tails of plasma in glow mode, likely composed of the extensive dust of Mars.

Olmec sculptures of this era are of a full-sized adult jaguar or were-jaguar (a half human, half jaguar form), which probably represented Venus (although it may have been Mars), carrying a baby jaguar (depicted as a small adult) who also probably is Mercury.

In the Quiche Maya *Popol Vuh* of the 16th century AD we again meet these characters. The *Popol Vuh* takes liberties with history in order to come up with a smooth narrative, although the core of the narrative was well established nearly two thousand years earlier as can be seen from murals and inscribed scenes.

The hero twins, Hunahpu and Xbalanque, are clearly meant to represent Mars and Mercury, although by the story of their birth they would be Venus and Mars. But they are twins, and as twins most likely they are Mars and Mercury. The "twins" are a celestial phenomenon; a feature which occurs throughout the world at this time -- Italy, Greece, the Middle East, India, China, Australia, and Mesoamerica. Worldwide the twins are identified as black and white, with Mercury (yet with an atmosphere) as the white twin.

In the *Popol Vuh* one twin, Hunahpu, is identified by the Tzolkin day-name of the first day of the Venus cycle. (The *Popol Vuh* is a symphony orchestrated to the day-names of the Tzolkin.) The second twin's name, Xbalanque, could be translated from Quiche as "Little Jaguar of the Night." This is a transliteration from the notes of the book by Dennis Tedlock, *Popol Vuh* (revised edition 1996). Xbalanque is thus most likely Mercury.

In the *Popol Vuh* the appearance of Venus and Mars (although probably Mars and Mercury) a hundred years earlier (or at some earlier time) was understood to represent their father and uncle, who were put to death by the Lords of Xibalba, the Underworld. Both planets had simply disappeared into the night sky after some incident of the 8th century BC and not returned.

The activities of Hunahpu and Xbalanque are modeled both on the simultaneous appearance of Mars and Mercury in the 8th century BC and on the blazing of Venus and Mercury in the day sky in 685 BC (see later text).

During the various encounters of the 8th and 7th centuries BC, plasma interactions occurred between Venus and Mars, and between Mars and the Earth's Moon. These are described in the *Iliad* and the *Odyssey*. The *Homeric Poems*, which follow closely in time to Homer's epics, have similar descriptions. The *Iliad* retells the events of the 8th and 7th century BC as the interaction between the Olympian gods in the skies above Troy.

One event was an interaction between the warrior goddess Athena (Venus), and the bloodstained god of war Ares (Mars), with Aphrodite (the Moon) as a bystander. To keep Ares from aiding the Trojans in the battle of Troy, Athena drives a spear into Ares's "lower belly, below his belt." The scar still shows as a 3000-mile-long (4800-km-long) gash below the Martian equator. As Aphrodite approaches to help Ares, Athena bashes her in the breast. "And her heart bled [or melted]," reads the *Iliad*. [\[note 37\]](#)

Velikovsky notes that Roman historians for the 8th century BC record wildly erratic "months" which remain unresolved for a century. Despite the descriptions from the *Iliad* and the *Odyssey*, it is unlikely that the orbit of the Moon changed because of plasma strikes. Plasma strikes will wear away the crust of a planet before "moving" it in space. [\[note 38\]](#)

In the *Odyssey*, Demodocus, one of the fictional characters (and a poet), recites a poem dealing with a tryst of Ares (Mars) and Aphrodite (the Moon in this case). In this poetic interpretation, Ares's repeated arc mode plasma discharges to the smaller Moon are his ejaculations. Ralph Juergens mentions that, as Mars closed in, the display would have changed from long-range single arcs to much smaller arcs encompassing the whole sphere of the Moon. This last is the net devised by the smith Hephaestus (played by Venus) which falls on the lovers and holds them captive. [\[note 39\]](#)

Seen traveling across the daytime skies, and visually at close range, Venus is here known as the smith Hephaestus, a name which otherwise cannot be related to a planet. Alfred de

Grazia, in *The Burning of Troy* (1984), wrote about Hephaestus: "whose name Robert Graves says means hemerophaistos (he who shines by day)."

De Grazia also discusses at length what is thought to be the event, in *The Disastrous Love Affair of Moon and Mars* (1984), under the assumption that the love affair, which is presented in comic form, is a disguise for the actual terror it produced in the watching humans.

To put all of this together: Venus and Mars appear in the sky, Venus drives a spear into Mars, and bashes the Moon, a hundred years later Mars makes love to the Moon and is caught in a net. Suddenly in 772 BC the Greeks start up the Olympic games at a location as far removed from almost all of the warring Greek nations as can be imagined: the northwest corner of Peloponnesus. Although I have no idea what this really meant politically, it could be suggested that it was selected to be in the direction of the earlier contact point of a Saturnian plasma stream with Earth.

The Olympic Games in Greece were instituted in 772 BC (Wikipedia says 776 BC) to commemorate interactions between the planets Venus, Mars, and the Moon four or eight years earlier. Originally the games consisted of just one foot race. With each of the following Olympics at 4-year intervals, the activities were expanded to include additional races. Other types of athletic contests did not enter the Olympics until many decades later. [\[note 40\]](#)

We would need to ask, Why the celebration of the Olympic Games? It would follow directly from the logic of the ancients: that Mars showed the people what had to be done in his honor to avoid his wrath in the future. At least in the short run that was an efficacious solution, good for 15 years. Like recasting of the terrifying Mars and Aphrodite event as a comedy in the *Odyssey*, the "celebration" of the Olympic Games might be another anti-celebration of the experience of terror. The dating of the event to four-year intervals would bring Venus back into the same region of the sky as 4 years earlier, but not Mars. Venus was definitely a part of the celebrations. I should point out that the sequences of Olympic Games became the chronological base for all of Greek history.

In Mesoamerica the "ballgame" event receives an entirely different interpretation from the "foot race" in Greece. The Olmecs engaged in a game involving a large rubber ball. In Mexico the ballcourt comes into use, although possibly not until some 800 years later. The shape of the ballcourt seems to be based on the look of the equatorial rings in the south night sky at the time of the equinoxes before 2349 BC when the shadow of the Earth opened up the center of the rings as an inverted equilateral trapezoid. The ballcourts, which were ubiquitous in Mesoamerica and in use for 2000 years, consisted of two sloped surfaces between which a giant rubber ball was in play between contestants. In later versions there were enclosed end zones at each end of the alley, giving the overall plan view the shape of a capital letter "I."

We know nothing of how the game was played. I'll propose for this narrative that, when played ceremonially, the ballgame was the religious re-enactment of ball-playing twins

mentioned in the *Popol Vuh*; or perhaps the planet Venus and the Sun playing ball in 685 BC, perhaps with Mercury.

The ballcourt is a feature which came to be in near-universal use throughout Mexico and the game, in typical Mesoamerican style, was (apparently) a deadly affair. It is today suspected that the loser (or the winner, some say) was decapitated. It is also, as ever and everywhere in antiquity, in imitation of what was seen in the sky. [\[note 41\]](#)

The concept of a celestial ballcourt becomes an architectural feature of many (but not all) Mesoamerican ceremonial centers, at a minimum so that the ceremonial center and the setting location of the Sun along the horizon, become the two bouncing walls of the ballcourt. The ceremonial centers thus controlled the travels of the Sun. This is the case at Teotihuacan where there are no ballcourts.

Early excavators at the Olmec site of La Venta (900 BC to 400 BC) thought they had discovered a ballcourt (the area between two berms, directly north of the pyramid), but it turned out not to be so. One of the discovered sculptures, however, is still known today as "the football player." They did find rubber balls, to be expected, since the Olmecs cultivated the rubber tree. Apparently ballgames were played at La Venta and the earlier San Lorenzo (1450 BC to 900 BC), for sculptures of the gear and accessories have been identified. Additionally, the colossal heads found in the surrounding jungles all have "helmet" head wrappings, also suggestive of later ballcourt players elsewhere in Mesoamerica (but the original suggestion for this is based on American leather football helmets of the 1920s).

The head wrap may represent a means by which the Olmec people identified themselves with Mars, whose smooth upper half was seen on the close approaches in the 8th and 7th century BC, but this does not explain its use with the 10 heads found at San Lorenzo, which, as I will suggest later, most likely represent Venus rather than Mars. Of course in both cases (Mars and Venus) the planets jolted the Earth like a ball in play between contestants.

See also Linda Schele and David Freidel *Maya Cosmos* (1993), which discusses three ballcourts at the Maya site of Yaxchilan. The ballcourts were named "First Creation," "Second Creation," and "Third Creation," and have, in addition to the dedication date, appended time intervals pointing to earlier (or first) manifestation of these events (to which these ballcourts were dedicated), all of which can be placed, as suggested by Schele and Freidel, in the 7th century BC. And all of which are the wrong dates by thousands of years -- as a complete misreading of the information of the Day Books which were inherited by Yaxchilan. The historical references are to "creation" celebrations at La Venta, not to celestial ballgames.

The Winged Disk

During this period especially, from 806 BC and continuing a thousand years, we run into a curious iconography in Egypt, the rest of the Eastern Mediterranean, and on all continents: the winged disk. In Egypt we can date its first appearance as early as the Old Kingdom, and elsewhere in the Eastern Mediterranean from about 2000 BC. Most likely this represented the planet Mercury.

Velikovsky and others have pointed out that Mercury has a very long history of providing the names of kings. The veneration of Mercury became prominent, for example, around 2000 BC, and again in the 8th and 7th century BC. The Turin papyrus claims a longer life for Mercury than any other planet, dating it to the nova event of Saturn in 4077 BC.

[Image: Winged Disk, view of Mercury from an equatorial perspective; tail and bow shock not shown. Illustration by J. Cook.]

Mercury would have accompanied Mars on its excursions near Earth. Thus Mercury first showed up for 300 years starting in 3067 BC, then for an equal period starting in 1936 BC, and last for a 120 year period starting in 806 BC. In between these times Mars and Mercury did not cross Earth's orbit anywhere near Earth for more than 800 years. The start of the close calls are separated by 1100 years. The orbits of Mars and Mercury would have precessed away from Earth's orbit between these times.

Mercury had a magnetic field and an atmosphere, and therefore had plasma plumes at its poles. These would have pointed north and south as Earth passed Mercury, and would have been in constant motion. As the Earth turned toward the east, Mercury would have been seen traveling west like a flapping bird.

Endnotes

Note 1 --

The destruction was in fact much worse than presented here. Whole islands disappeared, others rose out of the sea. The destruction extended into Northern Europe. See in particular Velikovsky's unpublished documents at varchive.org, "The Dark Ages of Greece," the particular chapters [\["Changes in Land and Sea"\]](#) for Roman recollections, and [\["Closing the Gap"\]](#) for Greek, Egyptian, European, and Mesoamerican notes.
[\[return to text\]](#)

Note 2 --

During the 8th and 7th century over 300 cities in the Middle East were destroyed by earthquakes and fire. The Mycenaean Greek culture came to an end at this time (although conventionally dated 1200 BC). Mesoamerican farming villages, originally established after 1500 or 1200 BC, also suddenly disappear after about 800 BC.

In *Chaos and Creation* (1983), Alfred de Grazia writes about the book by Claude Schaeffer, *Stratigraphie Comparée et Chronologie de L'Asie Occidentale, IIIe-IIe millénaires* (1948):

"Certain outstanding events ... struck simultaneously a definite number or even the totality of urban centers of Western Asia. ... Not only is this conclusion persuasive as originally inscribed, but many locations can now be added to the doomsday list."

De Grazia notes the dates of about 2350, 2100, 1700, 1450, 1365, and 1235 BC, and adds:

"all that Schaeffer 'automatically' consigns to the end of the Middle Bronze Age, at around 1750 BC I assign to the same time, but dated at about 1450 BC. The many destructions that he consigns to 1200-1300 BC, I assign to 800-700 BC."

"The results are remarkable. Suddenly, the vast 'hiatus' between '13th century' destruction and 6th century proto-classical times becomes only a brief hiatus. It is clear that the vast movements of 'the peoples of the seas' were a fiction employed by scholars to explain the widespread natural disasters of the 8th and 7th centuries, the Mars disasters of our calendar."

In 1961 de Grazia contacted Schaeffer about updating the 1948 information. The project was cut short by Schaeffer's death.

The "people of the sea" are today held to be real by archaeologists, despite their admission that absolutely nothing is known about them, and there is virtually no mention of them in Egyptian records. I would suspect that the "people of the sea" are asteroids, comets, and bolides in the company of Mars. The sea, in that case, is the sky, even though the Absu had long ago disappeared.

But these could also be refugees from the northern regions devastated by Mars. Revisions of Egyptian chronology have moved the 19th dynasty 500 years into the future, resulting in a

coincidence of some of the "sea people" incidents (there are plenty of casual although unspecific Egyptian mentions) with the suspected overpasses of Mars. See, for example, to begin with, Immanuel Velikovsky, *Ages in Chaos* (1952), and following texts. Also see Jim Reilly, *Displaced Dynasties* (displaceddynasties.com, circa 2000).

De Grazia's suggested changes of Schaeffer's dates are only "more or less" correct for the lapses in chronology of the Eastern Mediterranean region. First, 2350 BC and 2100 BC can be left to stand for my dates for changes in the Earth's orbit in 2349 BC and 2193 BC.

Schaeffer's date of 1750 BC is 300 years earlier than de Grazia's date of 1450 BC (as representing the Exodus). I should note, however, that except for Schaeffer's collected data, there is little other indication of destruction anywhere else in the world. A considerable portion of the lack of backup studies of the archaeology of this era is designed to avoid confirming the theories brought forward by Velikovsky.

The dating hiatus of the Greek "Dark Ages" starts in about 1200 BC, when the last of the Mycenaean structures are today dated. Thus Schaeffer's dates of 1365 and 1235 BC are probably correctly moved by de Grazia to the period of 806 BC to 687 BC.

Patten and Windsor, in *The Mars-Earth Wars* (1996), maintain that Mars alternately showed up at the spring equinox and in October. I have included the alternations between spring and fall suggested by Patten and Windsor (but not specific to the spring equinox), but at an interval of 15 years, as initially suggested by Velikovsky, and as can be verified from the Maya *Chilam Balam*. This series makes much more sense in terms of Bible chronology, and especially the series of prophets who warned of these events. Patten and Windsor suggest that the length of the year changed in -701, but it is fairly certain that this actually happened in 747 BC.

The *Chilam Balam* is a collection of post-colonial (16th century AD) native manuscripts in the Mayan languages, using European script, which recorded histories and prophecies, many dating back with certainty for hundreds of years, while others recollect events dating back thousands of years before we have any archaeological inkling of the Maya.

Extending the close passes of Mars backwards from 747 BC (-747), give the following set of dates extending to 806 BC, based on the simple supposition of an interval of 15 or 14.5 years. At any rate, the change in the length of the year in 747 BC would not significantly alter these dates. This combines the suggestion of Patten and Windsor with what I have from other sources. (I have added the 686 Mercury event, and the 685 Venus and Mercury nova -- to be discussed later.)

If the last (and only) Earth shock involving Mars happened in 747 BC, then the current synodic period of Mars can be used with an ephemeris for the dates after 747 BC, since there would have been no further changes in the orbit of Mars, except for a change in ellipticity (which does not change the orbital period). That means that the "contacts" of Mars with Earth

before 747 BC might have involved only a slightly different synodic period for Mars. The last few calendar dates are accurate, and can be verified from Chinese and Mesoamerican sources. The "Sennacherib event" likely happened on March 23, 687 BC (Julian) and did not involve Mars, as an ephemeris will show. See endnotes of the following chapter for additional details plus Appendix B, "The Celestial Mechanics."

year Julian	date astronomical	notes
806 BC	Spring -805	
791+	Oct	
777	Feb -776	the 'ballgame'
762+	Oct	lesser violence
748	Feb 28 -747	Earth shock, year changes
733	Oct	lesser violence
718	Mar	
703	Oct -702	lesser violence
688	Mar -687	last sighting of Mars
additional data:		
687	Mar 23 686	Sennacherib; shock by Mercury
686	Jun-Jul 685	Venus and Mercury in nova

The archaeological record at Olmec La Venta only records the last five events, including 687 BC, although this might be the Earth shock by Mercury in 686 BC. The Guatemalan *Popol Vuh* also records a mythology of five close contacts. It is possible that Mesoamerica was differently affected by the first four contacts by Mars before 747 BC, since the Earth's orbit changed in 747 BC, although the archaeology of Central America records the disappearance of many villages in the 8th century BC.

I think it is the lack of Day Books based on the Long Count (which was instituted in 747 BC) that kept the previous four contacts with Mars from showing up in later transmitted records. The *Popol Vuh* thus only recounts details of the last five contacts recorded in the Day Books. [\[return to text\]](#)

Note 3 --

Mercury, which apparently accompanied Mars, and was known at that time as Apollo, also steals cattle. It is amazing that there are so many stories about the doings of Apollo, if indeed this planet was only seen on occasion and for very short periods at sunrise or sunset.

Velikovsky quotes from Vedic hymns and from Joel. Inadvertently many of the descriptions match plasma effects and interactions within Earth's plasmasphere of the asteroids closely following Mars.

The Maruts number seven, writes Cardona, from information gathered from Indian sources. Away from the mass of Earth the gravitational sphere of influence for Mars would have been about 400,000 miles (650,000 km) (100 times the diameter of Mars, per Van Flandern). This is twice as far as the Moon is from Earth, and well within the gravitational sphere of influence of Earth. We can only assume that the Maruts remained with Mars because their

velocity never matched the required speed needed to switch to becoming followers of Earth or to escape.

Note 4 --

Plato, in *Timaeus*, recalls what Egyptian priests told Solon:

"... you and your whole city are descended from a small seed or remnant of them which survived. And this was unknown to you, because, for many generations, the survivors of that destruction died, leaving no written word."

"For when there were any survivors ... they were men who dwelt in the mountains; and they were ignorant of the art of writing, and had heard only the names of the chiefs of the land, but very little about their actions."

The phrase, "men who dwelt in mountains," supports de Grazia's characterization of the survivors.

Note 5 --

The linguistic analysis by de Grazia and others exemplifies the impact that Homer's writings and language had in subsequently unifying the geographically widely separated Greeks. Alfred de Grazia writes:

"Homer used metaphors of the clearest and most ordinary kind, to the exclusion of far-flown and fancy comparisons. His poetry seems to be addressing audiences of low verbal ability; or they might have understood a melange of dialects and phrases, a lingua greca like a lingua franca or both. On the other hand, his similes are prolonged and complicated, dealing with rural and pastoral comparisons."

"More significant is the non-use of a sacred, liturgical language. If there had been a Mycenaean dead language, like classical Greek is to modern Greek, or Latin to Italian, then would not that have been the basis for portions of the epic poems? But it was not, not even for prayers. Therefore it did not exist. Mycenaean Greek was probably a living and related set of dialects whose standard expression had disappeared with its ruling class and scribes."

"The linguistic melange (with its numerous catch-phrases of all Greek sub-cultures), which was Homeric Greek, was 'instant prosody.' There had been no time, no more than a couple of generations, to build an epic language. Yet such an epic language would surely have evolved smoothly and uniformly over the several centuries of any 'Dark Ages.' What emerges therefore is a people and culture exploding in space and time,

whose language, that of Homer, had not yet caught up with its expanding front."

By 600 BC the Greeks of Asia Minor make a concordance of Homer's vocabulary and are unable to place or define many of his words. It should be noted that Homer probably reintroduced the alphabet to the Greeks, since it seems clear that his works were not recited for 400 years, as conventionally understood, but written down.

Note 6 --

The iconography of the Maya, as well as the Quiche *Popol Vuh*, describe a direct connection between Mars and Earth by having Mars (K'awil, in Mayan; Tohil in Quiche) stand on a single leg, often a snake, which is a representation of lightning, reaching down four or five diameters from the bulbous body (or head) of Mars.

Mars, lacking a magnetic field and atmosphere, would have shown with a surrounding dust-laden plasma coma which would have been very little larger than the actual planet.

Note 7 --

Only where Mars came closest to Earth could mountain ridges be generated (claimed by Patten and Windsor). The mountain ridges (if any) would be formed in strips parallel to latitudinal lines. There are, however, only a few. Similarly, as the Earth rotated, the electric arc of Mars would travel at nearly the same latitude around all of the Earth. The seasonal tilt of the Earth has no influence on this, despite the claims to arc-shaped mountain ridges made by Patten and Windsor. There would be widening of the area devastated by lightning, and lessening, for Mars would shift north or south on its orbit in moving past Earth.

Without needing to find the length of Mars's orbit, or the lateral separation distance to Earth, the latitudinal movement of Mars can be found as,

$$\pi * 8000 * \tan(1.85/\text{deg}) = 811 \text{ mi.}$$

Where $\pi * 8000$ is the circumference of the Earth, and thus approximately equal to the horizontal distance traveled by Mars in one day with respect to the surface of Earth. The orbit of Mars is inclined at 1.85 degrees to the ecliptic (which is the orbit of Earth). Thus in one day (one rotation of Earth) Mars will move "up" or "down" by the circumference multiplied by the tangent of 1.85 degrees, while advancing along its own orbit next to Earth.

The value of 811 miles can be compared to the separation of locations of recognized damage by Mars. The distance from Athens to Scotland (at latitudes of 38 degrees and 56 degrees north) is 1242 miles. The distance from Mexico City to Arizona (at latitudes of 19.4 degrees and 34 degrees north) is 1007 miles. Both of these are close to the value of the expected

creep northward of Mars, after allowing for another 1000 miles lateral movement.

We could calculate backward on the same basis of the latitudinal distances (1442 and 1007 miles), to calculate how long it would take Mars to travel this far north. That turns out to be 1.23 and 1.52 rotations of the Earth (not counting longitudinal differences), and thus provides a measure of how long it would take Mars to pass Earth.

Note 8 --

De Grazia suggests the deposition of iron ores (iron oxides) at the time of these close approaches of Mars. But disassociated ferrous and ferric iron ionize positively, and would have remained at Mars, under the assumption that Mars represented the cathode during lightning strikes. De Grazia bases much of this on the association of the start of iron smelting and forging -- the start of the "Iron Age" -- with the two centuries when these events happened. Iron ore is not confined to horizontal bands in the northern hemisphere, as it should be if it was deposited by Mars.

Note 9 --

There is a third companion or satellite of Mars mentioned by Homer ("Discord" or "Strife"), which is missing today. However, the description is closer to a rising stream of plasma, reading, "Strife, whose fury never tires, sister and friend of murderous Mars, who, from being at first but low in stature, grows till she uprears her head to heaven, though her feet are still on earth."

Jonathan Swift wrote the following in *Gulliver's Travels* (AD 1726):

"They [the Laputans] have likewise discovered two lesser Stars or Satellites, which revolve about Mars, whereof the innermost is distant from the Centre of the Primary Planet exactly three of his Diameters, and the outermost five [Diameters]; the former revolves in the Space of ten hours, and the latter in twenty-one and a half."

He follows this with some mathematical information. The information is nearly correct, and involves Keplerian and Newtonian mechanics. Swift knew both Isaac Newton and Edmund Halley, although neither knew of the satellites of Mars. No telescope could resolve the satellites until 1877, 150 years after Swift. The actual distances are 0.4 and 3.5 diameters and the periods of rotation are 7.5 hours and 30 hours. Patten and Windsor make the following observation in *The Mars-Earth Wars* (1996):

"At that time, in 1725 and 1726, astronomers did not know the diameter of Mars. Laputans disclosed the distance of Phobos and Deimos from Mars not in English miles but rather in Mars diameters. Astronomers in the early 1700's did not know the accurate

value for the length of the astronomical unit. And they didn't know how far Mars was from the Sun. This unit of measurement in the satire suggests a very ancient sketch was involved, or a copy thereof from the Catastrophic Era."

Isaac Asimov, in *The Kingdom of the Sun* (1960), dismisses Swift's claims as a lucky guess, but then writes:

"However, his guess that Phobos would rise in the west and set in the east because of its speed of revolution is uncanny, it is undoubtedly the luckiest guess in literature."

Others have suggested that the information came from China or Japan during the 18th century. Swift places Laputa as a small island off the coast of China.

Note 10--

Although the Aztecs arrive very late to Central Mexico (AD 1100) they derive the qualities of their war God (Huitzilopochtli) from the Toltecs (since circa AD 800) whose war-like God (initially Xipe Totec) had been imported into the region. The people of the earlier classical phase, as at the ceremonial city of Teotihuacan, lasting from circa 200 BC to circa AD 700, had worshipped more benign deities (as far as we know).

It was visitors from Teotihuacan, however, who introduced a magic shield consisting of a flayed human face to the Maya, along with a considerably less effective dart thrower. The genesis of the flayed face, as a mask or shield is clearly seen in earlier Olmec sculptures.

Note 11 --

The year 687 BC is four 15-year periods after 747 BC, thus suggesting 5 close passes of Mars if 747 BC is included. The year 702 BC is three 15-year periods after 747 BC, equivalent to four close passes.
